AXUM, once the capital of the Ethiopian kingdom of the same name, is situated in the modern Abyssinian province of Tigré, west from Adowa. Lat. 14° 7′ N.; long. 39° 27′ E. It now lies in ruins, among which stands the principal church of Abyssinia, built in 1657. The former greatness of the city is testified by yet remaining str cut in granite, some of which have inscri From these it appears that the Axumite extended over Abyssinia, and even over and Saba in Arabia, and possessed the co of the Red Sea. It acquired political imp from the circumstance, that it formed on th a boundary to the world-embracing power of as well as to that of Parthia, which then ex as far as Arabia. The Byzantine emperors ev an annual tribute to the sovereigns of A country was also the furthest point a Grecian civilisation reached; through of Egypt, Greek philosophy spread int Greek language became the language of th and of the priests. Under King Aizanes, wh still remaining inscription, appears as a h Christianity was introduced into the countr Egypt by the two apostles Frumentius and Æ who were followed by many priests from th quarter. The new doctrine soon spread ov whole country; Frumentius was made th Bishop of A., and Fremona was built in hon him. The stone churches, many of them very ing, yet scattered over the whole of Abyssin their architecture to Egyptian priests, and a that period, as well as the most celebrated convents and hermitages. The A carried on, through Adule, an active Arabia and India; it formed the out of Christianity; and, as such, particu the 6th c., it interfered in behalf of the Christi Arabia, and became the natural enemy of M medanism. The contests in which it soon b involved with that power caused its fall, as the gradually lost their possessions in Arabia, a whole coast on the Red Sea and Gulf of Aden outlets for commerce were thus cut off, an empire was at the same time so weakened b stant wars, that internal disorders brought complete dissolution.

AYACU'CHO, a town in a depa same name in South Peru. Here, on the ber 1824, the combined forces of Peru —the latter then comprising Ecuador, New and Venezuela—totally defeated the last army that was ever seen on the new contin

AYA'LA, Pero Lopez de, called El Vi distinguish him from his son of the same nam born at Murcia in 1332, of one of the first fami the Castilian nobility. He stood high in the f of several kings of Castile, and filled fi of the state, latterly, that of high- high-chamberlain of Castile. At the in 1367, he was taken prisoner by the in league with Peter the Cruel, and some time in an English dungeon; and a by the Portuguese, at the battle of Aljub died at Calahorra in 1407. A. has a name, not only as a statesman, but as especially as a historian and poet. His best work is his *Crónicas de los Reyes de Cas Pedro, D. Enrique II., D. Juan I., D. Enriqu* (2 vols. Madr. 1779–80—the older editions of and 1591 are imperfect). He was the first the Spaniards to give up the usual s of events in the order of time, and to a more rational representation of them the rules of historic art. It is only in that the poetical works of A. have been the most remarkable of which is the *Libro de Palacio*. This Book in Rhyme on C its singular title may be translated, was be the poet's first captivity in England, and is in the old national form of rhyming Al

stanzas of four lines; the contents are satirical and didactic. A. appears also in his poetical works as a representative of that transition epoch of Spanish national literature, when it was passing from a popular original literature to one of a more artificial imitative character.

AYE-AYE (*Cheiromys Madagascariensis*), a quadruped about the size of a hare, a native of Madagascar, which was at first placed by naturalists among Squirrels, and was ranked by Cuvier along with them in the order of Rodents (*Rodentia*), although Sonnerat, who discovered it, pointed out its affinity also to the Makis or Lemurs, to which family it is now pretty generally referred. The principal reason for placing the A. among the *Rodents* has been found in the conformation of its teeth; but

Aye-aye.

other characters of the animal agree generally those of the Lemurs, and its habits resemble . The A. has large broad ears, large round ong brownish gray hair, and a large bushy tail. it does not carry over its back as squirrels as is very active during the night, but sleeps g the day. In confinement, it will subsist on rice and fruits. It seems to be able to make al use of its front teeth for gnawing as any Rodents (Gnawers). Mr Ellis mentions one ch ate its way through a barrel, and made its e. He thinks it probable that there are more than one.

AYESHAH, the favourite wife of Mohammed, born at Medina in 610 or 611 A.D. She was —y nine years of age when she married the phet. Her father's name was Abdullah, but he as surnamed Abu-Bekr, 'father of the virgin,' in consequence, it is said, of his daughter being the only one of Mohammed's wives who was a virgin. Although A. bore no children to Mohammed, she was so tenderly beloved by him, that he was wont to say that she would be the first of his wives to whom the gates of Paradise would be opened. It is stated by Mohammedan historians, that to the charms of her beauty she added a knowledge of mathematics, rhetoric, and music. But this statement is improbable. She was accused of adultery, but Mohammed having produced a revelation from Heaven to the effect that she was innocent, punished her accusers, and made it an article of faith for all time, that whoever should not believe in her purity should endure the pains of hell for ever. In his last illness, Mohammed, by his request, was carried to her house, and expired in her arms. After the Prophet's death, A. took an active part in the plot which deprived Kalif Othman of his power and life, and headed a force to resist the accession of Ali. After some partial success, however, the troops under her were effectually defeated by Ali, and she was taken prisoner. Ali spared her life, and allowed her to reside in any town in Arabia she chose, provided she did not interfere with state affairs. She died at Medina (677 A.D.). In spite of her political adversities, A. was highly venerated by all true Mussulmans, and named the *Prophetess*, and the *Mother of Believers*. She was consulted on divers points of the Koran, and her interpretations were held to be binding. They have been collected in the *Sunna* (q.v.).

AYLESBURY, a town in the centre of Buckinghamshire, on a rivulet which flows into the Thame, an east branch of the Thames. It lies high above the vale in which the rivulet runs, which often causes a scarcity of water in the town. Pop. (1871) 28,760. A. returns two members to parliament. It is chiefly an agricultural town, but the inhabitants also engage in straw-plait, lace, and silk manufactures. Many ducks are reared for the London Christmas market. A. is a very ancient town, having been taken from the Britons by the Saxons in 571.

AYLESFORD, a village near the centre of Kent, on the right bank of the Medway, 3½ miles north-east of Maidstone. Remarkable ancient remains occur here. On a hill-slope a mile and a half to the north-east, there still stands a celebrated ancient dolmen, or burying-place, called Kits Coity House—a small truncated pyramidal chamber, open in front, and formed of four large rude Kentish rag blocks, three of which are uprights, with a slight slope inwards, and the fourth laid on them. Of the side-stones, one is 7 by 7 feet, 2 feet thick, and 8½ tons in weight; the second is 8 by 8½ feet, weighing 8 tons; and the third is smaller and more irregular in form. The capstone is 12 by 9½ feet, 2½ feet thick, and weighs 10½ tons. This dolmen seems to have been the centre of a group of ancient monuments connected by a long stone avenue with another group, 7 miles to the south-east. In this district also occur, on the brow of the chalk-hills on both sides of the Medway, large circular sepulchral pits, opening at bottom into one or more chambers. Some of these pits are covered with flat stones, and filled with flints. At A. the Britons defeated the Saxons in 455, and drove them from the island; but early in the 7th c. the Saxons were victorious here.

AYLOFFE, Sir Joseph, an English antiquary of celebrity, born about 1708 in the parish of Framfield, Sussex. In 1731 he was elected a Fellow of the Royal Society, and in the following year, a Fellow of the Society of Antiquaries. He was one of the first council of this Society, after it received its charter of incorporation in 1751; and he was made vice-president some years after. When the new State-Paper Office was established in 1763, he was made one of the commissioners for the preservation of the state papers. In 1772, he published a valuable work on the national records. He also wrote several useful papers for the publications of the Society of Antiquaries; and projected, and was engaged in the execution of the work, afterwards continued by Gough, and known as Gough's *Sepulchral Monuments*, at the time of his death in 1781.

AYMAR, Jaques, a celebrated French professor of the art of divination. A. was the son of a peasant of Dauphiné, and was born at St Veran in September 1662. He was brought up as a mason, but he forsook that trade for the divining rod, which he used at first to point out springs, hidden treasures, &c.

In 1692, a murder and robbery was committed at Lyon, and A. and his rod were called into requisition to detect the criminals. In some way or other, he succeeded in discovering one of the guilty parties. A.'s fame having been spread by this incident, he was called to Paris to exhibit his art before the Prince de Condé; but, unfortunately for his reputation, his power of divination utterly failed him; and being forced to confess himself an impostor, he was sent back in disgrace to his original obscurity.

AYMON, the surname of four brothers, called respectively Alard, Richard, Guiscard, and Renaud, sons of Aymon or Haimon, Count of Dordogne, who figure among the most illustrious heroes of the chivalric poetry of the middle ages; but their historic existence must be considered problematical, as the deeds attributed to them possess in so large a measure a miraculous character. What basis of fact may underlie the fanciful accretions of mythology, it is now impossible to determine. Their career belongs to the cycle of marvels, of which Charlemagne is the central point, and their adventures furnished rich material to the romantic narratives of Italy in the 15th and 16th centuries, and, in fact, were the exclusive subject of some of these. A novel, entitled *Les Quatre Fils Aymon*, by Huon de Villeneuve, a French poet of the age of Philippe Auguste, details very minutely their exploits. Finally, Ariosto conferred a poetical immortality on the family by the publication of his *Roland*, in which Renaud, the bravest of the four brothers, plays continually the most distinguished part. The traditions concerning them are not uniform or consistent. Some have a Provençal origin; but the author or authors of the popular German book which Tieck has edited and published, entitled *The Beautiful and Entertaining History of the Four Brothers Aymon, and of their Horse Bayard, with the Deeds and Heroic Feats that they accomplished against the Pagans, in the Time of Charlemagne*, seem to have drawn from a different source. The most probable hypothesis, therefore, is, that the varieties in these poetic legends are due to the fancy and national predilections of the particular authors, and that there originally existed a single tradition, out of which the whole sprang.

AYR, the county town of Ayrshire, is situated on the left bank of the river Ayr, about the middle of the coast of Ayrshire, 40 miles south-south-west of Glasgow by rail. It lies in a coal district. A. is a clean and handsome town, and its principal streets are well built. To the south, between the town and the race-course, numerous elegant villas have recently sprung up. The spire of the Assembly-rooms is 217 feet, and the Wallace Tower, 113 feet high. The river is here spanned by three bridges - the 'Auld Brig' and 'New Brig' of Burns, and one built long after, to permit the Glasgow and South-Western Railway to be carried on uninterruptedly into Carrick. These connect the town with Newton-upon-Ayr. A. harbour is formed by the estuary of the river, and is protected on each side by a pier. A wet dock of considerable dimensions is about to be constructed, at a cost of about £140,000. The coasting-trade is considerable. The chief export is coal, 180,000 to 200,000 tons yearly being exported from the Ayr collieries. A considerable quantity of grain and timber is imported. At one time, much wine was imported from France. At an early date, A. was a commercial and military place of some importance. William the Lion made it a royal burgh about 1202. During the Scottish wars of independence, it formed a regular centre of military operations, and, while in possession of an English garrison, it was the scene (according to *Blind Harry*) Wallace's first exploits. The principal objects interest near A. are connected with the memory Robert Burns. See ALLOWAY KIRK. Pop. in 18 municipal burgh, 7987; of the parliamentary bur including Newton-upon-Ayr, 17,954. A. unit with Campbelton, Irvine, Inverary, and Oban, sending a member to parliament. In 1872—18 custom duties, £7723; registered shipping, vessels, or 8835 tons.

AY'RSHIRE, an extensive maritime county i the south-west of Scotland, bounded, N., by Renfrew shire; W., by the Firth of Clyde and the Nort Channel; S., by Wigton and Kirkcudbright; E and N. E., by Dumfries and Lanark. Its greate length is 78 miles; its greatest breadth, 26—averag 14½; area, 1149 square miles, or 735,262 statute acre It is the seventh in size of the Scottish counti The general aspect of the county is undulating an hilly, the land attaining no great elevation, ex a small portion in the north, and some consider able tracts in the south and south-east, whic are mountainous. None of the eminences excee 2000 feet. A. contains a great number of lake and small streams, the latter rising near th inland boundary of the county. The chief river —only 20 to 35 miles long—are the A its tributary the Lugar, and the Doon. T across the centre of the county; the C Irvine in the north; and the Girvan flows in the south. A. to the south of the Girvan co of Lower Silurian rocks, and to the north of river, of patches of Devonian, carboniferous, an trap rocks. It is rich in valuable minerals, esp cially coal, ironstone, limestone, and freestone The other minerals have been long wrought, bu it is only of late years that the working of iron stone has been established—and is now carried on a large scale in the north of the county. On banks of the Ayr, is found an excellent of whetstone, called Water-of-Ayr Stone. climate of A. is mild and healthy, but moist. soil along the coast is light and sandy, inte with deep loam; the most fertile districts are a centre of the county, where clay predominates. the east side are extensive mosses and moorla The three ancient divisions of the cou Carrick, south of the Doon, mostly wild Kyle, between the Doon and the Irvine, c much rich level land, but towards the co is light, and, though well cultivated, is l tive; and Cunningham, comprising all north of the Irvine, mostly fertile. The istics of these districts are rudely indica old country rhyme:

> Kyle for a man;
> Carrick for a coo;
> Cunningham for butter and cheese;
> And Galloway for woo.

Agriculture in A., till about 1800, was v ward; but since then, especially of late, extra nary progress has been made in furrow-drai improved rotation, and road-making; while dition of the peasants has been much improv 1872, 311,529 acres were under crops, by 3487 persons, the farms being gener Dairy-husbandry is carried to high pe Ayrshire, the breed of milch cows, of wh a greater number than any other Scotch being noted as the finest in the kingdom for tity and quality of their milk. Covenanters.

RER, Jacob, next to Hans Sachs the most
and important German dramatic writer of
c. His history is involved in obscurity;
known that he was a citizen of Nurnberg
, and a procurator in the courts of law. It
s till after his death, in 1605, that a collection
pieces was published, consisting of 66 trage-
omedies, and carnival plays (Nurnb. 1618). A.
e same garrulous breadth of dialogue as Hans
but is inferior to him in wit and humour.

TON, Sir Robert, a Scottish poet and favour-
urtier in the reign of James VI. He was a
er son of Andrew Ayton of Kinaldie, Fifeshire,
he was born in 1570. He was enrolled as a
t in St Leonard's College, St Andrews, in 1584,
ok his degree of M.A. in 1588. For purposes
dy, he next visited France, from whence he
ned, in 1603, an elegant panegyric, in Latin
to King James, on his accession to the throne
gland. This poem appears to have been the
f A.'s fortune, for we find him afterwards
ed, successively, one of the gentlemen of
chamber, private secretary to the queen, and
of requests. Subsequently, he held the
tment of secretary to the queen of Charles I.
James employed him to convey copies of one
works, conjectured to be his *Apology for*
of Allegiance, to the German courts. A.
terms of familiarity with all the most
nt men of his time—poets, wits, and philoso-
alike—among others, Hobbes and Ben Jonson.
s himself a poet of considerable merit; but,
unately, a large number of his effusions being
mentary verses to his friends, are characterised
cest and extravagant flattery. He was one
first Scotsmen who wrote in English with
gree of elegance and purity. His verses on
l topics 'are conceived in a refined and tender
of fancy, that reminds us more of the fairy
of Herrick than anything else.' Burns had
t admiration of some of A.'s pieces, two or
f which he paraphrased. A. is also said to
written verses in Greek and French, as well
as in English and Latin. Several of his Latin poems are preserved in the work called *Deliciæ Poetarum Scotorum*, printed at Amsterdam in 1637. A. died in Whitehall Palace, March 1638.

AYTOUN, William Edmondstoune, was a native of Edinburgh, having been born there in 1813. He received his education at the metropolitan university, and was called to the Scottish bar in 1840. In 1845, he was appointed Regius Professor of Rhetoric and Belles-Lettres in the university of Edinburgh; and after the formation of the Derby administration, in 1852, he was promoted to the shrievalty of Orkney and Shetland. He married a daughter of Professor Wilson. During many years, Professor A. devoted himself to literary work. The earliest work of his with which we are acquainted is entitled *The Life and Times of Richard I.*, published in 1840—a subject well treated, and singularly in consonance with his chivalrous and romance-loving nature. Despite his minstrel tendencies, he is a master of caricature and parody; and many of the most successful of the *Bon Gaultier Ballads* are understood to be from his pen. In 1849, he published the *Lays of the Scottish Cavaliers and other Poems*, which established his reputation as a poet of the school of Sir Walter Scott, and which has run through eleven editions. Among his subsequent writings are *Firmilian, a Spasmodic Tragedy*, published in 1854; and *Bothwell*, a narrative poem of considerable length, in the measure and manner of Sir Walter Scott, which was, after its first publication in 1856, to a large extent recast and improved. His edition of the *Scottish Ballads*, in 2 vols., appeared in 1858. In the ensuing year, he issued, in conjunction with his friend, Mr Theodore Martin, translations of various minor poems of Goethe, in one volume. He was for many years one of the most frequent and brilliant contributors to *Blackwood's Magazine*. Professor A. was successful in quite opposite departments of literature—he was distinguished at once as a poet and humorist. His poems exhibit a ballad like simplicity, and a fiery flow of narration—the special merits of the poetical school in which he graduated; while his tales—the best known and appreciated of which are *The Glenmutchkin Railway*, and *How I became a Yeoman*—possess a certain robust humour and farcical abandonment, and are related to the writings of the great masters of humour much in the degree that the 'screaming farce' is related to genteel comedy. His poetical powers appear in their greatest perfection in the *Lays of the Scottish Cavaliers*; the special merits of his humour are best exhibited in *How I became a Yeoman*. As a critic, he took up the knout of the dreaded Christopher North of the 'Noctes,' which he wielded with considerable dexterity and force. Professor A. died at Elinburgh, Aug. 4, 1865. His Life has been written by Theodore Martin (Lond. 1867).

AYUNTAMIENTO is the name given in Spain to the councils or governing bodies of towns. Sprung from the institutions of the Romans, and firmly established during the long struggles with the Moors, the ayuntamientos acquired great influence and political power, the more so that the nobility were not excluded from them. Although this importance was impaired through the insurrection of Juan de Padilla in 1521; and at a later period, under the Bourbons, the last shadow of municipal freedom was lost; the remembrance of it continued to be cherished by the people. Accordingly, the cortes of Cadiz, in 1812, took up the leading features of the former system, adapting them, by more democratic modifications, to the requirements of the time. On the return of Ferdinand VII., the ayuntamientos were abolished; they were again restored by the

cortes, in 1823; and after the invasion by France, once more set aside. During the civil war, various proposals were made regarding the ayuntamientos; but at last the arrangements of 1812 were confirmed by the constitution of 1837. According to that statute, the A., with the alcalde as president, is appointed by the free choice of the people, and is entitled to exercise the highest functions within the circle of its jurisdiction. The government can provisionally annul its acts, but must afterwards procure the ratification of the cortes, by which alone an A. can be dissolved. The ayuntamientos are empowered to make up the lists of electors and jurors, to organise the national guards, to command the police within their own bounds, to direct the apportionment and raising of taxes, and to manage the funds of the commune. In 1840, a bill was brought into the cortes, formed on the model of the French law, proposing to deprive the ayuntamientos of all political power, and restrict their functions to purely municipal matters, and also to limit the franchise to the most highly taxed. But the insurrection which this step excited, and which ended in the expulsion of the queen, Maria Christina, prevented the project from being carried out. At last, in 1844, a law, similar to that proposed in 1840, was, through the intriguing of Christina, supported by French influence, adopted by the cortes, then composed of moderados; and this law, with little alteration, continues in force to the present day.

AZA'LEA, a genus of plants belonging to the natural order *Ericeæ*, and distinguished from Rhododendron (q. v.) chiefly by the flowers having five stamens instead of ten. Most of the species of A. also differ from the rhododendrons in having

Azalea Indica.

thin deciduous leaves. Some botanists unite the genus *A.* to *Rhododendron*. One of the species best deserving of notice is *A. Pontica*, a shrub from three to five feet high, a native of the countries around the Black Sea, with large obovate or oblong-lanceolate shining leaves and umbellate yellow flowers, which are externally covered with glutinous hairy glands, and are very fragrant. It may be regarded as, like many of the other *Ericeæ* (heaths, &c.), a *social* plant; and its golden flowers give great brilliancy to the landscape in many parts of Crimea, the south-east of Poland, the Caucasus. It covers many mountain slopes, but does ascend to great elevations, giving place to the alpine *Rhododendron Ponticum*. It is comme gardens and shrubberies in Britain, and varies orange, red, and almost white flowers. The plant is narcotic and poisonous, and the honey lected by bees from its flowers, which abound in honey, is said to cause stupefa delirium, as happened to Xenophon's soldiers famous retreat in Asia.—North America abo in azaleas as well as in rhododendrons, and som the species have been long cultivated in Britain ticularly *A. nudiflora* and *A. viscosa*, which, *Pontica*, have become the parents of many hy Both have nearly white flowers, very beautiful, of delicious fragrance. *A. viscosa* has the flo covered with glutinous hairs like *A. Pontica*: the flowers of *A. nudiflora* are nearly de them. Both species abound from Can southern parts of the United States. taller shrubs than *A. Pontica*. Upon ac its sweet smell, *A. nudiflora* is called in the Upright Honeysuckle. *A. calendulac* native of the southern parts of the United St is described as frequently clothing the mount with a robe of living scarlet.—India and C produce several species of A., of which one of finest is *A. Indica*, well known in Britain greenhouse shrub. Its flowers exhibit great liancy of colours. Many hybrids exist between more hardy species and this. Another extre beautiful species is *A. ledifolia*, an everer has been introduced into Britain from

A diminutive, procumbent, evergree native of alpine regions in Europe a America, plentiful on high mountains in was long known as *A. procumbens*, but is now *Loiseleuria procumbens*. The flowers are small rose-coloured. The whole appearance of widely differs from that of the genus Azale

AZE'GLIO, MA'SSIMO MARQUIS D', famous artist, a publicist, a romance-writer, and a man, was the descendant of an ancient an family of Piedmont. He was born in 1798 at where his father held a high military position fifteenth year, A. followed his father to where he had been appointed ambassador, an contracted a love for the fine arts; but his st music and painting was cut short by curing him an appointment in a Pied regiment. Here A. devoted his l intensity to scientific pursuits, that an illness which forced him to quit t journey to Rome, from which he returned 1820, restored his health, but deepened his pa painting. After some difficulty, he got his permission to devote himself entirely to A year had hardly elapsed ere A. had made a name in Rome as an artist. In landscape-pa he soon attained complete artistic L residence of eight years at Rome, he had pursued the study of history painting, he returned to Turin. On his father in 1830, he went to Milan, w was then flourishing. In Milan he made ship of Alexander Manzoni, whose d married. A. now began to make himself k known also in literature, his novels, *Ettore moro* (1833), and *Niccolo di Lapi* (1841) done much to fan the national spirit of The political affairs of Italy soon occupied exclusively; he traversed the provinces, entered villages, seeking to stir up the spirit of natio and to conciliate the unhappy party

anywhere received with rejoicing and acclamation. A. never belonged to a secret political society, but opposed conspiracies as mischievous, and counselled the impatient to moderation. While [illegible] he wrote his famous piece, *Degli ultimi casi di Romagna*, in which he lashed the misgovernment, denounced the vain attempts at revolution, and proved to the Italian princes that [illegible] a national policy. After the election of Pius IX. as pope, A. returned to Rome, where his influence were ascribed the reforms which Pius began his government. He was [illegible] re at this time, and wrote much on [illegible] ics. (An edition of his political writings, collected in one volume, appeared at Turin, [illegible] en Charles Albert, after the rising of Italy, crossed the Ticino, A. left Rome with [illegible] al troops destined to support the Italian [illegible] In the battle of Vicenza, where he commanded a legion, he was severely wounded in the [illegible] hile fighting at the head of his troops. [illegible] was he recovered, when with his pen he [illegible] r opposed the republican party, now [illegible] with victory. On the opening of the [illegible] iament, he was chosen a member of [illegible] of Deputies. After the unfortunate battle of Novara, the young king, [illegible] uel II., appointed him (1849) president of the cabinet, an office which he undertook [illegible] of love to his king and country. His [illegible] ce in this high position was most beneficial. [illegible] close of the war in 1859, A. was appointed [illegible] spore General and Commissioner Extraordinary, [illegible] surely military, for the Roman States. On [illegible] irement, he issued a proclamation to the [illegible] which greatly tended to strengthen their [illegible] ion by its noble yet temperate advice. He [illegible] the 15th of January 1866. Since his death, [illegible] al *Correspondence*, and other writings from [illegible] have been given to the world; and his [illegible] *ranky* has been published by his daughter.

JA'N, or ADERBAIJA'N, the ancient *Atropatene*, is the most northerly province of Persia. It is situated between lat. 36° and 40° N., long. 44° and 48° 40' E.; bounded on the S. by Kurdistan and Irak, E. by Ghilan, N.E. and N. by the Russian territory, and W. by Turkish Armenia. It has an area of about 30,000 square miles, and a population of 2,000,000. The surface is very mountainous, many of the ranges rising 7000 to 9000 feet in height. The peak of Sawalan (an extinct volcano) reaches an elevation of 14,000 feet. Mount Ararat rises on the northern border. The chief rivers of A. are the Araxes, the Kara Su, and the Kizil-Uzen. The lake Urumiyah or Urumiyeh (q. v.), the largest in Persia, is situated on the western border of the province. The climate of A. is not unhealthy, but is subject to the extremes of heat and cold. The transition from cold to heat is very rapid. In the mountainous districts, the hail-storms are occasionally so violent as to kill cattle. The principal products of A. are rice, barley, wheat, millet, flax, hemp, cotton, tobacco, honey, and silk; camels, horses, cattle, and sheep are also reared; velvet, silks, stuff, carpets, woollens, and cottons are the most important articles of manufacture, and a little is done in hardware. Lead, copper, sulphur, saltpetre, and salt are found in the province. The capital of A. is Tabriz, with a population of about 30,000. It has suffered severely from earthquakes. The other towns of note are Urumiyah, on the lake of that name; Sulduz, famous as the place where Nasir Eddin, the astronomer, fixed his observatory; Miana, Khoi, Maraga, and Ardebil.

AZIMGHU'R, or AZIM'S FORT, a name primarily applied to a town in India, and thence extended to its district. 1. The town is in lat. 26° N., and long. 83° 14' E. From Calcutta it is 448 miles to the north-west; from Benares, 81 to the north; from Allahabad, 109 to the north-east; and from Lucknow, 171 to the south-east. It is situated on the north-eastern Tons, a considerable offset of the Gogra, which is here crossed by a bridge of boats, and which is navigable downwards, a distance of 40 miles, to its confluence with the Surjoo. The town is estimated to contain about 14,000 inhabitants, besides the troops in garrison. During the mutiny of 1857, A. was, so far, a creditable exception to the general rule of ruthless cruelty among the insurgents. The sepoys did indeed mutiny, actuated, apparently, by a wish to appropriate a passing treasure of 7 lacs of rupees, or £70,000 sterling. But, having formed a square round their officers, and sworn to protect them, they brought carriages for them and their families, and escorted the whole ten miles towards Ghazeepore.—2. The district stretches in N. lat. between 25° 36' and 26° 24', and in E. long. between 82° 45' and 84° 12'. Its area is stated to be 2550 square miles; and its population to be 1,385,872. This gives the average of 543 persons to the square mile. This exceptionally high average is the more remarkable from the circumstance that there are few, if any, populous towns in the district besides the capital. The district is low and remarkably level. The soil is fertile, excepting that a few tracts are irreclaimably barren, from being impregnated with soda, nitre, and other saline substances. There are tolerably extensive manufactures—the silk looms being 3122, and the cotton ones, 10,560. Connected with the latter is the curious fact, that scarcely any cotton-wool is produced on the spot.

AZIMUTH. The A. of a heavenly body is the angle measured along the horizon between the north or south point, and the point where a circle, passing through the zenith and the body, cuts the horizon. The word comes from the Arabic, and is said to be derived from a word signifying a quarter of the heavens. It is usual to measure the A. westward from the point most remote from the elevated pole, beginning at 0°, and returning to it at 360°. Thus, in northern latitudes, where the north pole is elevated, the A. is measured from the south point, so that the east point, for instance, has an A. of 270°. See ALMUCANTARS, or ALMICANTARS, or ALMICANTARY SPHERE. A. circles are those which extend from zenith to nadir, cutting the horizon at right angles, or those in which all the points have the same azimuth.

AZINCOURT, or AGINCOURT, a village in the department of Pas-de-Calais, France, celebrated for a bloody battle between the English and French, October 25, 1415. The internal distractions of France under the imbecile Charles VI. (q. v.) had encouraged England to attempt to make good her ancient claims on France. Henry V. of England had landed at Harfleur, had taken that fortress, and wished to march through Picardie to Calais, in order to go into winter-quarters. The Dauphin advanced against him with a powerful force. A great number of the nobility accompanied him; and so great was their confidence, that the offered aid of the Duke of Burgundy and of the city of Paris was rejected. Henry hastened to the Somme, but was followed by the French, who opposed his passage; he at last managed to cross with his army at St Quentin. Greatly weakened in numbers, and suffering extremely from want of provisions, Henry offered to purchase peace by reparation of injuries. But the French would not

hear of a treaty, as they entertained the hope of completely annihilating the English army. They had, in fact, intercepted the English march to Calais, by getting possession of the high road behind the little river Ternoise, near the villages of A. and Framecourt. The invading army, therefore, still (according to French accounts) 14,000 strong, of whom 2000 were men-at-arms—though no English writer makes it more than 10,000—prepared for an engagement by posting themselves between two woods, in a single line of battle, with the archers on the wings. The French, to the number of 50,000, under the command of the Constable, D'Albret, were drawn up in two lines, the men-at-arms, of whom only 2000 were mounted, being in the first. The English were the first to begin the onset. The French cavalry rushed forward to meet them, but were received with such a storm of arrows that they took to flight, threw themselves upon the first line, and put it into disorder. On this, the light-armed English archers took to their bill-hooks and hatchets, broke into the ranks of the men-at-arms that fought on foot, whose heavy armour and close array rendered them almost incapable of resistance, and made the greatest havoc among them. This being followed by a charge of the English horsemen, the first line took to flight, the second was unable to arrest the victors, and the whole French army was soon completely dispersed. The victory was decided. For a moment, Henry believed that the rallying masses were going to renew the fight; and hearing also that a troop of armed peasants were plundering his baggage, he gave orders to slay all the prisoners taken. The order was already executed when he discovered the groundlessness of his alarm. As many as 10,000 Frenchmen were slain, among whom were the Constable and six dukes and princes, the Duke of Brabant, the Count of Nevers, the Duke of Alençon, the Duke of Bar and his two brothers. Five princes, among them the Dukes of Orleans and Bourbon, were taken prisoners. The English lost 1600 killed, including the Duke of York, the king's great-uncle, whom the Duke of Alençon slew. Alençon had even struck the crown from King Henry's head, when he was surrounded by all present, and fell with many wounds. Henry, however, was too weak to pursue his advantage, and therefore continued his march to Calais, where he embarked for England.

AZO'RES, a cluster of islands in the Atlantic, 800 miles due west of the southern half of Portugal, ranging in N. lat. between 36° 55′ and 39° 44′, and in W. long. between 25° 10′ and 31° 16′. In the first half of the 15th c., the A. were discovered by the Portuguese, or rather, it has been said, appropriated by them, after having been revealed to them by a Flemish navigator, Joshua Vanderberg of Bruges. They were at that time uninhabited—a fact which, so far as it goes, seems adverse to any notion that America could have been colonised from Europe in this direction. That the A. were visited by the Carthaginians is proved by Phœnician coins found on Corvo. As early as 1436, they are marked on a map of the world by the Venetian Andrea Bianco. The Portuguese colonists called the whole group A., from *acor* or *azor*, a hawk; and they named two individual islands Corvo and St Jorgo, from Corvos Marinos and St Jorsi, which, according to the maps of the 11th c., had been previously seen in the western ocean. In 1466, Alfonso V. made a life-grant of the island of Fayal to his aunt, the Duchess of Burgundy, and from this circumstance many settlers migrated thither from Flanders. Without reckoning mere rocks, the islands are nine in number. Taken from east to west, they are as follow: St Mary, St Michael, Terceira, Graciosa, St Jorgo, Pico, Fayal, Flores, and Corvo. The area of the group is estimated at 980 sq. miles; while its population is 252,480, yielding an average of nearly 260 to a square mile. In the order of population and importance, the islands stand thus: St Michael, Terceira, Pico, Fayal, St Jorgo, Flores, Graciosa, St Mary, and Corvo. The A. are still a dependency of Portugal. Their capital is Angra, in Terceira; but Ponta Delgada and Ribeira Grande, both in St Michael, are larger towns.

As may be presumed from the density of the population, the soil is fertile, and the climate healthy. The islands are also well watered. The exports are oranges, wine, brandy, grain, pulse, pork, beef, cheese, and coarse linens; and the imports are woollens, cottons, hardware, iron, glass, cordage, pitch, tar, staves, timber, oil, fish, rum, coffee, sugar, salt, and tea. Perhaps the greatest want of the group is a good harbour. The A. are of volcanic origin—a fact from which may probably be inferred their identity with the Isles of Brazil or of Fire in the maps above mentioned, of the 14th c. Though most of the volcanoes themselves appear to be extinct, yet the islands contain hot springs, and are subject to violent earthquakes. The coasts are generally steep and rugged, while the interior parts abound in ravines and mountains. The mountains range from 1869 feet to 7613—the latter being the height of the lava-covered *peak* which gives name to *Pico*.

AZO'TE (Gr. *a*, depriver of, and *zōē*, life) is the name given by French chemists to Nitrogen (q. v.).

A'ZOTISED BODIES are those substances which contain azote or nitrogen as one of their constituents, and which form part of the living structure of a plant or animal, or are produced during its natural decay. The principal members of the group are *albumen*, present in white of eggs, and the juices of plants and animals; *globuline*, or *crystalline*, a variety of albumen found in the lens of the eye; *vitelline*, another variety of albumen, composing the greater bulk of the yolk of the egg; *paralbumen*, a third variety of albumen found in the animal system during certain diseases; *fibrine*, which occurs largely in the seeds of cereals and in animal muscle; *caseine* (or cheese matter), present in all milk; *legumine*, a variety of caseine found in pease, beans, and leguminous seeds in general; *gelatine*, which is present in the skin, bones, and other parts of animals; *chondrine*, a variety of gelatine obtainable from the cornea of the eye and the permanent cartilages; *isinglass*, another variety of gelatine manufactured from the inner membrane of the floating bladder of sturgeons and other [illegible] and *size*, which are secondary forms o[illegible] *urea*, *uric acid*, and *hippuric acid*, which [illegible] in the urine of the higher animals; *kreatinine*, occurring in the juice of [illegible] forms of *urinary calculi*, which are fo[illegible] in the bladder; and the very large and class of *alkaloids*, including strychnine, quinine, &c. The principal members of the of A. B. will be considered under their specia[illegible] ings; and the use of several of them as art diet will come into notice under FOOD.

AZO'TUS, the *Ashdod* of the Old T[illegible] (now Esdud), a village on the Med[illegible] miles south of Jaffa. Lat. 31° 43′ [illegible] 37′ E. It was formerly one of the chief the Philistines, strongly fortified, and the [illegible] numerous contests between that race and the [illegible] Into this city the Ark of the Covenant was b[illegible] by the Philistines, and placed in the temple o[illegible] god Dagon, whose image fell in pieces [illegible] it. In the 8th c. B.C., the town fell into the h[illegible] of the Assyrians; and in the following century

ery incredible story of how they had been
from the ancient city of Ixmaga, where
re reverenced as gods. A certain Señor
Velasquez, in company with a Canadian and American, penetrated into this ancient city of Central America, where they made the acquaintance of one of the guardian priests of these undersized deities, who was so charmed with the accounts of the outer world, that he resolved to steal the gods of his people, and escape with the strangers. One after the other—the Canadian, the American, and the priest—were overtaken by disaster, and Velasquez alone was left to tell the wondrous tale, with no attestation but such as the children themselves furnished. Professor Owen considered them mere dwarfs, and other authorities held a similar opinion. Belonging probably to some Indian tribe, they were doubtless monstrosities; and this becoming apparent, interest in them ceased.

AZTECS. The name of the dominant tribe in Mexico at the time of the arrival of the Spaniards. See MEXICO, ANTIQUITIES OF.

AZU'NI, DOMENICO ALBERTO, a distinguished jurist, born at Sassari, in the island of Sardinia, August 3, 1749. He early applied himself to the study of law, devoting himself particularly to the maritime relationships of nations. He became judge of the Tribunal of Commerce at Nizza or Nice; and in 1795, after that city had been taken by the French, he published a work in which he endeavoured to reduce maritime laws to fixed principles, and which, being recast, was published at Paris in 1805 under the title of *Droit Maritime de l'Europe*. The work was sufficiently anti-British in tone to secure its author the favourable consideration of Napoleon's ministry, by whom he was appointed one of the commissioners for compiling the new commercial code, the maritime portion being allotted to him. Genoa having been annexed to France, A., in 1807, was appointed president of the Court of Appeal there, where he remained until the fall of Napoleon. Among other things, A. published an *Essai sur l'Histoire Géographique Politique et Morale de la Sardaigne*, and a *Dictionary of Mercantile Jurisprudence*, and some controversial brochures. For some time after he had withdrawn from Genoa, he resided at Nice, and afterwards in his native island, where he was appointed, by King Charles Felix, judge of the consulate of Cagliari, and librarian to the university of that city. He died in January 1827.

A'ZURE, a French word technically used in Heraldry to signify blue. In engraving arms, it is always represented by horizontal lines.

A'ZURINE (*Leuciscus cærulens*), a fish of the same genus with the roach, chub, &c., and most nearly resembling the Red-eye (q. v.) or Rudd (*L. erythrophthalmus*), from which, however, it is readily distinguished by the slate-blue colour of the back, and the whiteness of the abdomen and fins. It is a fresh-water fish, and was first described by Yarrell from specimens received from Lancashire, where it is called the Blue Roach, but it is also an inhabitant of some of the lakes of Switzerland.

A'ZURITE, a name which has been given to the mineral more commonly called Lazulite (q. v.), and to which, along with Lapis Lazuli (q. v.) or *Azure-stone*, mineral turquoise (see TURQUOISE), &c., the generic name, *Azure Spar*, is sometimes given. —The name A. is also given by mineralogists to an ore of copper, generally known as *Blue Copper* (see COPPER), nearly allied to Malachite (q. v.), and remarkable for its beautiful azure colour.

B

THE second letter in the Hebrew or Phœnician alphabet, and in all alphabets derived from it, belongs to the order of labials, and is of the kind called medial or flat. See LETTERS, ALPHABET. Its name in Hebrew is *beth*, signifying 'house,' probably because its original hieroglyphic or picture form was an outline of a house or tent. In the corresponding words of sister-languages, we find *b* very generally replaced by some one of the other labial letters [*p*, *f* (*ph*), *v*]; these substitutions, however, take place not by chance or caprice, but according to ascertained laws. See PHILOLOGY, COMPARATIVE, and GRIMM'S LAW. The following are some examples of the interchange of *b* with other letters: Corresponding to Eng. *bear* are Sansc. *bhri*, Lat. *ferre*, Gr. *pherein*: Eng. *be*, Sansc. *bhu*, Lat. *fio* and *fui*, Gr. *phuo*: Eng. *bore*, Lat. *forare*: Eng. *of* and *off*, Gr. *apo*, Lat. *ab*: Eng. *wife*, plural *wives*, Ger. *weib*, Old H. Ger. *wip*: Eng. *web*, *weave*, *weft*: Gr. *episcopos*, Eng. *bishop*, Fr. *evêque*. In several Latin words, *b* arose out of *u* (pronounced like *v* or *w*). Thus, the original form of *bellum*, war, was *duellum* or *dvellum*; of *bonus*, *dvonus*; and the *d* being dropped (as we drop the sound of *k* in *knee*), the *v* became hardened into *b*. Similarly, *bis*, twice, is for *duis*. A remarkable interchange sometimes takes place between *b* and *m*, as in Sansc. *mri*, to die; Lat. *mort-*, death; and Gr. *brotos*, mortal.

The Greeks pronounced their *b* (Β) like a *v*, for they spelled *Virgilius*, e.g., *Birgilios*; and this continues to be the case in modern Greek. In Latin, during the classical ages at least, the letter was pronounced as it is in English, French, &c. But in the time of the later emperors (beginning with the 3d c. of our era), *b* was softened down, in the popular language at least, to a slovenly sound like *v*; for in inscriptions of this period, such spellings as *verve* for *verba*, *miravili* for *mirabili*, are quite common. The distinction between the two sounds being once lost sight of, the letter *b* was frequently substituted for *v*—as *berba* for *verba*, *bivus* for *vivus*. This softening of *b* into *v* in the middle-age Latin, has left traces in the modern Italian and French; as Lat. *habere*, Ital. *avere*, Fr. *avoir*; Lat. *tabula*, Ital. *tavola*. A Spaniard, on the contrary, has a tendency to use *b* instead of *v*; thus he pronounces *vivere* like *bibere*, and *Jovis* as if written *Jobis*.

B, in Music, is the seventh degree of the diatonic scale of C, and the twelfth degree of the diatonic-chromatic scale. In harmony, it is called the major seventh. According to the tempered system of tuning, the ratio of B, to the fundamental note C, is $\frac{15}{8}$. In the ancient diatonic scale, B was never used as a key-note, as its fifth, F, was imperfect. In the German notation, B is called H, while B flat is called simply B. B flat is half a tone lower than B, and in harmony is called the flat seventh. As a harmonic arising from C, B flat, as produced by nature, is considerably flatter than in the tempered system of tuning.

BAAL, a Hebrew word signifying *lord*, *owner*, or *master*, and applied as a general title of h to many different gods. In Hosea ii. 16, it tioned as a name which had been given to himself; but when used with the definite artic it specially designated the principal male deity the Phœnicians and Carthaginians, as Baalim Astarte was the principal female deity. In conn tion with Babylon and Assyria, the name B is spoken of under the name of Bel or Originally, B. was the god of the sun, and vivifier of nature, and Astarte the the moon. In the later star-worship of the west Asiatic nations, B. was the name of Jupiter, t planet of fate, or, as some suppose, of Satur The proper Phœnician name of B., however, w Melkart, Melkrat, or Melchrat, which supposed to mean 'king of the city'—, but others consider it a contraction of two wo signifying 'king of the earth;' while the l

Selden is of opinion that it is equi king.' B. was perhaps the Phœnician Moloch. The Greeks Melkart with their own Hercules; and, pose of distinction, termed him the Tyrian From the earliest foundation of Tyre, he seems to have been the tutelar god of that city, and his worship apparently extended thence until it was prevalent in all the towns of the Phœnician confederation, and was established in their remotest colonies, such as Malta, Carthage, and Cadiz. It also overspread the neighbouring countries of Assyria and Egypt. Each country or locality had its B. or chief god. According to Scripture, the temples of this idol (at least in Phœnicia and Assyria) were built on the tops of hills, or still more frequently in solemn groves, and sometimes altars

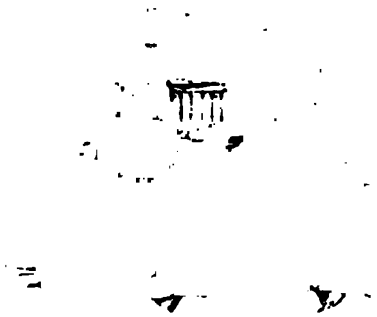
qa, chap. xviii., we read that the priests
ced about the altar during the sacrifice,
arously cut and mangled themselves, if
did not speedily answer their prayers.
rd B. enters into the composition of
hrew, Chaldee, Phœnician, and Cartha-
s, such as Jezebel, Hasdrubal ('Help
al'), Hannibal ('Grace of Baal'), Ethbaal
Baal'), Baal-bec ('City of Baal'). The
so also frequently found in conjunction
some epithet, and in such cases appears to
denote a different deity, though it is not
sible that it may have been the same person
ed in another aspect, and as exercising
a different function. Thus, we have Baal-
'the Covenant Lord,' who was specially
ed by the people of Shechem; Baal-Peor,
pus of the Moabites and Midianites; and
b. or Baalzebub (the Fly-god), the idol of
es at Ekron, where he had a temple.
deity Beal is usually identified with Baal.
s.

A'LBEK, the name of a ruined city in the
Cœle-Syria, signifies the 'City of Baal,'
gel, and was by the Greeks, during
cacide dynasty, converted into Heliopolis.
4' 1' 30" N., long. 36° 11' E. It is situated in
of Buká'a, 'at the northern extremity of a
of bleak hills, about one mile from the
tilebanon,' in a well-watered and delight
ality, rather more than 40 miles north-west of
cus. It was once the most magnificent of
cities, full of palaces, fountains, and beautiful



Ruins of Baalbek.

nts. It is now only famous for the splendour
ains, of which three deserve special notice.
most imposing is that of the great Temple of the
which was a rectangular enclosure, 280 feet by
aving its roof supported by a peristyle of
rinthian columns, 10 at each side and 10 at
end.' Of these, six are yet standing. The
ference of these columns is about 22 feet,
e length of the shaft 58; with pedestal, capi-
d entablature, they became about 89 feet in
. The approach to this temple was through
pacious courts, surrounded on all sides with
s and other buildings. Except the columns
ned, little of the great temple, or of the build-
front of it, is left standing, but the ground is
d with their ruins. The vast size of the stones
the substructions is remarkable, some of
being 60 feet long and 12 thick. South from
the great temple is a smaller one, known as the Temple of Jupiter. It is similar in form, having its peristyle and the walls of its cella still mostly standing. Its dimensions are 227 feet in length, by 117 feet in breadth, being thus larger than the Parthenon at Athens. Both temples, as well as the surrounding structures, are built of limestone, in a richly decorated somewhat fantastic Corinthian style. Besides these, there stands at the distance of 300 yards from the others a circular building, supported on 6 granite columns; style, mixed Ionic and Corinthian. It was once used as a Christian church.

The early history of B. is involved in darkness; but it is certain that, from the most distant times, it had been a chief seat of sun-worship, as its name implies. Julius Cæsar made it a Roman colony, and under Augustus it was occupied by a Roman garrison. B. had an oracle held in such high esteem that, in the 2d c. A.D., it was consulted by the Emperor Trajan prior to his entrance on his second Parthian campaign. To test the prescience of the oracle, Trajan sent to it a blank piece of paper, which was returned to him blank. This gave him a high opinion of its powers, and he consulted it in all seriousness a second time. The response was some dead twigs from a vine, wrapped up in cloth. Trajan's decease some two years afterwards, and the transmission of his bones to Rome, was deemed a sufficient interpretation of the symbolical utterance, and confirmed the celebrity of the oracle. Antoninus Pius (138—161 A.D.) built the great temple, which the legend current among the modern inhabitants counts a work of Solomon. This temple is said to have contained a golden statue of Apollo, or of Zeus, which on certain annual festivals the chief citizens of Heliopolis bore about on their shoulders. When Christianity, under Constantine, became the dominant religion, the temple became a Christian church. In the wars that followed the taking of the city by the Arabs, who sacked it in 748 A.D., the temple was turned into a fortress, the battlements of which are yet visible. The city was completely sacked by Timur Bey, or Beg, in 1400 A.D. Both city and temple continued to fall more and more into decay under the misery and misrule to which Syria has been subject ever since. Many of the magnificent pillars were overturned by the pashas of Damascus merely for the sake of the iron with which the stones were bound together. What the Arabs, Tatars, and Turks had spared, was destroyed by a terrible earthquake in 1759. It is now an insignificant village, with a population of some few hundreds. See Wood and Dawkins's *Ruins of Balbec* (Lond. 1757); Cassas, *Voyage Pittoresque de la Syrie* (1799); Murray's *Handbook for Travellers in Syria and Palestine* (1858).

BA'BA, a Turkish word signifying *father*, originating, like our word *papa*, in the first efforts of children to speak. In Persia and Turkey, it is prefixed as a title of honour to the names of ecclesiastics of distinction, especially of such as devote themselves to an ascetic life; it is often affixed in courtesy, also, to the names of other persons, as Ali-Baba.

BA'BA, CAPE, a bold rocky headland near the western extremity of Anatolia—the Lectum of the Greeks—in lat. 39° 20' N., long. 26° 4' E., about 12 miles from the northern extremity of Mitylene, the ancient Lesbos. On a shelving point of the cape stands the town of Baba, with a population of about 4000, who do some trade in cutlery of a superior quality. The once large and prosperous, but now utterly ruined city of Assos, mentioned by St Paul, is in the vicinity.

BABATAG, or BA'BA DAG, a city with 10,000

inhabitants, in the sandjak of Silistria, in the north-eastern part of European Turkey. It is situated in a marshy district; has a high school and five mosques, of which that built by Bajazet I. is the finest. It was Bajazet that founded the city, which he peopled with Tatars, and named after a saint, whose monument, on a hill near by, is resorted to as a place of pilgrimage. Through the port of Kara-Kerman, lying a short way to the south, the inhabitants of B. carry on a considerable commerce with the Black Sea.

BA'BBAGE, CHARLES, born in 1790, entered early at Trinity College, Cambridge, where he took his degree of B.A. in 1814. In 1828, he was elected Professor of Mathematics in his own university, an office which he filled for eleven years. B. united, in the most happy combination, powers of invention and observation with thorough scientific culture. Among his writings, we notice first his extremely correct and well-arranged *Tables of Logarithms* (Lond. 1834). He was the first to make the method of constructing such tables the object of earnest study. The difficulty of securing accuracy in getting up tables on a large scale, led him to the idea of committing the execution of the work to a machine. Being commissioned by the government to superintend the construction of such a machine, before beginning the work, he visited a great many manufactories and machine establishments, both in Britain and on the continent, in order to become acquainted with all the resources of mechanical art, and thus be in a position to make a combined use of them in his great undertaking. This survey afforded him the necessary information for his able work, *On the Economy of Manufactures and Machinery* (Lond. 1832) - a book which has run through several editions, and been translated into several languages—in which all mechanical processes are classified from the most scientific point of view, and the most interesting examples of the more important kinds of manufacture are described. Besides his *Comparative View of the Different Life-assurance Societies*, his *Differential and Integral Calculus*, his *Decline of Science* (1830), *A Ninth Bridgewater Treatise*, and *The Exposition of* 1851 (1851), B. contributed a number of very interesting papers to the Transactions of the Royal Societies of London and Edinburgh.—With regard to B.'s calculating machine, which, from some cause not well explained, was never completed, see CALCULATING MACHINES. He died October 18, 1871.

BA'BEL, TOWER OF. For an account of this building, and the confusion of tongues which it brought about, see the 11th chapter of Genesis. The distinction of being a remnant of the Tower of B. has been claimed for three different masses: 1st, for Nimrud's Tower at Akkerkuf; 2d, the Mujellibe, 950 yards east of the Euphrates, and five miles above the modern town of Hillah; 3d, the Birs Nimrud, to the west of that river, and about six miles to the south-west of Hillah—the whole situated in Babylonia (q. v.). The last of these has the majority of opinions in its favour. Every one, it is said, who has seen the Birs Nimrud, feels at once that, of the ruined mounds in this region, there is not one which so nearly corresponds with his previous notions of the Tower of Babel. According to Mr Rich, it is of an oblong form, the total circumference being 762 yards. At the eastern side it is cloven by a deep furrow, and is not more than 50 or 60 feet high; but on the western side it rises in a conical figure to the elevation of 198 feet; and on its summit is a solid pile of brick 37 feet high by 28 in breadth, diminishing in thickness to the top, which is broken and irregular, and rent by a large fissure extending through a third of its height. It is perforated by small square holes, disposed in rhomboids. The fire-burnt bricks of which it is built have inscriptions on them; and so excellent is the cement, which appears to be lime-mortar, that it is nearly impossible to extract a brick whole. The other parts of the summit of this hill are occupied by immense fragments of brickwork, of no determinate figure, tumbled together, and converted into solid vitrified masses, as if they had undergone the action of the fiercest fire, or had been blown up with gunpowder, the layers of brick being perfectly discernible. These ruins stand on a prodigious mound, the whole of which is itself in ruins, channelled by the weather, and strewed with fragments of black stone, sandstone, and marble. Sir R. K. Porter has shewn that the intense vitrifying heat to which the summit has been evidently subjected, must have been the result of fire operating from above, and was probably produced by lightning. This is a curious circumstance, taken in connection with the ancient tradition that the Tower of B. was rent and overthrown by fire from heaven. Porter thinks that the works of the Babylonish kings, especially the stupendous temple of Belus, which was erected on the site of the old Tower, concealed for a while the marks of the original devastation; and that now the destructions of time and of man have reduced it to nearly the same condition in which it appeared after the confusion.

BAB-EL-MA'NDEB (i.e., 'the Gate of Tears') is the name of the strait between Arabia and the continent of Africa, by which the Red Sea is connected with the Gulf of Aden and the Indian Ocean. The Arabian peninsula here throws out a cape, bearing the same name as the strait, rising to the height of 865 feet. About 20 miles distant from this cape stands the wall-like coast of Adan, rising in Ras Sejan to the height of eet. the straits, but nearer to Arabia, lies island of Perim (q. v.), now occupied by as a fort; the strait on the east side of is called the Little Strait, and that on the Great Strait. The depth of the former 8 to 12 fathoms; that of the latter fathoms. The first is usually chosen by account of its affording good anchorage. the African coast lie eight small islands, c Eight Brothers. The currents in these st generally very strong, and are extremely da for small vessels. The name B. is supposed originated in the frequent disasters occurring strait.

BA'BER, or BA'BUR (Zohir-Eddin Mo the first of the Great Moguls in India, a d of Timur, was born in 1483. He was bar of age when he succeeded his father, C Mirza, in the sovereignty of the co between Samarkand and the Indus. to the conquest of India, although consta tending with revolts in his own dominions, a himself master, by fraud and force, of the p of Kashgar, Kunduz, Kandahar, and Cabul. thus opened the way to India, he made tw rapid incursions into Hindustan; and t advantage of the feeble government Lodi, about the end of 1525, he crossed (the Cabul branch of the Indus), quick some bodies of troops that opposed h Punjab; and at last, in April 15 of Panipat, not far from Delhi, fought a decisive battle with his enemy, was far superior in numbers. The 100,00 1000 elephants of Sultan Ibrahim were d Ibrahim himself fled; and B. made his e

Delhi. In the following month, Agra, the second city of the empire, surrendered. B.'s enjoyment of empire in India was short; he died in 1530, having had to contend during the five years of his reign with numerous conspiracies and revolts. To the talents of a general and statesman, which he manifested in his conquests, his improvements of public roads, measuring of lands, adjustment of taxation, postal arrangements, &c., B. united a taste for science and art. He wrote, in the Tatar language, the history of his own life and conquests, which was translated into Persian by Abdul Rachim, and, more recently, from the Persian into English. B. was succeeded on the throne of Delhi by the eldest of his four sons, Humayun, and was the founder of the B. or Great Mogul dynasty.

BABEUF, FRANÇOIS NOEL, generally known by the name of 'Caius Gracchus,' which he affixed to his political articles, was born in 1764 at St Quentin, in the department of Aisne, France. On the breaking out of the Revolution in 1789, he became a fanatical advocate of the popular demands. During the Reign of Terror he took up a position of hostility to Robespierre and the Terrorists. In his journal, established at Paris in July 1794, and named *The Tribune of the People*, he preached the sovereignty of the masses, and defended the absurdest consequences flowing from that political doctrine. He was in favour of a new distribution of the land, of the abolition of every political order, and the equality of all individuals, wise and foolish. His violent language caused him to be imprisoned. On his release, he attached himself to the members of the extreme Jacobin party, which had just been overthrown. A secret conspiracy was formed, the aim of which was the destruction of the Directory, and the complete re-establishment of the democratic constitution of 1793, which had been suspended during the Reign of Terror. The plot was discovered through the treachery of one of the members. B. and other chiefs were seized, imprisoned, and ultimately brought to trial. B. defended himself with the courage of a fanatic, and overwhelmed his judges with abuse. He was of course condemned to death, and was guillotined on the following day, May 24, 1797. B. was a weak headed enthusiast, without talent or culture; but abler men in the conspiracy made use of his furiously resolute character to secure the ends they had in view.

BABINGTON, ANTONY, an English gentleman of the county of Derby, head of a conspiracy in favour of Mary Stuart of Scotland. The rivalry between Queen Mary and Queen Elizabeth of England was at the same time a contest between Catholicism and Protestantism. Accordingly, the various plots for rescuing Mary from the power of her enemy wore the same character, and have been misrepresented and judged of according to the ecclesiastical prejudices of each historian. B., young, rich, a zealous Catholic, and on that account already an enthusiastic admirer of the unfortunate Mary, was induced, through the agents of a determined conspirator, Morgan, who had been arrested in France at the instance of the English court, to put himself at the head of a plot that had for its object the murder of Queen Elizabeth, and the rescue of Mary. The execution of the murder was undertaken by one Savage, in which he was to be assisted by a number of the Catholic nobility, as circumstances might require. The day of action was fixed for the 24th of August 1586. B. reserved the deliverance of Mary for his own share, entered into correspondence with her, and received letters purporting to be from her in return, approving of the assassination of Elizabeth. The secretary, Walsingham, not only had all the threads of the plot in his hand, but contributed, through his emissaries, to spur on the conspirators to the execution of their plans. When the right moment was come, B. and his accomplices were arrested, and condemned. B. made no denial, acknowledged the letters to Mary to be his, and, September 20, 1586, laid his head on the block. Savage, Barnwell, Bollard, Abington, Tichburne, and Tilnee, had a like fate. Mary Stuart herself had, four months later, to ascend the bloody scaffold; and her condemnation was justified chiefly on the ground of those letters received by Babington. Mary, however, denied to the last moment that the letters were written by her hand, or with her knowledge; and her friends constantly maintained that they were the work of Walsingham himself, in order that the unhappy queen might be got rid of with a show of justice. The rest of Walsingham's conduct in this affair, as well as the way in which he was in the habit of supporting Elizabeth's views in general, give at least a high degree of probability to the accusation.

BABOON (*Cynocephalus*), a genus of the Monkey family, or *Simiadæ* (see MONKEY), and distinguished from all the rest of that family by the very elongated muzzle, which terminates abruptly, and is pierced with nostrils at the end like that of a dog. The face has, indeed, a general resemblance to the face of a dog. The dentition agrees with that of the other ajas or monkeys of the Old World, to which the baboons are entirely confined, being only distinguished by the remarkable strength of the canine teeth. Baboons, like almost all the Monkey family in the Old World, have callosities upon the buttocks; and, like the greater part of them, they have cheek-pouches. The tail of some of the species is of considerable length, that of others is a mere tubercle, with an erect tuft of hairs. The physiognomy of all baboons is repulsive, and indicates the fierceness which strongly characterises them, and in which they differ from monkeys in general; some of the larger ones are dreaded by the inhabitants of the countries in which they are found; the danger to be apprehended from them being increased by the numbers in which they usually herd together. Their fore and hind legs are so proportioned, that they walk easily, and run swiftly on the ground; but, like all other quadrumanous animals, they climb trees and rocks with great agility. Their hair is long, forming a sort of mane on the upper parts. All of them are very susceptible of cold, and they seldom live long when removed from their native tropical countries. They feed chiefly on fruits and roots: some of them inhabit barren and stony places where scorpions abound, which they seize, adroitly deprive of the sting, and devour. They are very cunning, mischievous, and revengeful; troops of them sometimes enter a plantation, not merely to plunder, but apparently to amuse themselves by destroying whatever they can find; they seem, however, always to have some appointed to keep watch, and they make off with great rapidity on the first signal of alarm. When plundering, they cram their cheek-pouches before they begin to eat. These cheek-pouches are very capacious: a B., kept in confinement, has been seen to put eight eggs into them at once, and then to take out the eggs one by one, to break them at the end, and deliberately to suck their contents. The larger baboons are sometimes hunted by dogs where they have not trees to take refuge in; but a single dog, however powerful, cannot safely attack them; a baboon will seize a dog by the hind legs, and whirl him round and round till he is stupified. Baboons are not so easily domesticated as many kinds of monkey; however, they are not quite incapable of it when

taken young. 'Happy Jerry,' a mandrill or rib-nose B., which was long a great object of attraction at Exeter Change, used to sit with great gravity in an arm-chair, awaiting orders, which he obeyed with slowness and composure. He smoked tobacco, but did not seem much to relish it, and was rather induced to do it by a bribe of gin and water, for which his fondness was unquestionable.

As examples of baboons with tails of considerable length, may be mentioned the Chacma, or Pig-faced B., also called the Ursine B. (*C. porcarius*), a native of South Africa; and the Dog-faced B. (*C. Hamadryas*), a native of Arabia, Persia, and the mountains of Abyssinia. The latter species, perhaps the only one known to the ancients, is often sculptured on the ancient monuments of Egypt, and it is supposed to have been the species of monkey to which divine honours were paid. Its body was frequently embalmed, and B. mummies are still found.—The Chacma is one of the largest of the baboons, about the size of an English mastiff, and very much stronger: it is common on the mountains of the Cape Colony, and in troops would be very formidable, but that they usually scamper out of the way, instead of attacking travellers, unless they are provoked. It is of a dark-brown colour, with long shaggy hair. The tail is rather more than half the length of the body, and is terminated by a tuft of long black hair.

The short-tailed, or almost tail-less baboons, far exceed their longer-tailed congeners in ugliness. Only two species are certainly known—the Mandrill or Rib-nose B. (*C. Mormon*), and the Drill (*C. leucophæus*), both natives of Guinea. The mandrill is

Mandrill or Rib-nose Baboon.

the largest, fiercest, and most powerful of the whole genus. The colours of its fur are very fine, of a light olive brown above, and silvery gray beneath; but besides other things unpleasant to the sight, its face is peculiarly hideous; the cheek-bones in the adult males being enormously swollen, so that the cheeks are protuberant to the size of a man's fist upon each side, and ribbed with blue, scarlet, and purple. In their native forests, mandrills generally live in large troops, and are said to put to flight every other wild beast.

BA'BRIUS, a Greek fabulist, who lived about the close of the Alexandrian age, or the beginning of the succeeding Roman-sophistic period, made a considerable collection of Æsopian fables (see Æsop), which he turned into verse, in a natural and popular style. Several versions and transformations of these were made during the middle ages, and have come down to us under the name of *Æsop's Fables*. Bentley, who, in his *Dissertatio de Babrio*, was the first to recognise in these fables of Æsop the original work of B., endeavoured to restore portions of the verses, and pointed out other fra of the genuine B. in other quarters. A were added from manuscripts by Furia, K Schneider, and all that was known at the collected by Knoche (Halle, 1835). At last, a Greek of the name of Minoides Minas, employed by the French government to explore the convents of the East, discovered a manuscript with 123 hitherto unknown fables of B., a copy of which he made and brought to Paris, where they were published in 1844. The best edition is that by Lachmann (Berl. 1845).

BA'BYLON, BABYLO'NIA. Babylonia was the name given in ancient times to the flat country about the lower course of the Euphrates, called in modern times Irak-Arabi. In the Old Testament it is called Shinar, Babel, and also 'land of the Chaldees;' and by the later Greek and Roman writers, occasionally Chaldæa. Its proper boundaries were: on the N., towards Mesopotamia, the Euphrates and the Median Wall, which extended from the junction of the Chabur with the Euphrates to the Tigris; on the E., towards Assyria and Susiana, the Tigris; on the S., the Gulf of Persia; and on the W., the desert of Arabia. During the wider extension of the Babylonian dominion, the name comprehended also Assyria and Mesopotamia. The country forms a perfect plain which is a continuation of that of Assyria. two rivers, Euphrates and Tigris, here appro each other most nearly, until their blended into the Persian Gulf. The country protected from flooding by numerous ca embankments, and several artificial lakes, are now mostly in ruin. The most important was that now known as Nahr-el-Melik, wh undoubtedly the ancient royal canal that the two great rivers. It was kept in repair by Roman emperors, and was serviceable as late a 7th c., till the Mohammedans took poss of country. The soil, naturally fertile, more so by the garden-like way in cultivated, and yielded abundant crops, wheat, barley, and dates. The want o wood was more severely felt than in A only building material was brick, for w afforded abundance of clay. The bricks we dried in the sun or burnt, and were very resisting, in the ruins, the effects of the we this day. Mineral bitumen, springing up every in abundance, served as mortar. In this fa plain, the human race attained early a state of and political organisation, the oldest, indeed, antiquity gives us any account of.

The Babylonians belonged to the A of the Semitic stock, as Sir Henry discoveries among the cuneifo now made clear; and to th their origin. The Mosaic accounts give, founder of the kingdom, Nimrod, the which, from the construction of the whole alogy, seems to point to an immigration the south. Later Greek writers make Baal or Bel the founder. Althou regular astronomical observations, annals extending back to 1903 years under the Great, and long lists of dy Berosus, the national sacred historian the old chroniclers, have been handed whole history of B. is doubtful and an ancient native dynasty of 86 kings, Median dynasties of 8 and 11 kings, wh lowed by a Chaldaic dynasty of 49 kings, Arabian of 9; and lastly, by Queen Semiram much is evident, that the kingdom of As was at first an offshoot from B., gradu

supremacy, and reduced the mother-state to
tion.

the history of B. we find frequent mention
of the Chaldæans. This term is used in
n senses: as denoting the inhabitants of
ea Proper, which formed the southern portion
as synonymous with Babylonians or subjects
ir e re; and, lastly, as the name of a
. With respect to their origin, various
held by modern writers. Some main-
t they may be identified with the Kurds
duchian mountaineers, who are supposed
ve left the mountainous region between
ia and the Euxine, and to have invaded
onquered the plain country. By this theory,
onnection with the Persian Magi is readily
ned. Others, again, as Rawlinson, think
the tide of immigration set in the opposite
ion, and that the Phœnicians and Chaldæans
originally came from Elam or Susiana. A
opinion is, that they were a considerable tribe
ally settled in B., which gradually became the
race.

legends have yet been found among the
orm inscriptions by which we may ascer-
the date of the commencement of the early
an empire, which preceded the Assyrian, but
bly the traditional date (2234 B. C.) is historic.
perfect list of 26 kings has been deciphered
various legends; but as the interval to fill up
re than seven centuries, we must wait for
r discoveries before a successful attempt can
de at arranging the chronology of this remote
L. Bricks have been found bearing the inscrip-
f *Kedur-mapula*, who is conjectured to be the
-laomer of Scripture, and to have lived in
arly part of the 20th c. B. C. This king's
ition seems to have been one of the migratory
ments, in which, as stated above, the Phœnicians
Chaldæans bore a part, for the distance from
to Syria is too great to allow us to believe that
ncursion was merely for the sake of plunder.
ese ancient Chaldæan legends Assyria is not
mentioned; and the only notice we have that
ia was subject to B., is found on the cylinder
glath-pileser I., where it is recorded that an
ian temple had been originally built by a son
si-dagon, the fifth king of the early Chaldæan
ty, whose date is about 1861 B. C.

the close of the Chaldæan period (1273 B. C.), the
- was transferred from the mother country to
noot Assyria; and from this date till 747, the
on of the former state is very subordinate.
history of the period between 747 and 625 is
y points uncertain. One point, however,
en clearly ascertained from the inscriptions
B. was by no means a submissive vassal, but
on one occasion at least, a Babylonian monarch
ed Assyria, defeated the opposing forces, and
ed the capital. The name of *Mer-i-k-Bildadan*
s both in Scripture and in the Assyrian inscrip-

From the former, we know that this king sent
ssage to Hezekiah, king of Judah, ostensibly to
re about his recovery, probably with a view to
liance against Assyria; and from the latter, that
dach was expelled by Sargon, king of Assyria,
he made a fresh attempt to recover his throne,
was finally dethroned by Sennacherib. An
ption of this last-named monarch, which de-
s the punishment inflicted on the revolted pro-
, also records that he had recovered certain gods
had been taken from Nineveh 418 years before
Babylonian monarch. The complete subjection
to Assyria at this time (680 B. C.) is proved
from the Scripture account, which states that
addon, son of Sennacherib, reigned in Babylon.

About fifty years afterwards, Nabopolassar, governor
of B. for the Assyrian king, proved faithless to his
trust, and entered into an alliance with the Median
king, Cyaxares, for the overthrow of the ruling state.
See ASSYRIA. This undertaking was successful, and
B. now (625 B. C.) became, though it was but for a
short time, an independent and conquering power.
The son of Nabopolassar, Nebuchadnezzar II. (or,
as he is called in the Persian cuneiform inscriptions,
Nabuchudratshara), next defeated the Egyptian
king, Necho, at Circesium (Karchemish), on the
Euphrates (604 B. C.), and thus annihilated the
Egyptian dominion in Asia. He then subdued
Jehoiakim, king of Judah; and in consequence of
repeated revolts, destroyed Jerusalem, and put an
end to the kingdom of Judah under Zedekiah (588
B. C.), carrying the inhabitants captive to Babylon.
The Phœnicians submitted to him voluntarily, with
the exception of Tyre, which underwent an obstinate
siege without yielding. After a fortunate expedition
against Egypt, Nebuchadnezzar turned his attention
to the adornment of his capital; and we may believe
that a considerable part of those buildings, usually
ascribed to a very early period, and especially to
Semiramis, belong to him. The great embankment
at Bagdad, usually ascribed to the califs, has been
proved by Rawlinson to date from this monarch.
After his death (562 B. C.), the Neo-Babylonian empire
fell to pieces as suddenly as it had sprung up, and
under Nabonidus (Nabunita, in the cuneiform
inscriptions, and in Herodotus, Labynetos), who had
entered into an alliance with Cresus of Lydia,
against Persia, it came under the dominion of Cyrus
(539 B. C.). The Belshazzar of Scripture is thought
to be the son of Labynetos, to whom was confided
the defence of B., while the elder prince held
Borsippa. After the fall of B., Labynetos submitted
to Cyrus, and was treated with kindness. As a
Persian province, however, B. made many attempts
to assert its freedom. Thus, in the great inscription
of Behistun (q. v.), Darius I. relates, that after his
accession to the throne at B., a certain Nidintabira
gave himself out for Nabuchudratshara, the son of
Nabunita, and gained over the whole people; that
he (Darius) had defeated him in battle, but that it
had been necessary to besiege the rebellious city, in
the course of which siege the rebel had met his
death. From this time B. appears on the Persian
monuments as a Persian satrapy, under the name of
Babirus.

With the overthrow of the Persian monarchy,
B. came under the short-lived dominion of Alex-
ander the Great, who died in that city (323 B. C.).
Seleucus I., to whom it had been promised at the
conference of Triparadisus, contested and won the
possession of it from Antigonus (312 B. C.). About
140 B. C., it was taken from the Syrian monarchs by
the Parthians. It came into the hands of the
Romans only temporarily, first under Trajan (114
A. D.), under Septimius Severus (199 A. D.), and again,
under Julian (363 A. D.). When, in 650, the suc-
cessors of Mohammed put an end to the new
Persian monarchy of the Sassanides, the province of
B., where Bagdad was built (762–766), became the
seat of the califs till 1258. Since 1638, when the
Turks, for the second time, took it from the Persians,
it has been under the dominion of Turkey, divided
into the pachalics of Bagdad and Basra.

The civilisation of the ancient Babylonians was
of a rather high stamp, much like that of the
Assyrians. The government was despotic, of a
kind to suit a crowded, luxurious, and effeminate
population. In the accounts of Herodotus, we see
traces of administration by satraps. Justice is said
to have been dispensed by three great courts of
law. Arts and commerce were highly flourishing;

the last was carried on by caravans with Bactria, Persia, and Media, perhaps as far as India, and by shipping on the Persian Gulf with Arabia. The commerce has indeed remained much in the same position down to the most recent times. In the 16th c., the English carried on traffic with this country; in modern times, Bagdad holds the place of the ancient B. and Ctesiphon. B. was famous for its dyes, its cloths, and embroideries, especially for the manufacture of rich carpets with inwoven figures of strange animals and arabesques, such as we yet see on the Nineveh sculptures. Commerce gave rise to the invention of measures and weights; and the general prosperity was such, that B. and Assyria together were able to pay to Persia, in the time of Darius Hystaspes, a yearly tribute of 1000 talents (upwards of £280,000)—a sum considerably greater than that contributed by any other province. This, however, reveals also the national character of the Babylonians, who were notorious for their effeminacy, luxury, and licentiousness. Their religion was nearly allied to that of the Phœnicians. The essential part of it was the worship of the powers of nature, as they are manifested in the larger heavenly bodies and in the fertility of the earth. At the head of their system of belief stood Baal (see BAAL), reverenced through the whole of Mesopotamia and Canaan, who represented, in a general way, the power of nature, without having any moral significance, and was specially identified with the sun. Along with him stood, as feminine complement, the goddess Baaltis, the receptive Earth, with whose worship all manner of licentious rites were associated. She makes her appearance principally as Melyta or Mylitta—i. e., 'the causer of generation.' How nearly she is related to Ashtaroth (among the Greeks, Astarte), whose functions are so similar, it is not easy to determine. Education and religion were in the hands of the caste of the Chaldees, which was not, however, hereditary, but was drawn from the body of the people, since even the foreign prophet Daniel was taken into the number. They occupied themselves at the same time with astronomy and astrology, and kept records, from the earliest times, of their astronomical observations, associating with them the chronicles of their kings. All this they did in a strictly collegiate capacity, for we always find the collective name, 'the Chaldees,' and never the name of an individual. Their scientific acquirements must have been considerable. See Ideler *On the Astronomy of the Chaldæans* (in the Transactions of the Berlin Academy, Historico-philological class, 1814—1815). Beyond engraved cylinders and stones, we have no considerable monuments of the state of the representative arts among them, and cannot, therefore, satisfactorily judge of it. Their architecture, on the contrary, according to the testimony of the ancients, and the ruins still remaining, deserves to be ranked high.

Apart from canals, bridges, embankments, and sluices, the interest on the subject of Babylonian architecture is concentrated in the ruins of the capital, BABYLON. The accounts that we find in the ancients of the origin, the greatness, and the structure of the city, are exceedingly confused. The god Belus is named as its founder, and also Queen Semiramis; how we are to understand the two statements is not explained. Semiramis, according to the account of Diodorus, employed on it two millions of workmen, collected from all parts of her dominions. With the capital of the older kingdom, the accounts of the ancients known to us have, for the most part, nothing to do; they are all to be referred to the resuscitated and adorned residence of Nebuchadnezzar. Herodotus gives a description of the city, apparently from his own observation. It stood on both sides of the river, in the form of a square, the length of whose sides is variously given; by Herodotus it is stated at 120 stadia, making the whole circumference 60 miles. It must be remembered, however, that the walls, like those of most oriental towns, enclosed rather populous districts than cities, so that the whole mass of the population might easily find shelter within the space enclosed. It was surrounded by a wall 200 cubits high, and 50 cubits thick, and furnished with 100 brazen gates—the last number is raised by Diodorus to 250. The city was built with extreme regularity, with broad straight streets crossing one another at right angles; and the two parts were connected by a roofed bridge built of hewn stones, fastened together with iron clamps. Of this bridge, not a trace has yet been discovered. The western part of the city is undoubtedly the older, belonging to the early and properly Babylonish dynasty. Here stood, in the middle of the city, as it is described, the famous temple of Belus or Baal, called by the Arabs, Birs Nimrud. See BABEL, TOWER OF. The next important point on the west side is the mass of ruins called Mujellibe, which was probably the royal citadel of the old Babylonian monarchy. On the east side of the river stood the buildings of the Neo-Babylonian period, among which the 'Hanging Gardens' of Semiramis are to be singled out as one of the wonders of the world. Of these gardens, Diodorus has left us a detailed description. Their ruins may be recognised in the mound called El-Kasr. The city suffered greatly from the Persian conquest. When it revolted under Darius I., and, after a siege of two years, was recaptured through the ingenuity of Zopyrus, the outer walls were demolished. Xerxes plundered the temple of Belus, which had been hitherto spared, and Herodotus found it empty. Although the Persian kings made B. their residence, nothing was done for the restoration of the city; and Alexander the Great, who, on his entrance, in 331 B.C., had promised the inhabitants to rebuild the ruined temple, was unable even to clear away the rubbish, although he employed 10,000 workmen for two months. After his death in the palace of Nebuchadnezzar, and the foundation of Seleucia on the Tigris by Seleucus Nicator, B. went rapidly to decay. This was partly owing to the new city's being built of the materials of the old, and partly to the want of durable materials for monumental buildings. Stones of any size had to be brought from the mountains of Armenia; their place was mostly supplied by burned brick. As early as the time of Pausanias, there was little to be seen but the ruins of the walls. The older Arabian geographers know, indeed, of a village, Bâbil, but speak more of the great masses of ruins. Since the time of Della Valle, who erroneously looked upon the ruin Mujellibe as the tower of Belus (in which he is followed by Rennel), the site of B. has been the object of many travels and researches. The greater number of the explorers, among whom Rich is the most distinguished, consider the town of Hillah, with 7000 inhabitants, as the representative of the ancient Babylon. The great masses of ruins, from which we must not, with Rennel, exclude the Birs Nimrûd, embrace, indeed, an enormous extent, but agree perfectly with the accounts of the ancients in being arranged in the form of a square. Some time ago, Rawlinson transferred the site of B. to Niffer; but before anything can be determined, researches must be made on the spot, which could hardly fail to lead

e same time to valuable results, like those otta and Layard in Assyria, and increase ollection of cuneiform inscriptions, which are aly fragmentary. See Rich's *Memoirs on the of Babylon* (3d ed., Lond. 1818), and his *nal Narrative of a Journey to England by rah, Bagdad, the Ruins of Babylon* (Lond. : man's *Travels in Chaldæa* (Lond. 1829); *Travels in Koordistan, Mesopotamia* (Lond. ; Wellsted's *Travels to the City of the* (Lond. 1840); Vaux's *Nineveh and Persepolis* . 1850); Rawlinson's *Herodotus* (Lond. 1858).

BYLONISH CAPTIVITY. In the despotic of the East in ancient times, it was a rule to e the rich and leading inhabitants of a con- l province to a distant part of the empire, they were separated by nationality, language, s, and religion from the great body of the tion, and thus rendered politically harmless; the people that remained behind were by this deprived of influential leaders. The inhabit- f Judea underwent oftener than once a depor- of this kind, after they came into conflict he powerful kingdom of Assyria. Thus, the m of Israel was put an end to under King (722 B.C.), by the Assyrian monarch Salmanas- . after taking the capital, Samaria, carried ipal inhabitants into captivity in Assyria, ught stranger tribes into the land of Israel in ; these, with the Israelites that remained, erwards the mixed nation of the Samari- The most remarkable exile, however, befell of Judah under Nebuchadnezzar. Zedekiah, Judah, warned in vain by the prophet Jere- allied himself with the king of Egypt against vereiguty of Babylon. Nebuchadnezzar soon ed with a powerful army before Jerusalem, he took (588 B.C.). King Zedekiah had his eyes t, and he and the principal part of the inha- were carried captive to Babylon. It is this ity, the duration of which is usually reckoned vears, although, strictly speaking, it lasted years, that is called, by way of distinction, abylonish Captivity.' The situation of the was in other respects tolerable. Most of them down, and acquired property, and even riches; were called to court, and even raised to high in the state. They were allowed to retain rganisation by families, and lived by them- essentially according to the Mosaic law. had also their own chief, and were allowed e exercise of their religion. Nor did they consolation and encouragement; for Ezekiel among them his powerful prophetic voice, idea of the Messiah became more clearly ped. When Cyrus overthrew the Babylonian (538 B.C.), he allowed the Jews to return ir own country. Only the tribes of Judah, min, and Levi, availed themselves of this sion, the other ten tribes disappear from after the Captivity. It is probable that ad become so mingled with the Babylonians, le of kindred origin, that they had ceased to er the country of their race. Vain attempts recent times, been made to discover the ten es. Some learned men have sought for China and India, while others have declared as to be their descendants, and even the merican Indians. A more probable con- , perhaps, is, that they were the ancestors Nestorians in the mountains of Kurdistan.

BYROU'SSA (*Sus Babyroussa*), a species of q. v.) inhabiting the forests of Java and lucca Islands, remarkable for the extraordi- sks of the upper jaw, which rise like horns through the bone and integuments, are long, somewhat slender, and curved backwards; their use being

Babyroussa (*Babirussa alfurus*).

probably similar to that of horns. The animal is sometimes called the Horned Hog. Its limbs are much more slender than those of the common hog.

BACCHIGLIONE, a river of Northern Italy, having its source in the Alps, and its outlet in the Adriatic. It passes through the town of Vicenza, where it is crossed by a fine bridge of nine arches; flows through the plain of Padua, and enters the Adriatic about 3 miles south of Chioggia. Its whole course is about 90 miles, and it is navigable by large boats from Vicenza to the sea.

BACCHUS, the god of wine (called in Greek Bakchos, Dionysos, and also, especially in the Mysteries, Iakchos), was the son of Zeus and Semele, the daughter of Cadmus. Before his birth, Semele fell a victim to the insidious counsels of the jealous Here, who induced her to petition Zeus to visit her in his proper form and majesty—i. e., attended with thunder and lightning. The mother was of course consumed, but the six-months-old B. was saved by being enclosed for some time in the thigh of Zeus. He was first consigned to the care of Ino, the sister of Semele, and her husband Athamas; but when Ino and Athamas were driven mad by Here, Zeus caused him to be carried to Nysa, in Thrace, and given in charge to the Nymphs. It

Bacchus.

was here that B. taught the cultivation of the vine, and prepared intoxicating drink from the grapes. In order to impart his discovery to mankind, or, as some say, because Here smote him with madness, he wandered through many countries attended by the Nymphs, who were crowned with ivy and vine-leaves, and bore in their hands the *thyrsus*, a pole bound round with leaves and fruit. This expedition, according to a later form of the myth, extended to Bactria and Media, to Egypt and India, where B. is said to have erected pillars as the eastern boundary of the world. Wherever he came in his wide progress, there is a Nysa to be found. The worship of the god, which

came originally from the East, and was introduced into Greece by Melampus, was thus spread over nearly the whole of the then known earth, and at the same time the myth of B. was variously modified among the different peoples, so that it has become one of the most perplexed and difficult. B. was, besides, the protector of fruit-trees, and of fruits in general. His worship being thus extensively spread, and his festivals being held with music and song, he naturally received a great many surnames; for example, he was called Lenæos, from the wine-vat (*lenos*); Bromius, from shouting (*bromos*); Euios (in Latin, Evius), from the exclamation *Euoi*, &c. The mythical march or expedition above spoken of, was suggested to the fancy by the Bacchanalian festivals, at which Bacchantes roved about in feigned madness, and made midnight processions to the mountains by torch-light. B. met with much opposition on his expeditions, many refusing to acknowledge his divinity. Thus, Lycurgus, king of the Edones, opposed him, and also Pentheus of Thebes, who was on that account torn to pieces by his own mother and her sisters. The daughters of Mynias (q. v.), who refused to celebrate his festivals, were punished by him with madness and metamorphosis. As he was crossing to Naxos, the Tyrrhenian sailors wished to carry him off to Italy, and, with this view, bound him; but the chains fell off, vines and ivy entwined the ship, and held it fast in the middle of the sea. B. changed himself into a lion, and the sailors from terror leaped into the sea, where they were transformed into dolphins. Those, on the contrary, who received him with hospitality and reverence, were rewarded; such as Midas (q. v). In general, the character of B. is mild. In works of art, his type is that of a youth inclining to effeminacy. His peculiar ornament is the fillet. The long blond hair is bound up in a knot behind, and only a few locks fall down on both sides over the shoulders; the hair is surrounded by a twig of vine or of ivy. His figure is neither stout nor slim. He is usually represented quite naked; sometimes with a wide robe negligently thrown over, which either covers a part of the shoulders and thighs, or, though more rarely, enwraps the greater part of the body. Frequently, a deer-skin hangs across the breast; at times, he wears shoes, more rarely, buskins. From this, the properly Grecian B., the bearded or Indian B. is completely distinct. This last appears in a more dignified, lofty, regal form; he is clad in a tunic reaching to the feet, over which he wears a wide and splendid mantle. As a warrior, he wears a short tunic girded round the waist, with buskins on the feet; a panther's skin serves him for a shield. In addition, he is to be seen at times with horns. After the institution of the Eleusinian Mysteries, the service of B. was conjoined with these; accordingly, Pindar makes him the companion of Demeter. As the followers of Orpheus held him to be also Apollo, he is associated with the Delphic oracle.

The worship of B. consisted in noisy rites. Thebes, in Bœotia, held to be the birthplace of the god, was considered the chief seat of those rites in Greece. In Athens, the worship of the Lenæan B. was the most ancient, and may be traced back to ante-historic times. The chief offerings made to him were goats and oxen; the last, because he himself was conceived and represented under the form of an ox. The Bacchic festivals deserving special notice are — 1. The Attic Dionysia, of which the minor, or country Dionysia, were celebrated in the country in the month Poseideon, at the time of the grape-gathering. Among the characteristic amusements of the occasion were the Askolia, which consisted in smearing full wine-skins (*askoi*) with oil, on which the young peasants attempted to leap with one foot, and by their frequent falls produced merriment. were also dramatic entertainments. This was probably held at the approach of harvest, and that of the Halœa at its close were followed, in the month Gamelion, festival of the Lenæa, which was peculiar city of Athens. The festivities on the besides theatrical representations, consisted banquet, for which the state provided the in a procession through the city, attended jesting and raillery usual at Bacchic After the Lenæa came the Anthesteria 12th, and 13th of the month Anthester new wine was first drunk. On the this festival, the chief solemnity consisted in public dinner, at which the guests, crown flowers, and to the music of trumpets, ente regular contests in drinking, and in a priva fice for the prosperity of the state offered 'king archon's' wife, who was at the symbolically married to the god. On a sacrifice was offered to the Chthonian to the souls of the dead. Last c Dionysia, which were celebrated Elaphebolion, and at which new c tragedies were represented. 2. The nysia, which were celebrated every third the middle of winter. The performers were and girls (called in Greek, *Manades;* in *Bacchæ* or *Bacchantes*), and the orgies were night, on the mountains, with blazing torc the wildest enthusiasm. This mystic s from Thrace, and its institution is Orpheus. When it was adopted in Greece be exactly determined. It is earliest met Bœotia, particularly at Thebes, where the was the scene of celebration. An importan connection with it is also Parnassus, on the summit of which the women of Attica and celebrated nocturnal orgies in honour of Apollo. The Mænades or Bacchantes were cla

Bacchant.

occasion in fawn-skins, swung about made a great noise with clapping of hand wildly with streaming hair. In nity, the god himself was repre sacred to him, the ox, which fury tore in pieces. In the m human sacrifices were not unc of these wild and terrible rites in the poets. 3. The Bacchanalia foundation of which was laid in

panesian war, by the introduction of foreign
From Greece they were carried to Italy. As
as 496 B.C., the Greek worship of B. was
ieed at Rome along with that of Ceres;
'eres, Liber, and Libera were worshipped in a
on temple. In honour of these deities, the
alia were celebrated on the 17th of March, and
of a yet simpler and ruder kind than the great
sia of Athens. Afterwards, however, these
legenerated, and came to be celebrated with a
ousness that threatened the destruction of
ity and of society itself. They were made the
on of the most unnatural excesses. At first,
women took part in these mysterious Bacchic
but latterly men also were admitted. When
vil had reached its greatest height, the
ament (186 B.C.) instituted an inquiry into it,
votsel out the Bacchanalia with the greatest
ty. This was the occasion of the well-known
is *Consultum de Bacchanalibus*. Mention of
however, still occurs at a later period under
iperors.—Wild, excessive revels are still called
analia.

CCIO DELLA PORTA, better known by
ame of Fra Bartolomeo di San Marco, one of
ost distinguished masters of the Florentine
of painting, was born at Savignano, in
ny, in 1469. His first teacher was Cosimo
i; but he owed his higher cultivation to the
of the works of Leonardo da Vinci. His
ts are mostly religious, and by far the greater
of his pieces belong to the later years of
e. He was a warm adherent of that bold
er of church and state, Savonarola (q.v.),
whose tragical end he, 1590, took the habit of
nister, and for a considerable time renounced
The visit of the young Raphael to Florence
M seems to have been instrumental in stimu-
him to return to it. He imparted to Raphael
owledge of colouring, and acquired from him
e perfect knowledge of perspective. The two

ng certain of Raphael's unfinished works,
uel performing a like kindness for him at
er time. B. died at Florence, 1517. The
r number of his works are to be seen at
ence, in the gallery of the Pitti Palace.

CH, BARON ALEXANDER, an Austrian statesman, was born January 4, 1813, at Lemberg, in Lower
ia, where his father held a post under the
Prussian Government. At the age of
was presented to the Faculty of Doctor of Laws,
hen entered the imperial service, in which he
ned about nine years. During this period also
avelled over the greater part of Europe and
of the countries of Asia. He was on terms of
ship with the members of the opposition of
Austria, and belonged to that circle of young
who well understood the failings of the old
n, and the inevitability of a change in the
sation of Austria. He took an active part in
ing the Juridico-political Reading Club, and
gously defended it against the police. On the
nce of the events of March 1848, B. took
nguished place as a mediator. He formed part
Provisional Committee of the Commons, and
also chosen in April, by the state of Lower
ia, one of their representatives in the Central
mission of the Provincial States of Austria.
this, the outset of his political career, B.
y showed a leaning to those views which he
ards manifested as minister. He advocated
ntralisation of the Austrian monarchy, and
ed himself against the intelligence of Hun-
as well as against the entry of the German
provinces of Austria into the German confederation. But he also desired an extension of the basis of the states, and of their parliamentary influence in the direction of public affairs. During the occurrences of the 15th of May 1848, B. kept away from Vienna. When, after these occurrences, the old liberal opposition came to the helm, B. undertook the ministry of justice. He now entered with talent and energy into the remodelling of the whole system of Austrian law. On the other hand, the part he took in the assembly brought upon him the hatred of the 'left,' and of the democratic party generally. The opposition was particularly bitter on the question of removing the burdens from peasant proprietors, on which B. maintained the principle of compensation, and wished a part of that compensation to be made good by those who had hitherto borne the burdens in question. His policy, also, with regard to Hungarian affairs met with violent opposition from the 'left.' In the events of the 6th of October 1848, B. would have fallen a victim to popular fury, like the war-minister Latour, had he not found an opportunity of withdrawing from pursuit. On the formation of the Schwartzenberg-Stadion ministry, he again took the portfolio of justice, and participated in the measures regarding Hungary and all the other important steps taken by that ministry. On the withdrawal of Stadion in May 1849, B. took his place at the head of the ministry of the interior, from which he was sent, in 1859, as plenipotentiary to Rome a mission which terminated in 1855. Among his most important labours as minister of the interior are the constitutions for the different crown lands, as well as the organisation of their political administration.

BACH, JOHANN SEBASTIAN, a celebrated musician, born at Eisenach, Upper Saxony, in March 1685. When he was ten years old, his father, who was a musician at Eisenach, died, and B. sought the protection of an elder brother, who, dying soon after, he was again left destitute, and, to earn a livelihood, entered the choir of St Michael's, Lunéburg, as a soprano singer. In 1703 he became court musician at Weimar, and, the following year, organist to a new church at Arnstadt. His reputation in this capacity soon spread, and in 1708 he was appointed court organist at Weimar, by the reigning duke. While holding this office, he laboured assiduously to make himself master of every branch of music. In 1717, he was made director of concerts, and six years afterwards, director of music, and cantor to St Thomas's School, Leipsic, an appointment which he held to his death. About ten years later, the honorary distinctions of Kapellmeister to the Duke of Weissenfels, and court composer to the king of Poland, were conferred upon him. B., who had a son in the service of Frederick the Great, received a pressing request to visit Potsdam on the occasion of a concert there. He went, and acquitted himself greatly to the satisfaction of that monarch, some of whose music he played at first sight. B.'s close studies affected his eyes, and an operation designed to benefit them, left him totally blind, and hastened his death, which took place in July 1750. With the exception of Handel, B. had no rival as an organist; and his compositions for the organ have a deservedly high reputation. They are too elaborate, however, ever to become very popular, though his fame as a composer is sure to advance with the progress of scientific musical culture. The highly educated musician will best appreciate the grandeur of some of his works. In 1850, a Bach Society for the study and practice of his compositions was formed in London, and since that time some of them have been publicly performed in this country. Three of his sons were also musicians of some note. One of

them, Johann Christian, held the appointment of music-preceptor to Queen Charlotte.

BA'CHARACH, a small town of Rhenish Prussia, romantically situated on the left bank of the Rhine, 22½ miles above Coblenz. It has a population of 1900, with a brisk trade, and a good deal of commerce by river-craft. It is said to have derived its name from Bacchus (*Bacchi ara*), and the vine is still largely cultivated in the neighbourhood—the wine produced being of a superior quality. B. is noteworthy also as the place where Blucher crossed the Rhine, on January 1, 1814.

BA'CHELOR (Fr. *bachelier*, Lat. *baccalaureus*, or, as it is variously written in old documents, *baccalareus*, *bacularius*, and *bacillarius*). This word, which first makes its appearance in middle-age Latin, is of very uncertain etymology, and its primary meaning is consequently involved in obscurity. The usual derivation, from *bacca laurea*, a laurel berry, gives us little help; but the Spanish *bachillir*, which means at once *a babbler* and a master of arts, taken in conjunction with the Portuguese *bacharel* and *bacillo*, a shoot or twig of the vine (from the Latin *baculus* or *baculum*, a stick or shoot), and the French *bachelette*, a damsel, seem to point to its original and generic meaning, which probably was *a person shooting, or protruding from one stage of his career into another more advanced.* With this general signification, all the special meanings of the word given by Ducange seem to have some analogy. 1. It was used, he says, to indicate a person who cultivated certain portions of church-lands called *baccalaria*—which he supposes to have been a corruption of *vassaleria*—a feu belonging to an inferior vassal, or to one who had not attained to a full feudal recognition. 2. It indicated ecclesiastics of a lower dignity than the other members of a religious brotherhood—i. e., monks who were still in the first stages of monkhood. 3. It was used by later writers to indicate persons in the first or probationary stage of knighthood; i. e., not esquires simply, but knights who, from poverty and the insufficient number of their retainers—from their possessing, perhaps, only the *baccalaria* above referred to—or, from nonage, had not yet raised their banner in the field (*levé bannière*). 4. It was adopted to indicate the first grade or step in the career of university life. As an academical title, it was first introduced by Pope Gregory IX. in the 13th c., into the university of Paris, to denote a candidate who had undergone his first academical trials, and was authorised to give lectures, but was not yet admitted to the rank of an independent master or doctor. At a later period, it was introduced into the other faculties as the lowest academical honour, and adopted by the other universities of Europe. See DEGREES, UNIVERSITY. 5. It came to be used in its popular meaning of an unmarried man, who was thus regarded as a candidate or probationer for matrimony.

The legislation of almost every country, at some period of its history, has imposed penalties on male celibates or bachelors, on the principle that every citizen is bound to rear up legitimate children to the state. By the Jews, the command, 'Be fruitful and multiply,' was interpreted strictly, and every Hebrew regarded marriage as a duty. In Sparta, where the interests of the individual were entirely sunk in those of the state, criminal proceedings were authorised by the laws of Lycurgus not only against those who neglected to marry, but against those who, from marrying late in life, or any other cause, formed such alliances as rendered the procreation of healthy children unlikely. By the laws of Solon, celibacy was also treated as a crime, though the practice of interfering with the feelings of the individual in this respect early fell into desuetude at Athens. At Rome, penalties and disabilities were imposed on unmarried men from an early period, and latterly on unmarried women also. In the allotment of the Campanus lands, Julius Cæsar gave portions only to those who had three or more children; and in later times we have the *jus trium* (*quatuor et quinque*) *liberorum*. The most important provisions on this subject are contained in the law (or rather the laws, for it consisted of an act and an amended act) called Lex Julia et Papia Poppæa, the first portion of which belongs probably to 18 B.C., and the second portion to 9 A.D. In addition to various other provisions regarding marriage, this law imposed penalties on those who lived in a state of celibacy after a certain age. No unmarried person could take a legacy, whether of a portion or of the whole possessions of a deceased person, unless he complied with the law—i. e., got married within a hundred days from the testator's death. Widows were at first allowed a year from their husbands' death, and divorced women six months from the time of the divorce, before they came within the penalties of the law; and these periods were afterwards extended to two years, and a year and six months, respectively. The original provisions of the law did not apply to men beyond sixty, or women above fifty, but they were extended to them by subsequent enactments, and made perpetual even in case of their marrying. The *Senatûs consultum* passed in the time of Claudius, however, again exempted men above sixty who married wives under fifty, as from their unions it was supposed there was a fair prospect of issue. Childless married persons, moreover, from the ages of twenty-five to sixty in males, and twenty to fifty in females, were subject to the penalties of the *lex*, to the extent of losing one-half of any inheritance or legacy which might be bequeathed to them. The Lex Papia also contained a provision by which a candidate who had several children was preferred to one who had fewer; and various other premiums on fruitfulness were held out both at Rome and in the provinces.

In Britain, there are numerous instances of additional or higher taxes being imposed on bachelors and widowers, but apparently more with a view to the revenue than with any other object. Of this, 6 and 7 Will. III. c. 6, which was passed in 1695, and which granted to his majesty certain rates and duties upon marriages, births, and burials, and upon bachelors and widowers for five years, 'for carrying on the war against France with vigour,' is an instance; and another, probably, may be found in the higher charge for the servants of bachelors, first imposed by Mr Pitt in 1785, and continued for a considerable time. By 52 Geo. III. c. 93, unmarried daughters of persons alive were exempted from the tax upon hair-powder; and in the income-tax of 1798, deductions were made on account of children, 5 per cent. being allowed to a person who had a family, and whose income was above £60, and under £400 a year, corresponding deductions being made in other cases. Much might be said in favour of such distinctions, on the ground of expediency, as they enable the government to impose a higher taxation, by lessening the burden on those members of the community who are most likely to complain; but their recognition in practice would, no doubt, be regarded as impossible by the financiers of our day, who have hitherto failed to distinguish between income derived from realised property and from personal labour.

BA'CHELOR, KNIGHT (qu. *bas chevalier*), the lowest grade of knighthood, now only conferred in the United Kingdom. Originally, like all knight-

ary distinction, knighthood of this
to be often bestowed on civilians,
mes it has frequently been conferred
r service than carrying a congratu-
to court. It is generally conferred
gn by a verbal declaration accom-
a due imposition of the sword, and without
or instrument. The person who is to
honour kneels down before the sover-
ouches him on the shoulder with a naked
ing, in French: '*Sois chevalier au nom*
Be a knight in God's name), and then
e, Sir A. B.' In exceptional cases, persons
made Knights Bachelor by patent. The
ant of Ireland occasionally exercises a
ferring knighthood. See KNIGHT.

SIR GEORGE, a well-known traveller in regions, was born at Stockport in 1796. early on a naval career, and accompa- lin and Richardson in their expedition h coast of America. He volunteered to ment to go in search of Captain Ross, apposed to have been lost in his attempt the North-west Passage; and his offer n accepted, he left London, February 17, on the 28th of June, started from se, a station of the Hudson Bay Com- is journey to the north. After passing winter with his companions at Slave iscovered, in 1834, Artillery Lake, and Fish River, or Back's River, which he o the Frozen Ocean. Being hindered from proceeding along the coast as far rn-again, he returned by the river; but e had received news of the return of ess, he continued his explorations in Sea, and did not return to England , when he was raised to the rank of post-captain for his services. In 1836 and 1837, he further explored the arctic shores in the interests of geography—the Geographical Society, in the latter year, bestowing its gold medal upon him. Two years afterwards, he was knighted, and he has since had a lucrative Treasury appointment. He attained flag rank in 1857, and that of admiral in 1867.

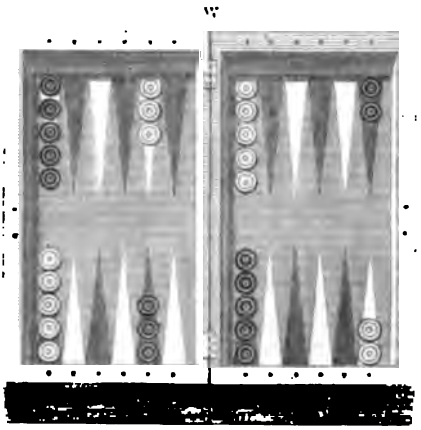
BACKERGU'NGE, a town of Bengal, situated on Backergunge Creek, an offset from the Ganges, in lat. 22° 33' N., and long. 90° 22' E.—125 miles to the east of Calcutta. Till supplanted by Burrisol, which is 12 miles to the north, it was the capital of the district of the same name.

BACKERGU'NGE, the district named from the foregoing town. It extends in N. lat. from 22° 2' to 23° 13', and in E. long. from 89° 49' to 91°, containing 5000 square miles, and 2,377,000 inhabitants, or about 480 inhabitants to a square mile. Like the rest of the great delta of Bengal, B. is of alluvial formation and level surface, being watered at once by the lower streams of the Ganges and the Brahmaputra, and also by the various branches or offsets which interlace together those mighty rivers. In consequence of the great number of water-courses, which at once cool the atmosphere and drain the soil, the country is fertile, and the temperature is said never to rise above 88° in the shade. From the same cause, the district is independent of regular roads for intercourse and communication. In the season of high-water, as may be expected, inundations are common. To guard against them, the houses are built on mounds; while the corresponding excavations, like the natural 'water-holes' of Australia, serve as tanks against the effects of the dry season. As is often the case in alluvial regions, land-slips are frequent, and also the opening of new channels for the streams. The productions are rice, sugar, cotton, pulse, mustard, cocoa nut, betel-nut, mango, guava, plantains, limes, pine-apples, ginger, and turmeric. Buffaloes are said to be generally used instead of oxen, of which the domestic breed is small and poor.

BACKGA'MMON is the modern name of a game of considerable antiquity in England, where it was formerly known by the appellation of 'the tables.' The words *back-gammon* have been ascribed to the Welsh tongue, in which they are said to signify *little battle*; but Strutt, with greater plausibility, traces the term to the Saxon '*bac* and *gamen*—that is, back game—so denominated because the performance consists in the two players bringing their men back from their antagonist's tables into their own; or because the pieces are sometimes taken up and obliged to go back—that is, re-enter at the table they came from.' Whatever be the etymology of the term, the game has been long established in the country; and as a fireside amusement of a decorous nature, is a favourite among clergymen, squires, farmers, and retired professional persons.

B. is played with an apparatus consisting of a board or tables, men or pieces, dice, and dice-boxes. The introduction of dice into the game, and their constant use in determining moves, makes B. essentially a game of chance, and therefore brings two players of unequal talents nearer a level than other diversions in which skill is the sole or predominant element. The B. board consists of two parts or tables, generally united by a hinge in the middle, by which they can be shut up as a box. Each table possesses twelve points, six at each end. These points are coloured white and black alternately; but this variation of colour has no reference to the game, and is only done to make the points more easily counted. The game

is played by two parties, and with 30 pieces or men; each party has 15 men, one set of 15 being black, and the other white. In beginning the game, the men are placed on certain points on the tables, as shewn in the following figure. The game is played with two dice and two dice-boxes. The dice are common to both; but each party uses his own dice-box, and the throws are alternate. Each die is a perfect cube, marked on its sides with dots from 1 to 6. The 1 is called *ace;* the 2, *deuce;* the 3, *tre* or *trois;* the 4, *quatre;* the 5, *cinque;* and the 6, *size*. At every throw, the two dice are employed; consequently, a person may throw from 2 up to 12—that is, two *aces* up to two *sizes*. If a player throw *doublets*, or both dice of one number, double the number of dots is reckoned; thus, by a throw of two aces, the player does not count 2, but 4. These numbers thrown or accidentally turned up by the dice, bear a reference to the points on the tables. In order to understand this connection between the dice and the men, the learner must observe how the men are placed on the points, and the rules by which their shifting from one to another is governed.



The Backgammon Table.

The tables are here spread out as if two partners were seated, and about to begin to play. The party owning the white men is seated at W, and the party owning the black men at B. We shall call one party White, and another Black. White counts round from the ace-point of Black, and Black counts round from the ace-point of White. These ace-points are respectively seen to have two men upon them in opposite corners of the same table. The grand object of the game is for each party to get all his men played round into the table containing the aces, removing them from point to point agreeable to the throws of the dice. In throwing, the number upon each die turned up may be reckoned by it, or collectively, with the number on the other die. Thus, if quatre be thrown by one die, and size by the other, a man can be advanced 4 points, and another 6 points; or one man can be advanced 10 points, always providing that a point is open to suit this movement to it. No point can be moved to if covered by two men belonging to the adversary. If covered by only one man, which is called a *blot*, then that man can be hit, and be removed from the point, and placed on the bar between the tables, his place being taken by the man who has won it. The removal of a man to the bars throws a player considerably behind in the game, because the man must remain of the play till the dice turn up a number co sponding to one open point on the adversary's ta Being fortunate to get an open point by this me the man must be entered and wrought round fr thence, as in the case of others in the set to wh he belongs. The frequent occurrence of this hitt of a blot gives an adversary a great advantage, a allows him to win the gammon. There are t kinds of victory—winning the hit, and winn the gammon. The party who has played all men round into his own table, and by fortun throws of the dice has borne or played the m off the points first, wins the *hit*. The m be explained as follows: When you your men round to your own table, c point, and your adversary has a man o are enabled to *bear* or lift your men away, can bear all away, so as to clear your table be the adversary gets his man placed by a throw your table, you win the gammon. If the adversa has been able to bear one before you have bo all your men, it reduces the victory to a hit. hits are reckoned equal to one gammon in play matches. To win two games out of three is call winning the *rub*, as at whist.

BA'CKHUYSEN, Ludolph, one of the mo famous painters of the Dutch school, a mast in marine painting, was born at Emden in 163 His parents intended him for a commercial caree but he had not been long in a mercan in Amsterdam, to which he had been as u age of 18, before he resolved to devote painting, and with that object received from Evendingen, and attained, in a extraordinary skill and readiness in exec was a close student of nature; so much so the approach of a storm he often put to sea boat, in order to watch and sketch its effects, wh he transferred to canvas immediately on his ret home. His most famous picture is the sea-pie in the gallery at Paris, which he was c to paint by the magistrates of Amste which was, in 1665, sent as a presen XIV. In all his pictures, the utmost t prevails, at the same time that they emb poetry of the sea. His colouring is also After he was 71 years old, he began et copper. He also made attempts in poetry, gave lessons in writing, an art which he di to promote. He died, after long illness, in 17

BACK-STAYS are long ropes which extend the topmast-heads down to the sides of s where they are fastened in such a way as to the shrouds in supporting the masts. kinds are distinguished as *after-B., breast-s., travelling-stays.* One rope generally forms a pair B.; being looped in the middle to pass over t ast-head.

BACON (from a root in the Teutonic la which seems to be allied to the Lat. vacca Lat. *bacu*], a cow, and to have sig ed in general; *backe*, in Ger., signifies a wild sow; *bake*, in Dutch, a swine is the cured sides of a pig; while ba are the hind-legs cured. The mode of be described under Hams; and their as articles of food, under Pork.

BACON BEETLE. See Dermestes.

BACON, Sir Nicholas, the father of Bacon, was born in 1510, at Chiselhur He received an excellent education; gifted by nature with sound and practica he quickly prospered in the legal pro which he attached himself. At the

appointed solicitor to the Court of Aug-
ions; two years later, on the dissolution of
nasteries by Henry VIII., he had the courage
ent to that irascible monarch a reasonable
for applying the wealth which had been
d' from the church. It was this: that
al I employ a portion of it in founding
... the study of politics and diplomacy.
—stely, the king had already squandered it
n presents, and was unable to comply with
e suggestion of the young lawyer; but pro-
se remembered his good sense, for, in 1546,
advanced him to the office of Attorney of
urt of Wards, which he retained during the
f Edward VI.; but his Protestantism neces-
caused him to be deprived of all public
s and emoluments after the subsequent
e succession. On the death of Mary, how-
e was made a member of the Protestant part
Privy Council, by Queen Elizabeth; and
received at her hands the Great Seal. In
anning of 1559, he opened parliament with
ious speech on the difficult subject of a
d religion. He was also president of that
ly of ecclesiastical disputants which met in
minster two months later, to discuss the
of controversy between Protestants and
ics. In 1561, he suffered a temporary eclipse
favour, on account of the too patriotic
of his religion; but through the persever-
... of his old and constant friend, Sir William
e was at length restored to the sunshine in
he had been accustomed to bask. Elizabeth
ent the length of paying him a visit in 1577,
magnificent mansion of Gorhambury, in
rdshire. He died on the 20th of February
Sir Nicholas was one of those solid and
Englishmen to whose sagacity, high principle,
m demeanour his country owed its safety in
ritical period when Elizabeth mounted the

CON, FRANCIS, LORD VERULAM, VISCOUNT
BANS, born in London, January 22, 1561,
e son of Sir Nicholas Bacon (q. v.). His
r was the learned Anne Cooke. In early
ood, he manifested superior powers, and an
love of knowledge; his intelligence was so
ious, and his sedateness so remarkable, that
een took pleasure in calling him her 'young
Keeper.' At the age of thirteen, he was sent
university of Cambridge, which he quitted,
residence of three years, with a low opinion
course of study pursued there, and as well of
istotelian philosophy. On leaving the univer-
e went to Paris, in the suite of Sir Amias
, the English ambassador, and there occupied
f chiefly with statistics and diplomacy, the
of his studies and observation being a work,
ards published, *Of the State of Europe*. The
death of his father, about the end of 1579,
d him in 1580 to England, where, after fruit-
ure from the government a provision which
enable him to devote himself to science and
ure, he betook himself for several years to the
of law. His professional progress was at first
ow, and, contrary to what might have been
ed, it was long before he could turn promo-
the public service. This want of success,
ly owing to the hostility of his uncle, the
first minister, Lord Burleigh, who early
ed him as a dangerous rival to his own son,
d Burleigh and his son, R., in the hope of ad-
ment, had paid court till it was clear no favour
be expected from them, when he took him-
their rival, the Earl of Essex, whose friendship
edily won. But the earl's influence could not
counteract the continued opposition of the Cecils,
through whom he was defeated, in 1594, in an
attempt to obtain for B. the then vacant office of
attorney-general. What he could do for his friend,
however, he did, for shortly after this disappoint-
ment he presented him with an estate at Twickenham
worth £2000 a year. It is painful to relate that B.
repaid the generous friendship of his patron with
flagrant ingratitude. When Essex was subsequently
brought to trial for a conspiracy against the queen,
B. came forward as his accuser with tongue and pen;
he unnecessarily appeared as counsel against the
friend who had so largely obliged and confided in
him, and used all his great talents and ingenuity as
a pleader to magnify his crimes and secure their
punishment. B. was straitened at the time in his
circumstances, through his extravagant mode of life,
and, moreover, was anxious to conciliate the court,
whose anger he had provoked by having espoused the
popular cause on his first entering parliament as mem-
ber for Middlesex in 1593. But whatever the temp-
tation was, it cannot affect our opinion of conduct so
mean and immoral. It remains to be stated, that,
after the earl's execution, he wrote, at the request
of the queen, *A Declaration of the Practices and
Treasons Attempted and Committed by Robert Earl of
Essex*, which was printed by authority.

In 1550, B. obtained the post of Queen's Extra-
ordinary to the Queen, and a few years afterwards,
he entered parliament as member for Middle-
sex. It was not, however, till the reign of James I.
that he made rapid progress. He was knighted in
1603, and in the following year was appointed
salaried counsel to the crown; by 1613, he had
advanced to the office of Attorney-general, in which
he unconditionally subserved the purposes of the
court. His conduct as attorney, in attempting to
extort by the rack a confession of treason from an
old clergyman of the name of Peacham, has met with
universal and deserved condemnation. He did not,
however, cringe to the king and the royal favourite,
Villiers, except to good purpose. In 1617, he was
appointed Keeper of the Great Seal, and in 1619
attained the dignity of the Lord Chancellorship,
with the title of Lord Verulam. In the year follow-
ing, he was created Viscount St Albans.

Having attained the highest honours of the
state by truckling to the king and his favourite,
B. proceeded to abuse his judicial functions to
increase his revenues, which, great as they were,
were unequal to his extravagance. Though his
official income was great, and his marriage had been
enlarged by a marriage with the daughter of a
wealthy alderman, he could only support his style
of life by contracting debt and accepting bribes from
suitors. Nor was it only his only motive to false
judgments; he more than once pulled the stream
of justice, to maintain the favour of Buckingham.
By 1621, the state of the court had become so in-
dulgent as to call for a parliamentary inquiry, which
resulted in his making complete, from his own written
confession, of twenty-three acts of corruption. In
consequence, he was condemned to pay a fine of
£40,000, and to be confined in the Tower during
the king's pleasure; he was banished for life from
the court, and declared unfit to hold any office of
state, or to sit in parliament. The fine, however,
was remitted; the imprisonment lasted only two
days; he was allowed again to appear at court, and,
indeed, was summoned to sit in the very next par-
liament. Age, however, failing health, and perhaps
shame, prevented him from appearing. Banished
from public life, he henceforth devoted himself to
literature and science, enjoying from the government
a pension of £1200, and an annual income, in all, of
£2500. His mode of life still, however, continued

to be so prodigal and ostentatious that, at his death, in 1626, his debts amounted to upwards of £22,000. The immediate occasion of his death (as related by Aubrey, who probably got it from Hobbes, who was B.'s intimate friend) was cold caught in making an experiment to test the power of snow to preserve flesh. He died in the house of the Earl of Arundel, to which he had been removed with the fatal chill upon him which he had caught in the course of the experiment.

While, on the whole, the public life of Lord B. is marked by meanness and dishonour, his literary and scientific works are everywhere irradiated by the powerful light of an intellect which towered over those of other men. The first edition of his *Essays* appeared in 1597; his two books of the *Advancement of Learning* in 1605; his *Wisdom of the Ancients*—in Latin—in 1610; a third edition of his *Essays*, greatly extended, in 1612; his two books of the *Norum Organum*, or second part of the *Instauratio Magna*, designed to consist of six parts—also in Latin—in 1620; his *History of the Reign of Henry VII.*, in 1622; his nine books, *De Augmentis Scientiarum*—a Latin translation and extension of his *Advancement of Learning*—in 1623. Besides these, he wrote several minor works, which need not here be specially mentioned. It is enough to say that his writings embrace almost all subjects, from jurisprudence—which he treated not as a mere lawyer, but as a legislator and philosopher—to morality and medicine. The *Sermones Fideles* is a treasury of the deepest knowledge of human relations, conveyed in a gorgeous and energetic style. Almost the only science with which he was unacquainted was that of mathematics. Thus singularly gifted and accomplished, he appeared at a time when science, from a variety of causes, started on that progress which has never since been arrested. If it is now a question how far he contributed by his genius to that progress at its commencement, it is a fact that he was long vulgarly regarded by his countrymen as the father of Inductive Philosophy—as having been the inventor and first teacher of the method of interrogating nature by observation and experiment and inductive reasoning. Nor are his writings wanting in materials qualified *ex facie* to support his title to that eminence. His claim to the distinction, however, has of late been the subject of much controversy, the result of which is that it has been generally disallowed. But if it be true that he had a somewhat vague and imperfect apprehension of the philosophy of induction, overestimated the province of observation, and undervalued the use of deduction and hypothesis, and that even his classification of the sciences in the *De Augmentis*, on which his reputation long turned, has been properly superseded by the superior and better-reasoned classification of M. Comte; still it must be borne in mind that he was one of the first that was aware of the true character of the positive philosophy, and who understood its conditions, and foresaw its final supremacy; and as for his classification, that it was a marvellous effort of reason at a time when the sciences were in their infancy, and many of them were yet unborn. Also, it must be said, that if B. cannot be claimed by the physicists as the father of their science, and they must look rather to Galileo, yet he may fairly be claimed in that character by the students of man and society; for he was the first to aim at the extension of the methods of positive philosophy to moral and social conceptions. If recent criticisms have dethroned him from the position which for centuries he occupied in relation to the physical sciences, by shewing that neither his doctrines, experiments, nor writings have materially affected their course, it is only to leave him free to be placed in a position no less dignified in relation to human and social philosophy.

As a writer, B. presents us in combination an intellect at once one of the most capacious and profound that ever appeared among men—one of the most penetrating, one of the most far-reaching—and an imagination almost equally remarkable. In no other writer is so much profound thought to be found expressed in such splendid eloquence. 'If,' says Hallam (*Literature of Europe*, iii. 218), 'we compare what may be found in the sixth, seventh, and eighth books *De Augmentis*, in the *Essays*, the *History of Henry VII.*, and the various short treatises contained in his works on moral and political wisdom and on human nature, from experience of which all such wisdom is drawn, with the Rhetoric, Ethics, and Politics of Aristotle, or with the historians most celebrated for their deep insight into civil society and human character—with Thucydides, Tacitus, Philip de Comines, Machiavel, Davila, Hume—we shall, I think, find that one man may almost be compared with all of these together.'

The collected works and life of Lord B. were published by Mallet in 5 vols. (Lond. 1765); a good edition is that of Montague (16 vols., Lond. 1825–1834); but the best, it is generally admitted, is the last (5 vols., edited by Messrs Spedding, Ellis, and Heath, Lond. 1858). Montague's edition gave occasion to an able review of B.'s character by Lord Macaulay, to be found among his *Essays*. The *Encyclopædias Britannica* and *Metropolitana* contain valuable papers on his writings, on which also Sir John Herschel's *Preliminary Discourse* in *Lardner's Encyclopædia* may be consulted.

BA'CON, Roger, an English monk, who, through the force of his intellect, raised himself far above his age, made wonderful discoveries in several sciences, and contributed much to extend the then scanty knowledge of nature. He was descended of a respectable family, and born at Ilchester, in the county of Somerset, 1214. He studied at Oxford, and then at Paris, where he received the degree of Doctor in theology; and soon after his return home, he entered the order of the Franciscans, and settled at Oxford. Physics seems to have been at that time the chief object of his labours; and liberal friends of science supplied him with the means of pursuing his researches. In exploring the secrets of nature, he made discoveries and invented applications which were looked upon by the ignorant as the work of hellish magic. This prejudice was encouraged by the jealousy and hate with which his brother monks regarded his superiority. Besides, he loudly denounced the ignorance and immorality of the clergy, especially of the monks, and even wrote a letter to the pope, in which he represented to him the necessity of clerical reform. Out of revenge, an accusation was brought against him at the papal court, and the pope interdicted him from teaching in the university. He was shortly after imprisoned, forbidden all human intercourse, and hardly allowed sufficient food. Among the few clear-sighted men who admired Bacon's genius, and pitied his misfortunes, was the cardinal-bishop of Sabina, at that time papal legate in England. He desired to see Bacon's writings, but the interdiction of the Franciscans prevented a compliance with his wish. On his ascent to the papal throne as Clement IV., B. wrote to him, expressing his readiness to furnish him with whatever he desired, and Clement in reply repeated his request to see B.'s works, in defiance of the Franciscan prohibition. B. accordingly drew up his *Opus Majus* (edited by Jebb, 1733), which he sent, along with two other works, it is said, to the

pope, by his favourite pupil, John of London, and in which he represented the necessity of a reformation in the sciences through a diligent study of the languages and of nature. How Clement received them is not very well known; but they could only have reached him about the time he was seized with his last illness. For ten years after Clement's death, B. was free from open persecution at least. But in 1278, under Nicolas III., the general of the Franciscan order, Jerome of Esculo, declared himself against B., forbade the reading of his books, and issued an order for his imprisonment, which was sanctioned by the pope. This new imprisonment lasted ten years. When Jerome of Esculo became pope, under the name of Nicolas IV., B. sent him a *Treatise on the Means of warding off the Infirmities of Old Age* (Lat. Oxf. 1590; Eng., by Brown, 1683), with a view to convince him of the harmlessness and utility of his labours, but in vain. What the pope refused to the representations of the old philosopher, was yielded to the intercession of several influential English noblemen, and B. at last recovered his freedom. He returned to Oxford, wrote a compendium of theology, and shortly after died—according to some, in 1292, to others, in 1294.

B., although an extraordinary genius, could not rid himself of all the prejudices of his times. He believed in the philosopher's stone and in astrology. His chief invention is the magnifying-glass. There are also in his writings other new and ingenious views on optics; for example, on refraction, on the apparent magnitude of objects, on the great increase in the size of the sun and moon in the horizon. On other subjects, again, he fell into the greatest errors. He made several chemical discoveries which were wonders at that time. He knew, for instance, that with sulphur, saltpetre, and charcoal, we may imitate lightning, and produce explosions. Mathematics, applied to observation, he considered to be the only means of arriving at a knowledge of nature. He studied several languages, and wrote Latin with great elegance and clearness. Deserving of honourable mention are his discoveries of the errors that prevailed in the calendar, and his proposals and data for remedying them, in which he came very near the truth. He prepared a rectified calendar, of which a copy is preserved in the Oxford library. On account of his extensive knowledge, he received the name of 'Doctor mirabilis.' Several of his works have never been printed, and are preserved among the Cottonian manuscripts in the British Museum; some are to be found in French libraries.

BA'CON, JOHN, a distinguished statuary, was born in London, 1740, and died there August 7, 1799. He was at first a painter on porcelain, and only began to work in marble at the age of 23; yet in 1769 he received the first prize from the Royal Academy, of which he was soon after made a member. His statue of Mars first established his fame. Among his principal works are, two busts of George III., one in Christ Church College at Oxford, the other in the university library at Göttingen; the monuments of Lord Chatham in Westminster Abbey and in Guildhall; the statues of Howard and of Samuel Johnson in St Paul's, and that of Chatham at Oxford. B. was deficient in imagination, and had no refined perception of beauty.

BA'CSÁNYI, JANOS (pronounced Bat-shan-yi), a Hungarian writer and poet, was born May 11, 1763, at Nagy-Ida, in the circle of Szalader. After studying at Veszprim, Oedenburg, and Pesth, he became tutor to the son of General Orczy, and while thus employed published his first work, *The Valour of Women* (Pesth, 1785). He received the same year appointment in the finance department at Kaschau, and there, in conjunction with Baroti and Pazinczy, he began the *Magyar Museum* (Kaschau and Pesth, 1788–1792). In 1793, in consequence of a liberal poem, he was deprived of his office, and in 1794, having taken part in the conspiracy of Bishop Martinovich, he was carried to Spielberg, where he was confined till 1796. After recovering his freedom, he assisted in editing the *Magyar Minerva*, then came to Vienna, where he held an office in the bank, and married (1805) the German poetess, Gabrielle Baumgarten—an unhappy match. When the French entered Vienna in 1809, B. translated Napoleon's proclamation to the Hungarians, on which account he found himself afterwards obliged to take refuge in Paris. After the peace of Paris, he was given up, and had Linz assigned him as a compulsory residence, but was allowed to receive his French pension till his death. He died at Linz, May 12, 1845: the Hungarian Academy had in 1843 again elected the octogenarian a corresponding member. In the latter part of his life, B., besides other works, published his *Collected Poems* (Pesth, 1827; Ofen, 1835). We are also indebted to him for the collected edition of the poetical works of Anyos (Vienna, 1798) and of Faludi (Pesth, 1824).

BA'CTRIA, the ancient name of the imperfectly known land lying between the western part of the Hindu Kush mountains, and the river Oxus (Amu, or Gihon), which separated it from Sogdiana on the north and north-east. Its boundaries in early times cannot be precisely ascertained, but it is generally considered to have been identical with the modern Balkh (q. v.). B. is supposed to have been the seat of the parent-people from which the Aryan (q. v.) or Indo-European family of nations branched off. The ancient Bactrians of historic times were akin to the Medes and Persians, and used the Zend language. B. was originally the centre of a powerful kingdom, which extended itself over the east of Persia, but we have almost no record of its early greatness; we only know that Ninus, the Assyrian king, in spite of his vast army, found much difficulty in conquering it, and that when Arbaces besieged the last Assyrian king, Sardanapalus, in his metropolis, he was assisted by a large force of Bactrians. It is believed that the ancient Persian religion was first developed in Bactra or Zariaspa, the capital of B., which was the head-quarters of the Magi till the land was overrun by the Arabs, and a centre-point of the inland trade of Asia. The modern town of Balkh (q. v.) is built upon its site. Alexander, on his return from Persia, left in B. a colony of 14,000 Greeks, who here extended civilisation. After the death of Alexander, B. was annexed to the kingdom of Syria; but was raised to independence by its governor, Diodotus I., who founded the Greek kingdom of New B. about 256 B.C. The history of this kingdom was formerly little known, but has been recently elucidated by numerous Graeco-Bactrian coins found in the *topes* or burial-places of Afghanistan. These coins give the names of a series of kings, and bear indications of the political circumstances of the Greek kingdom of B. On those of Eucratides, a monarch who flourished in the age of Mithridates, there are found, beside the Greek characters, others which have been proved to belong to a dialect of the Sanscrit, and have been very happily deciphered by Mr Prinsep.

BA'CTRIS, a genus of Palms, of which nearly fifty species are known, all American. The leaves of some are pinnate, those of others entire. They are generally small palms, some of them very small, and with slender stems; that of *B. tenuis* is not thicker than a goose-quill. Some are spiny, and form thickets not easily traversed. *B. acanthocarpa*

is called TUCUM, near Bahia, and from it an extremely tough thread is obtained, which is used for making nets. *B. Maroja*, the MARAJA' palm, produces large clusters of fruit, resembling small grapes, with a thin pulp of an agreeable subacid flavour.

BACTRI'TES, a genus of fossil *Ammonitidæ*, with a straight shell, and indented but not ramified septa. Five species have been described, all from Devonian strata.

BA'CULITES, a genus of the family of *Ammonitidæ*, differing from the true *Ammonites* (q. v.) in the perfectly straight form of the shell, which tapers to a point, and is either round or compressed. The species, like the other Ammonitidæ, are all fossil. B. are characteristic of the upper chalk, and appear to have existed only towards the expiry of the period over which the existence of the Ammonitidæ extended.

Baculite.

BADA'GRY, a seaport town on the Gold Coast of Upper Guinea. Pop. 10,000. At one time it carried on a large trade in slaves with the Portuguese, who here established several factories. B. has a monarch, who is subject to the king of Katunga. It was from this place that Lander and Clapperton started on their expeditions to explore the African interior.

BADAJO'Z, called by the Romans Pax Augusta, and by the Moors Beledaix, i.e. 'Land of Health,' is the capital of the Spanish province of Estremadura. It is situated about five miles from the borders of Portugal, in a fruitful district on the left bank of the Guadiana, which is here crossed by a stone-bridge of 28 arches. It has 22,195 inhabitants, is a fortress of the first rank, the residence of a captain-general, and the see of a bishop, and has an old cathedral with a splendid organ, and paintings by Mateo Cerezo and Morales, who was born at B.; a brisk traffic, chiefly contraband, is carried on with Portugal. Its chief articles of manufacture are soap, coarse woollens, leather, and delft-ware. As one of the keys of Portugal, B. has often been a place of importance in war. It was besieged in vain by the Portuguese in 1660, and again by the allies, in the Spanish War of Succession, in 1705. During the French war, B. was besieged by the French in 1808 and in 1809, and again in 1811, when it surrendered, March 11, to Soult. It was thrice besieged by the English under Wellington: first on April 17, 1811, after the conquest of Olivenza, on which occasion, the approach of Soult to its relief caused the siege to be raised on the 14th of May; the second time, after the battles of Fuentes d'Onor and Albuera, the city was invested from May 27 to June 10, 1811, but still in vain. The third investment, March 17, 1812, ended in the taking of the city by storm, on the night of April 6, after a murderous contest, and a loss during the twenty days' siege, of 72 officers and 963 men killed, and 306 officers and 3483 men wounded. The garrison and their commander, General Philippon, became prisoners of war.

BADAKHSHA'N, or BUDUKHSHA'N, a territory of Central Asia, lying between 36° and 38° N. lat., and 69° and 73° E. long. B. lies between the chain of the Hindu Kush and the Oxus. It is drained by the Kokcha, a tributary of that river, and is famous throughout the East as a picturesque hill-country covered with woods, rich pasture, and fertile and well-cultivated valleys. Eastern travellers speak with rapture of its rich orchards, its fruits, flowers, and nightingales. In recent times no European traveller has visited it except Captain John Wood, who only saw it in the winter of 1838. The inhabitants are Tajiks, or an Aryan race speaking Persian and Turkee. They are Mohammedans—Sheas in the mountains, and Sunnas in the plains. Their number is estimated at 350,000. One of their chief occupations is man-stealing—their captives being chiefly Kafirs and Chitralis from the Indian side of the Hindu Kush. The people of B. seem to have been always under the immediate rule of their own chiefs, at the head of whom was 'the Mir.' They have generally, however, formed part of some great Asiatic empire. In the last century, B. formed part of the empire of Nadir Shah, after whose death it became subject to the Afghans. In 1823, however, the Uzbecks, under Murad Beg, taking advantage of the disturbed state of Afghanistan, defeated the tribes of B. in a pitched battle; and two years after, their subjection was completed. Their conquerors treated them most harshly, demolishing their towns, and either selling them as slaves, or carrying them off to people the unhealthy swamps of Kunduz. On the death of Murad in 1845, B. seems to have become for a time independent. The Afghans, however, soon reasserted their claims. In 1859, they conquered Kunduz, and were about to annex B., when the Mir agreed to pay an annual tribute. In 1863, Jehander Shah, the Mir of B., was superseded by Mir Mamud Shah, another of the royal family of B., supported by the Afghans. This gave rise to a struggle which had not terminated in December 1873.—B. is sometimes made to include Wakan, on the Upper Oxus, between B. Proper, and the Pamir Steppe (see BOLOR). It is a mountainous country, barren on the south and east. It is thinly peopled, and subject to B. Proper.—See Yule's *Marco Polo*; articles on Central Asia and Afghanistan in *Quarterly Review*, April 1873; and *Edinburgh Review*, July 1873.

BA'DDERLOCKS, or HEN'WARE (*Alaria esculenta*), a sea-weed (see ALOÆ, where a figure of it is given), of the sub-order *Fucaceæ*, growing on rocks in deep water on the shores of Britain, Iceland, and the northern parts of Europe. It has a stem 4—8 inches long, pinnated with a few short leaflets, which contain the seeds, and a membranous olive-green frond of 2—12 feet long, with a stout mid-rib. The frond being stripped off, the mid-rib forms an article of food to the inhabitants of the sea-coasts of Iceland, Denmark, Scotland, Ireland, &c. The thinner part of the frond is also sometimes eaten.

BA'DEN, THE GRAND DUCHY OF, is situated at the south-western extremity of the German Empire. With an area of 5900 square miles, it runs in the direction of the valley of the Upper Rhine and of the Black Forest, from the southern bend of the Main at Wertheim to the Bodensee or Lake of Constance, and is bounded on the N. by Bavaria and Hesse-Darmstadt; on the E. by Hohenzollern, Würtemberg, Bavaria; and on the W. and S. by the Rhine, which separates it from Rhenish Bavaria, Alsace, and Switzerland. It is divided politically into four circles—the circle of the 'Lake,' at the south, and the circles of the 'Upper Rhine,' of the 'Central Rhine,' and of the 'Lower Rhine;' these are again divided into 70 districts.

Surface and Hydrography.—Physically, B. falls into two divisions—the western plain, lying along the right bank of the Rhine, and the eastern highlands; the plain occupying about a fifth of the whole duchy, and the hilly part, four-fifths. Of the mountain-ranges, the Schwarzwald, or Black Forest, is the most prominent. See BLACK FOREST. For a distance of 96 miles, it belongs almost exclusively to

. It terminates in abrupt declivities towards
st, and on the east descends by degrees into
lateau of the Neckar in Wurtemberg. It
es in height from south to north, its mean
n being from about 4000 to 2700 feet,
cut up into sections by numerous deep and
romantic valleys. The most remarkable
its are Feldberg and Belchen in the south.

tributaries of the Rhine, on the B. side,
Neckar, the Kinzig, the Murg, the Elz, the
n, and the Pfinz. On the north-east the
territories are bounded by the Main, which
receives the Tauber. Except a part of the
ee, B. has no lake of importance. In the
rzwald, however, there are the following
of water which go by the name of lakes:
lsee, Wildsee, Feldsee, Titisee, and the
nnattweiher, with a floating island.

ate.—As the difference between the highest
west points of B. Feldberg, which rises to a
of 4892 feet, and Manheim amounts to some-
like 4500 feet, there is naturally a great
of climate, especially in respect of tempera-
The mean temperature of the plains may be
at 50°, and that of the highlands at 44
so that the Rhine valley of B. is one of the
st and most fruitful districts, not only of
ny, but of Europe; the land yielding often,
case of maize, a return of more than three
dfold. Walnuts, cherries, apples, and pears
n abundance, while the western terraces of
hwarzwald are decked with vines. On these
declivities, the walnut thrives at a height
feet, the grape at 1450 feet; other kinds
are cultivated in the higher regions to
vation of more than 2000 feet. The wild

it two-thirds of the population are engaged
cultivation of the land, which, as may be
d from the description, yields rich returns.
a of about 3280 square miles is occupied
and gardens, growing wheat, oats, rye,
ize, potatoes, pulse, and vegetables of
Tobacco, hemp, rape, opium, &c., yield a
evenue. Meadow land and pasturage occupy
fifth of the surface. An important branch of
tion is also the production of chestnuts, wal-
lmonds, &c. The quantity of wine produced
is, on an average, 14 million gallons. About
1790 square miles are under wood. The Schwarz-
wald is one of the most remarkable pine-forests of
Germany. There whole tracts may be seen of pines
of the height of from 160 to 180 feet, which are
exported to the Netherlands for ship-building. The
rearing of cattle is carried on to a large extent.
The several kinds of stock may amount to the
following numbers: horses, 73,200; asses, 700;
cattle, 481,000; sheep, 189,000; goats, 22,100;
swine, 480,000; making a total of 1,246,000 head of
animals, and representing a large amount of wealth.
Honey is also an important product, more than
74,000 bee-hives being kept in the duchy. Various
societies exist for improving the breed of horses and
perfecting agriculture.

Minerals.—The mineral wealth of the country
does not seem to be valued yet as it deserves, if we
may judge from the extent of mining operations
carried on; but the activity of the Mining Society at
Carlsruhe is yearly bringing this department of the
national industry more and more into a fitting
condition. Iron, lead, silver, copper, and salt are
among the chief productions; gold is extracted from
the sands of the Rhine, near Wittenweier, and
cobalt, sulphur, marble, and several kinds of precious
stones are found. B. is rich in mineral springs;
as many as 60 are enumerated, some sulphureous,
some chalybeate, and some acidulous. Hence there
are a great number of much frequented watering-
places, as Baden-Baden, Badenweiler, Griesbach,
Petersthal, &c.

Manufactures, &c.—The increasing activity in the
various branches of industrial art is testified by
the existence of over 400 large manufactories, with
from 50,000 to 60,000 hands, and a yearly produce
of from 18 to 20 million florins. The industrial
activity extends chiefly to the following articles:
ribbons and cotton fabrics, mostly at St Blasia;
toys and trinkets, and tobacco, which occupies the
first place; chicory, paper, cloth, leather, beer,
wooden clocks, and articles of straw; the last two
are characteristic of the Schwarzwald districts, and
known all over the world. The chief articles of
export are wine and timber, which last is sent almost
exclusively to the Netherlands, and brings in a sum
of at least 3 million florins (£250,000). The prin-
cipal imports are colonial goods, fruits, drugs, horses,
wool, cotton, silk-goods, iron, steel, and articles of
luxury. Money is reckoned in guldens or florins of
24 to the mark of silver, a florin being equal to 20*d.*
sterling. Weights and measures are divided accord-
ing to the decimal system.

Population, Religion, Education.—The population
of B., in 1871, amounted to 1,461,562, being an in-
crease of above 20,000 as compared with 1867.
With the exception of Jews, the inhabitants are
exclusively German. The dominant church is the
Roman Catholic, whose adherents, in 1871, num-
bered 942,560, or about two-thirds of the whole
population. Protestants numbered 491,008; Dis-
senters and Mennonites, 2265; and Jews, 12,475.
The school-system of B. is excellent; it offers the
means of instruction to every individual; and a
multitude of libraries, museums, and collections of
all sorts, are significant indications of the higher
elements of culture.

Government.—The sovereignty of the grand duchy,
which is strictly indivisible and inalienable, is here-
ditary in the eldest of the male line, and, failing
that, of the female. The heir-apparent is styled
Hereditary Grand Duke, and the other sons and
daughters are called Margraves and Margravines.
The sovereign is bound down by a parliamentary
constitution. The parliament, which meets regularly
every two years, consists of two chambers. The
first chamber consists of the princes of the grand-

ducal house, the heads of the seignorial families (seven princes and three counts), and of the nobility —on whom, when they possess hereditary property, under feudal tenure, to the value of 300,000 florins, the king confers the rank of the high nobility—the Catholic archbishop and the Protestant prelate, two representatives of the universities, and eight members chosen by the grand duke, without regard to rank or birth. The second chamber consists of 63 representatives chosen for eight years, 22 for the cities, and 41 for the country districts, giving one representative for about 21,540 inhabitants. As to the franchise, less regard has been paid in B. than elsewhere to the property qualification; every settled citizen and all state officials may take part in the nomination of electors, and may become electors; only representatives must either pay tax on a capital of 10,000 florins, or be in possession of an ecclesiastical or secular office bringing in at least 1500 florins. The highest deliberative and executive body in the country is the council of state. The grand-duke is its president, and it is divided, since 1870, into the ministries—(1) of the Grand Ducal House, of Justice, and of Foreign Affairs; (2) of the Interior; (3) of Commerce. The expenditure, according to the ordinary estimates for the united years 1872—1873, was 37,529,349 florins; the estimated net receipts for the same years just balancing the expenditure. In the receipts are comprised 2,926,950 florins, and 2,265,191 florins for 1872 and 1873 respectively, derived by the exchequer of B. from the French indemnity. There is a particular budget dealing with the finances of the railways, and the steamers on the Lake of Constance. 26½ millions of florins were added to the public debt of the country by the events of 1848 and 1849. The general debt of B. in 1873 amounted to 29,304,294 florins; that on the railways to 134,838,423 florins. The military affairs of B. are now exclusively regulated by the imperial power; the troops of B. form the major part of the fourteenth corps d'armée of the empire. The effective war-strength of the army in 1868 was 43,705; peace, 14,263. There exist three orders of knighthood, besides a medal for military service, and other decorations of merit. The capital and residence of the sovereign is Carlsruhe; the capitals of the four 'circles' are Constanz, Freiburg, Carlsruhe (formerly Rastadt), and Mannheim.

History.—The original inhabitants of B. were Alemanni. These fell under the dominion of the Franks, the conquerors of Gaul, and submitted at the same time to the Christian religion. Under their duke, Gottfried, they made repeated attempts to regain their independence, but in vain; and the dukedom of the Alemanni was abolished in 748 by Pepin the Little. In the 11th c., a Duke Berthold, said to have been a descendant of the Alemannian Gottfried, built the castle of Zähringen in Breisgau, and with him begins the unbroken line of the princes of the House of Zähringen. A descendant of his second son took the title of Margrave of B., and became the ancestor of the still flourishing House of Baden. He died in 1130. The history of this House presents, for long, little else but a succession of partitions of the territories among brothers, to be again and again reunited by one or other of the collateral branches becoming extinct. The prosperity of the country was thus greatly retarded. The present capital, Carlsruhe, was built in 1715 by the reigning count, Charles III. It is to his grandson, Charles Frederic, who succeeded in 1746, that B. owes considerable accessions of territory and political importance. By favouring the policy of Napoleon, and joining the Confederation of the Rhine, he doubled his possessions in extent and population, and acquired successively the dignity of elector and the title of grand duke. In 1811 he was succeeded by his grandson, Charles Ludwig Frederic, who, five years before, had married Stephanie Louise Adrienne Napoleone, an adopted daughter of Napoleon. After the battle of Leipsic, Charles Ludwig seceded from the Confederation of the Rhine, and (1815) joined the German Confederation, in which B. holds the seventh rank.

The original constitutions or 'states' of the separate territories composing the grand duchy having mostly become extinct, the Grand Duke Charles granted (1818) the charter which forms the basis of the present constitution. Charles was succeeded in the same year by his uncle Ludwig, who was inclined to absolutism, and had to contend at first with a powerful opposition, which led him frequently to dissolve the Chambers. He succeeded, in 1825, in carrying through an alteration of the constitution, extending the duration of the parliaments; after which the government and the Chambers acted more harmoniously. Ludwig dying childless (1830), was succeeded by his brother Leopold. The known liberal tendencies of this prince promised at first a new life to constitutional government; but the tide of reaction, become strong since the fall of Warsaw, soon seized the government, and the act establishing the freedom of the press, which in 1831 had been hailed with delight by B. and the whole of Germany, was, in 1832, declared impracticable and abrogated. A fluctuating contest between a reactionary government and a growing opposition was carried on till 1846, when the constitutional Bekk was made minister of the interior, and liberalism thus placed at the helm. The first effect was to calm the public mind, and to cause a split between the liberals and the radicals. The ninth parliament met (December 1847) under the most friendly and promising auspices; when the French revolution (February 1848), the vibrations of which were first felt by B., suddenly called the radical party into the most violent activity. Not satisfied with a multitude of liberal measures passed by the legislature, the revolutionary leaders, Hecker and Struve, aimed at establishing a republic, and stirred up an insurrection. The troops having sided with the insurgents, the grand duke fled, and a Constituent Assembly was called (May 1849). The duke had recourse to Prussian aid, and after several battles, was reinstated on his throne (July 1849). The restoration was followed by some thirty executions, consisting chiefly of soldiers that had borne arms against the government, and of a few political leaders. Upon the whole, the reactionary tendency has been less marked in B. than in most other German states, and many valuable reforms effected in 1848 have been retained. See GERMANY, in SUPPLEMENT.

BA'DEN, a town and fashionable watering-place in the canton of Aargau, Switzerland, is situated on the left bank of the Limmat. It has a population of 3412. It is of ancient date, being known to the Romans as *Thermæ Helveticæ*. The temperature of the baths is as high as 117° Fahrenheit. B., from the 15th to the beginning of the 18th c., was the seat of the Swiss diet.

BA'DEN-BADEN, a town in the grand duchy of Baden, situated in a pleasant valley at the base of the Black Forest. It contains (1871) 10,083 inhabitants; but its visitors during the season, which is at its height in July and August, are often double the number of the settled population. It is chiefly celebrated for its medicinal springs, which were known in the time of the Romans. B. having been a fashionable place of resort so early as the days of Antoninus and Aurelius, numerous Roman

have been found in the neighbourhood, and ed in a museum here. There are several a saline character, varying in tempera- 117° to 154° F. These springs are impreg- iron, magnesia, and lime, with sulphuric ic acid, and are especially recommended cutaneous diseases, gout, rheumatism, &c. spring discharges in 24 hours about 4200 of water. The gaming-tables of B., the wned in Europe, were closed with the licensed German gaming-houses in 1872.

BEI WIEN (i.e., 'Baden near Vienna'), quented watering-place of Lower Austria, en miles S.S.W. of Vienna. It was the *nonia* or *Cetiæ* of the Romans, and is s for its warm mineral springs, which nted during the season by from 12,000 persons chiefly from the Austrian capital. rature varies from 90° to about 99° F. are frequented by persons of both sexes, e bath, promenade arm in arm. Many strian nobility have palaces here. The valk in the neighbourhood is along the alley, the Helenenthal. Pop. 5847.

BOCH, a Highland district in the south- of Inverness-shire, 30 miles long by 15 nded by Lochaber, Athole, Braemar, and nd traversed by the Spey. It is much ith forest, and is chiefly composed of , with a little granite. It was a lordship, g the 13th c. by the eldest branch of the se of Cumyn, on whose forfeiture Bruce it on his nephew Randolph. In 1371, ert II. gave it to his son, 'the Wolf of ' on the failure of whose descendants it the crown, which, about 1456, granted it l of Huntly.

**, the term by which, in general, all decorations and special cognizances are badges are either conferred by the state n, or assumed by the individual for pur- istinction, the former class having very had their origin in the latter. Of badges by public authority, for the purpose of exertion, and gratifying honourable ambi- rous instances are to be met with in every world. The garter of the English knight, fleece of the Spanish grandee, and the the Chinese mandarin, will occur as fami- les. To the same class belong not only nd crosses with which princes and other rank are adorned in this country, and to er extent on the continent, but the medal ivate soldier, and even those not less decorations which are now frequently by private societies for acts of voluntary h as the medal given by the Humane saving from drowning. Amongst the e of the most usual emblems of authority l ring, which was worn generally on the ger. A ring of this description was the senatorial and magisterial dignity, and knighthood at Rome; iron rings, during period, at all events, having been used by izens. The right of wearing a gold ring *i aurei*) was gradually extended, till at tinian conferred it on all the citizens of e. In the early times of the republic, assadors were sent to foreign states, they ished with gold rings, which they wore ir mission as badges of authority. From eriod, every freeman in Greece appears to a ring, though the custom, not being men- Homer, can scarcely have belonged to the riod of the history of that people, and is commonly supposed to have been of Asiatic origin. Rings are often mentioned in Scripture as badges of authority both amongst the Jews and other oriental nations. We read of Pharaoh taking off his ring and putting it on Joseph's hand, as a token of the power which he committed to him (Gen. xli. 42); and still earlier (Gen. xxxviii. 18), Judah left his signet with Tamar as a pledge. In the New Testament, rings are spoken of rather as marks of wealth and luxury than as badges of official rank; e.g., James ii. 2, and Luke xv. 22, where, on the return of the prodigal son, the father ordered that a ring should be put on his finger. As to the workmanship and materials of ancient rings, see RING, SIGNET, &c. Of badges assumed for the purpose of distinction, none are more famous than the white and red roses of York and Lancaster. Henry VII. combined these two emblems, first carrying a rose per pale, white and red, and afterwards placing the white rose within the red one. One of Queen Elizabeth's badges was a golden falcon perched on the stump of a tree between two growing branches of white and red roses, a B. which is said to have been given to her mother, Anne Boleyn, by Henry VIII. The *bear and ragged staff*, which still exists as a sign in London, was the B. of the great Earl of Warwick. The *white hart* and *silver swan*, which are frequently met with as signs to inns, have a similar origin, the first having been the B. of Richard II., and the second having belonged to the House of Lancaster. The *garb and sickle*, the B. of the

Garb and Sickle.

Hungerfords, is another very beautiful and less common example of the same class of badges. Different countries have also distinctive badges, generally connected with the history either of the actual ruling or of some former dynasty. Of these, the *fleur de lis* of France (represented in the accompanying engraving of the seal of Louis VII.), and the other badges, for which it from time to time makes way—viz., the cap of liberty and other emblems of republicanism, the eagles of the Empire, borrowed from Rome, and the bees and other insignia which the Bonaparte family have assumed, may all be taken as examples.

Fleur de lis of Louis VII.

B. of England.—The present B. of England is a rose white and red, ensigned with the royal crown. The initials V. R., ensigned with a crown, which are used on military accoutrements, is also a species of national badge.

B. of Scotland is a thistle ensigned with a royal crown.

B. of Ireland.—Ireland has two national badges—the golden harp and the trefoil, both of which are carried ensigned with the royal crown.

The three badges of England, Scotland, and Ireland, carried conjoined, may be seen under any representation of the royal arms.

B. of Wales is a dragon passant, wings elevated, gules, on a mount vert.

B. of Ulster is on a shield or canton, *or*, a sinister hand erect and apaumée, *gu.* This B., which is popularly known as 'the bloody hand,' is borne in the paternal coats of English baronets.

B. of Nova Scotia, which is borne by the Nova Scotia baronets, is, *or*, a saltire *azure*, thereon an escutcheon of the arms of Scotland, and ensigned with an imperial crown, the motto being, *Fax mentis honestæ gloria.*

One of the oldest and most celebrated badges in existence is the so-called jewel of King Alfred. For

Alfred's Jewel.

An ornament of gold, apparently intended to hang round the neck, found in Athelney, and now in the Ashmolean Museum, Oxford. The inscription on the side here represented, around the female figure holding flowers, is 'Aelfred me haet gewercan' (Alfred had me wrought). On the other side is a flower. The workmanship is in a good style.

the badges of the different orders of knighthood, see their respective titles.

BA'DGER (*Meles*), a genus of quadrupeds of the Bear family or *Ursidæ* (see BEAR), and included by Linnæus in the genus *Ursus* or Bear, but forming a sort of connecting-link between this family and the *Mustelidæ* or Weasel and Otter family. To the Skunks (q. v.), which are ranked in that family, the badgers have a particularly strong resemblance, and their dentition and habits are almost the same. The dentition of badgers differs from that of bears chiefly in the large size of the tuberculous molar teeth at the bottom of each jaw, shewing a still greater adaptation to vegetable food. Badgers, like the rest of the family to which they belong, are plantigrade, i. e., they walk on the whole sole of the foot, and not merely on the fore part of it. The body is thus brought nearer to the ground than it otherwise would be from their length of limb. The head is long, with a pointed muzzle, the tail short, the skin very thick and tough, the hair long. The gait is slow, the habits nocturnal and solitary. There are five toes on each, both of the fore and hind feet, and the feet are peculiarly adapted for digging and burrowing. A peculiar characteristic of the badgers, not found in any other quadrupeds of the same family, is the possession of a bag, beneath the tail, for the secretion of a peculiar substance, of a disagreeable odour, which is supposed to be of use in directing the sexes to each other in their solitary wanderings.—The common B. (*M. Taxus* or *M. vulgaris*) is the only quadruped of the Bear family now found in the British islands. It is widely diffused over Europe and the middle parts

Badger.

of Asia. It is grayish brown above, and black beneath; the head white, with a longitudinal black band on each side; the body long but robust, in size about equal to that of a small fox, the hair coarse and reaching to the ground as the animal walks. The average length is 2 feet 6 inches, and the height at the shoulder 11 inches. It haunts the gloomy recesses of woods, or thick coppices on the sides of hills, and digs for itself 'a deep and well-formed domicile, consisting of more than one apartment, the single entrance to which is by a deep, oblique, and even tortuous excavation.' The innermost chamber is circular, and lined with grass and hay. The B. makes use of its nose in digging, scrapes with the fore-paws, flinging the earth as far back by them as possible, and when the accumulation is considerable, pushes it away by means of the hind-feet. The B. is extremely cleanly in its habits. It is one of the most perfectly omnivorous of animals, in a wild state as well as in confinement; fruits, roots, beech-mast, eggs, young birds, small quadrupeds, frogs, snails, worms, and insects, equally constitute its natural food. It has been known to visit a garden for strawberries. It is also fond of honey, and of the larvæ of wasps and wild bees, for the sake of which it digs up their nests, its hide being impervious to their stings. It is often caught by placing a sack in the mouth of its hole, when it is out at night; dogs are then sent into the wood to alarm it, upon which it flees to its hole. Dogs sent into the hole are often foiled by earth which the B. throws back upon them, to block up their way, nor is it easy for a dog to contend with it, owing to its great strength, and particularly the strength of its jaws. A barbarous sport was formerly, and to some extent still is practised, called B.-baiting, or *drawing the badger.* A badger kept in a barrel was assailed by dogs, and at last, yielding to superior numbers, was dragged out, upon which it was released, and allowed to go back to its den, to recover itself, and be baited again, which happened several times daily, when the B. was kept as an attraction to a public-house of the lowest sort. The verb to *badger*, expressive of persevering annoyance by numerous assailants,

riginally employed with reference to the
e of B.-baiting. The flesh of the B. is said
very agreeable, particularly when cured in
m of hams. It is much used in China. The
easily domesticated when taken young, and
es very familiar. In Scotland and the north
gland, a B. is still called a *Brock*, its Anglo-
name; and in some parts of England it is
l a *Grey*, from which some derive greyhound.

Balysaur of India, also called the Sand
and Indian B. (*M. collaris*), very much
les the common B., but is taller, and has a
og-like muzzle, and a longer tail. Its habits
d food are similar to those of the common
l when attacked, it defends itself with great
. It is chiefly found in hilly districts.—The
can B. (*M. Labradorica*) was at first supposed
a mere variety of the European B., but has
l to be very distinct, so that it has been
ed by some naturalists as worthy of a separate

DI'A-Y-LEBLICH, Domingo, known also by
Ali-Bei-el-Abbassi, one of the most enter-
, as modern travellers, was born at Barcelona,
1, 1767. He studied the Arabic language,
lso physical science and mathematics at
ia. Possessed of a lively and restless spirit,
med the project of visiting Africa and Asia,
the disguise of a Mussulman, both for the pur-
f avoiding the suspicions of the natives when
g those places forbidden to Christians, and
or giving greater *éclat* to his adventures. In
nce of this scheme, therefore, he resigned an
under government in the year 1797, and went
drid, to make proposals of a scientific and
atile tour of exploration in Africa. Having
promises of support from Don Godoi, the
of Peace, he betook himself for a short time
ndon, to study commerce and politics. He
pared no labour to make himself familiar
the manners and customs of the people
about to visit; and in his anxiety to
detection, he even ventured to undergo
vere ordeal of circumcision. In 1803, he
for Africa, where he represented himself,
the name Ali-Bei, as a descendant from the
ides. His tact and talents gained for him
steem that he was invited to the court of
mperor of Fez and Morocco. After a two
residence in Morocco, he set out on a pilgrim-
o Mecca in 1805, and after sojourning some
Tripoli, Cyprus, and Egypt, arrived at the
ce in 1807, being the first Christian that had
it since the institution of Islam. Subse-
y, he visited Jerusalem and the chief places in
ine and Syria, and in the autumn of 1807
arrived at Constantinople, whence he had soon to
flee, the reality of his Mohammedanism being sus-
pected. After his return to Spain, he was made
Intendant of Segovia and Prefect of Cordova; but
the easy way in which he shelved his patriotism, and
submitted to the French conquerors, was fatal to
his prospects, for, on the expulsion of the latter, he
was compelled to leave the country. He went to
Paris, where, in 1814, he published an account of
his travels under the title *Voyages d'Ali-Bei en
Afrique et en Asie pendant les Années* 1803 *à* 1807.
His work was translated into most of the European
languages. Four years after the publication, B. set
off on another journey to the East, but died sud-
denly at Aleppo on the 30th of August 1818. The
Pacha of Damascus seized his papers, so that his
second enterprise has been without results for
Europe.

BAEL or BHEL. See Aegle.

BAENA, a town in the province of Cordova, Spain,
of about 12,000 inhabitants. It is situated about 24
miles south-south-east from Cordova, on the river
Marbella, and carries on a considerable export and
inland trade, chiefly in grain and oil. B. was a
Roman town; and a Roman sepulchre was dis-
covered here in 1833.

BAER, Karl Ernst Von, a distinguished Rus-
sian naturalist, was born February 17, 1792, in
Esthonia. During 1810–1814, he studied medicine
at the university of Dorpat, but convinced that
Russia as it then was presented very few advan-
tages for the acquisition of scientific knowledge,
he went to Germany in 1814, where he studied com-
parative anatomy under Dollinger in Würzburg.
He also made the acquaintance of Professor Nees of
Esenbeck, who exercised a considerable influence
over him. In 1817, he went to Konigsberg, where,
two years after, he was appointed professor of
zoology, and charged with the organisation of the
zoological museum. In 1834, he was called to St
Petersburg, where he continues to be one of the
most important members of the Academy, and
has obtained several honorary distinctions. As a
naturalist, he has specially occupied himself with
the difficult subject of embryology; and to his
laborious investigations we owe several most valu-
able discoveries in regard to the development of
organic bodies. Beginning with his *Epistola de
Ovi Mammalium et Hominis Genesi* (Leip. 1827),
he still further elucidated this subject in his
History of Animal Development (Königsberg, 1828
1837) and *History of the Development of Fishes*
(Leip. 1835). After his return to St Petersburg,
he made the polar regions the objects of his
study. Setting out (1837), by order of the czar,
from St Petersburg on his voyage of exploration,
he examined carefully the northern shores of Russia,
and published a minute description of these and of
their peculiar animals and plants. In 1856 appeared
his *Reflections on the Russian Empire and the Neigh-
bouring Countries of Asia*. In 1864, the fiftieth year
of his doctorate was celebrated by the Esthonian
nobility, at whose expense a splendid volume was
published, containing B.'s autobiography.

BAEZA, a handsome old town of Spain, in the
province of Jaen, from the capital city of which it
is about 22 miles distant in a north-east direction.
Pop. about 12,000. It was here that the younger
Scipio routed Asdrubal with immense loss, taking
10,000 Spaniards prisoners. It was a flourishing city
under the Moors, several of whose caliphs and
kings resided here, but it never fairly recovered its
sack by St Ferdinand in the 13th c. Gaspar
Becerra, the celebrated sculptor, was born here in
1720; but B. is chiefly proud of being the birthplace

of the 11,000 virgins, usually named of Cologne. Its principal buildings are the university, the old monastery of St Philip de Neri, the cathedral, and the Jesuits' college. B. has manufactures of leather.

BA'FFA, the *Paphos* of ancient times, a seaport town on the south-west coast of the island of Cyprus. It has now fallen much into decay, and has but a small population, who trade in cotton, silk, and grain; but under the Venetian rule, it was a place of considerable importance. The present town occupies the site of New Paphos, which, under the Romans, was a beautiful city, full of fine temples and other public buildings. The Old Paphos, famous as the place where Venus landed immediately after her birth from the foam, and as her favourite residence, stood a little to the south-east. A hundred altars were here erected to her name, to which numerous worshippers, male and female, from New Paphos, trooped annually to pay their devotions. An earthquake in the time of Augustus destroyed the Roman Paphos, but it was rebuilt soon afterwards. The Roman deputy-governor, Sergius Paulus, was here converted by St Paul.

BA'FFIN'S BAY, a gulf, or rather sea, on the north-east coast of North America, extending between that continent and Greenland. Lat. 68° to 78° N., and long. 51° to 80° E. It is about 800 miles long, with an average breadth of 280. Its greatest depth is 6890 feet. The tides do not rise more than 10 feet. The currents are generally towards the south, though recent investigations would seem to shew that on the east side of Davis' Strait and B. B. a current from Spitzbergen flows northwards round Cape Farewell. The shores are for the most part lofty and precipitous, backed by ranges of snow-clad mountains. The prevailing rocks are granite and gneiss; the principal animals inhabiting the coasts are, on land, bears, black foxes, and hares; in the sea, the black whale, walrus, and seal, gulls, ducks, and other sea-fowls. The south shore of Whale Sound on the east coast in lat. 77° 20′ N. was found by Captain Inglefield in 1852 to be inhabited. There are Danish settlements on Disco and Whale Islands. B. B. communicates with the Atlantic Ocean by Davis' Strait; and with the Arctic Ocean by Smith Sound on the north, and Lancaster Sound on the west. Wellington Strait, which forms the north-west outlet of Lancaster Sound, was entered in 1852 by Sir E. Belcher. B. B. was first explored in 1616 by William Baffin, after whom it was called, and who was pilot of the expedition, which was commanded by Bylot. Baffin's title to this honour seems to have been most faithfully earned; and the accuracy of his observations and descriptions has been confirmed by subsequent navigators. Whale and seal fishing are prosecuted to a large extent in B. B., which, on account of ice, is only navigable for some two months in summer.

BAGASSE, CA'NE-STRAW, or **CA'NE-TRASH**, is the refuse matter obtained during the expression of the saccharine juice from the sugar-cane. In the manufacture of sugar (q. v.), the sugar-canes, in lengths of 3 to 4 feet, are passed between heavy rollers, which only partly squeeze out the juice, and yield the bruised canes, or B., still retaining a large percentage (usually about 18) of sugar.—The only use to which the B. is put is as fuel in the heating of the boilers and pans in the sugar-manufactory. The improved apparatus introduced of late years has done much to save the large amount of sugar wasted in the B. and in other parts of the process, which at one time amounted to not less than one-half of the entire quantity of sugar in the sugar-cane.

BAGATE'LLE (Fr. signifying primarily any trifle), the name of a game somewhat resembling billiards. A bagatelle-table is usually about 7 feet long and 21 inches broad; it is lined with cloth, and a game is performed on it with balls and a cue or mace. The balls are small ivory spheres, and the sport consists in striking one or more into holes at one end of the board. To perform this and other feats, some skill and experience are required, and the sport is far from unamusing in a cheerful parlour circle. Of late years, bagatelle-tables have become very common in the houses of the middle classes of society; they possess the recommendation of being purchasable at a small expense.

BAGDA'D, the name of a town and pachalic in the south-east of Asiatic Turkey. The pachalic extends from lat. 30° to 38° N., and from long. 40° to 48° E.; and is bounded on the N. by the pachalics of Diarbekir and Van; on the W. and S., by Syria and Arabia; and on the E., by Persia; while at its south-east extremity lies the Persian Gulf. Extreme length, 550 miles; breadth, 350. Pop. 2,000,000. It is watered by the rivers Euphrates and Tigris, which unite their streams at the town of Kurna, in lat. 31° N., and long. 47° E. The pachalic of B. is usually divided into three parts. 1. That east of the Tigris, comprehending the districts of *Khuzistan* (anciently, *Susiana*) and *Kurdistan* (part of ancient Assyria), the former of which is rich in grain and fruit. 2. That west of the Euphrates, a sterile waste, losing itself at last in the great Syro-Arabian desert. 3. That between the two rivers, the northern portion of which is known under the name of *Algezirah*, or 'the Island' (anciently, *Mesopotamia*), and the southern under that of *Irak-Arabi* (anciently, *Babylonia* and *Chaldea*). The last of these divisions, though now a barren wilderness, was in ancient times luxuriantly fertile, the seat of mighty empires, and inhabited by industrious populations. The barbarous misgovernment and wretched incapacity of the Turks have reduced it to its present condition. The pachalic produces, in the better-cultivated districts, crops of rice, wheat, maize, barley, with some hemp, flax, tobacco, &c., while dates are brought to great perfection. The chief wild animals are lions — not numerous — hyænas, jackals, wolves, gazelles, ostriches; the chief domestic ones are horses, asses, mules, buffaloes, camels, and dromedaries. The inhabitants are composed of Turkomans, Armenians, Turks, Jews, Arabs, and Kurds; the last two of which races are notorious for their open and audacious depredations, their mutual wars, and their utter contempt for the authority attempted to be exercised over them. Principal cities—Bagdad, Bassora, and Mosul. For a description of the cities which in ancient times adorned this region, see ASSYRIA, BABYLON, NINEVEH, CTESIPHON, SELEUCIA, &c.

BAGDA'D, the capital of the pachalic of the same name, is situated on both banks of the Tigris, in lat. 33° 20′ N., and long. 44° 23′ E. Pop. estimated at 40,000. The city is surrounded by a brick-wall, 5 miles in circumference; the two parts are connected by a bridge of boats, and the communication is guarded by a citadel. It has an extremely picturesque appearance from the outside, being encircled and interspersed with groves of date-trees, through which one may catch the gleam of domes and minarets; but it does not improve on closer inspection. The streets are narrow, crooked, unpaved, and dirty, full of ruts, and strewed with dead carcasses, which, however, are for the most part removed by dogs, the only public scavengers in the east. The exterior of the

dual houses corresponds with the repulsive
of the streets. They have, in general, no
ws towards the front, and are built of old
; but their interior is often very gorgeously
ted. The vaulted ceilings, rich mouldings,
mirrors, and massive gilding, bring back to
collection of the traveller 'the golden time
d Harun Al-Raschid.' B. contains upwards
ques. These, together with the khans,
, and the palace of the governor, are the
oticeable buildings in the city. The domes
narets are said to be finer than those of
antinople, and are beautifully painted. The
s exhibit the produce of both Turkish and
can markets; but commerce has greatly
sed since Persia began to trade with Europe
y of Trebizonde on the north, and by the
n Gulf on the south. Nevertheless, though no
the chief emporium of merchandise between
and West Asia, as in the middle ages of
can history, and though Kurds and Arabs lurk
the roads that lead from the city to waylay
b travellers and caravans, B. still carries on a
erable traffic with Aleppo and Damascus, and
anufactures of red and yellow leather, silks,
otton-stuffs. Of the 40,000 inhabitants, the
r part are Turks and Arabs; the remainder
ws, Armenians, Hindus, Afghans, and Persians.
mmer, the heat is oppressive; rain does not
more than twenty or thirty days throughout
hole year; but when the snows melt on the
sian hills, the Tigris becomes a majestic, and
a destructive river. In 1831, an inundation
ved one half of the town, and several thou-
lives. The plague visits it periodically once
ten years. In 1831, 4000 people perished
for several days from its ravages! B. is
ntly chosen by Mohammedans of the Shiah
as a permanent place of residence. Several
ers now ply on the Tigris to and from B.; and
is one of the chief stations of the Anglo-
telegraph.

ras founded by the Abbaside calif Almansur,
766 A.D. It was built out of the ruins of
hon and Seleucia. In the 9th c., it was
y enlarged by Harun Al-Raschid, who erected
ous edifices on the east side of the Tigris, and
cted its two banks by a bridge of boats. The
, built for himself, and the tomb of his
ite wife, Zobeide, are said to have been of
rdinary splendour. A hundred years later,
s ravaged by the Turks. In 1253, the grand-
f Genghis Khan, Hulaku, put an end to the
alifate; but the descendants of this Tatar
eror were expelled by Timur, who took the
1393. After several vicissitudes, it remained
e possession of a Turkoman chief, whose
ty governed until 1470. In the beginning of
6th c., Shah Ismael, the founder of the Suffide
ty in Persia, made himself master of it; since
period it has repeatedly been a bone of
ntion between Turks and Persians. After a
rably obstinate siege, it was conquered by
ltan, Murad IV., in 1638. Nadir Shah vainly
ed to retake it in the 18th c., and ever since
been under the sway of the Porte.

'GGAGE, in the marching arrangements of
British army, is placed under strict rules, in
that the accumulation of weight may not
e the movement of the troops; and rules
analogous kind are enforced in troop-ships,
soldiers are on a voyage. The term itself is
to apply chiefly to articles of clothing, and to
personal effects. A private soldier is allowed
rry nothing except that which his knapsack
ther accoutrements can hold; but those who
are married with their officers' consent—a small
number in every regiment—are allowed one small
chest each of definite size, which may be carried on
a march, but at the men's own expense. Staff-
sergeants and pay-sergeants have similar permis-
sion. The B.-wagons are not expected to receive
packages weighing more than 400 lbs. each, or as
much as four men can lift. Officers' B. is, of course,
much more considerable in amount than that of
the non-commissioned officers and privates. On
board troop-ships, the weight to be carried for each
person is strictly defined—from 18 cwt. for a field-
officer, down to 1 cwt. for a married private soldier,
with his wife and children. In encampments,
whether permanent or temporary, and in armies on
field-service, the utmost care is taken to preserve
the B. from the enemy, by surrounding it as much
as possible with defensive troops.

BA'GGESEN, JENS, a well-known Danish poet,
but who also has a place in German literature, was
born at Korsör, in the island of Zealand, February
15, 1764. He first obtained a reputation by his
Comic Tales (1785), the opera *Holger Danske* (1790),
as well as by his odes and songs. Through the kind
assistance of the Prince of Augustenburg, he was
enabled, in 1789, to make a tour through Germany,
Switzerland, and France. In 1811, he was appointed
professor of Danish language and literature at Kiel;
in 1814, he removed to Copenhagen, where he
became involved in an unseemly strife with Ohlen-
schläger, and in 1820 he left his native country
altogether. Some years later, a home-sickness
seized him, and he set out on his return, but died
at Hamburg, October 3, 1826. B.'s nature was a
curious compound of pride and humility, love and
hate, sensitiveness and reflective power, free-think-
ing and faith; and these conflicting qualities also
appear in his poems, which possess an unfinished
and inharmonious character. In 1803 appeared at
Hamburg a collection of his German poems; in
1806, he published an idyllic epic, entitled *Par-
thenais oder Alpenreise*, in twelve cantos, and
written in hexameters, which greatly increased his
reputation. It contains single passages of great
beauty. B. possessed no lyrical talent, in spite of
his warm-hearted and enthusiastic character. Only
a very few of his songs exhibit that simplicity and
tenderness which are the essential requisites of song-
writing; and, besides, they are almost all destitute
of originality. Klopstock was the model whom
he had in view in the composition of his odes; but
he was far from reaching the level of his master.
The sphere in which he shone most conspicuously
was the semi-comic. His 'humorous epic' (as he
called it) of *Adam und Eve*, published shortly after
his death, is a singular mixture of humour, pathos,
levity, and earnestness. He left in manuscript a
poem of a similar character on the subject of
Faust. His *Poetical Works in the German Lan-
guage* (Leip. 1836, 5 vols) have been published by
his son, who has prefixed to them an excellent
biography.

BAGLIVI, GEORGE, a celebrated Italian physi-
cian, born at Ragusa in September 1669. The inci-
dents of his life are almost entirely confined to his
professional career. Originally descended from an
Armenian family, he took the name of his adoptive
father, who was a wealthy physician of Lucca, and
who bestowed on him an excellent education. He
studied at Salerno, Padua, and Bologna, and after-
wards visited the principal hospitals of Italy. In
1692 he went to Rome, where he enjoyed the ana-
tomical prelections of his friend Malpighi. Shortly
after, he was appointed professor of anatomy at the
college of La Sapienza, Rome, where he died in

to be so prodigal and ostentatious that, at his death, in 1626, his debts amounted to upwards of £22,000. The immediate occasion of his death (as related by Aubrey, who probably got it from Hobbes, who was B.'s intimate friend) was cold caught in making an experiment to test the power of snow to preserve flesh. He died in the house of the Earl of Arundel, to which he had been removed with the fatal chill upon him which he had caught in the course of the experiment.

While, on the whole, the public life of Lord B. is marked by meanness and dishonour, his literary and scientific works are everywhere irradiated by the powerful light of an intellect which towered over those of other men. The first edition of his *Essays* appeared in 1597; his two books of the *Advancement of Learning* in 1605; his *Wisdom of the Ancients*—in Latin—in 1610; a third edition of his *Essays*, greatly extended, in 1612; his two books of the *Norum Organum*, or second part of the *Instauratio Magna*, designed to consist of six parts—also in Latin—in 1620; his *History of the Reign of Henry VII.*, in 1622; his nine books, *De Augmentis Scientiarum*—a Latin translation and extension of his *Advancement of Learning*—in 1623. Besides these, he wrote several minor works, which need not here be specially mentioned. It is enough to say that his writings embrace almost all subjects, from jurisprudence—which he treated not as a mere lawyer, but as a legislator and philosopher—to morality and medicine. The *Sermones Fideles* is a treasury of the deepest knowledge of human relations, conveyed in a gorgeous and energetic style. Almost the only science with which he was unacquainted was that of mathematics. Thus singularly gifted and accomplished, he appeared at a time when science, from a variety of causes, started on that progress which has never since been arrested. If it is now a question how far he contributed by his genius to that progress at its commencement, it is a fact that he was long vulgarly regarded by his countrymen as the father of Inductive Philosophy—as having been the inventor and first teacher of the method of interrogating nature by observation and experiment and inductive reasoning. Nor are his writings wanting in materials qualified *ex facie* to support his title to that eminence. His claim to the distinction, however, has of late been the subject of much controversy, the result of which is that it has been generally disallowed. But if it be true that he had a somewhat vague and imperfect apprehension of the philosophy of induction, overestimated the province of observation, and undervalued the use of deduction and hypothesis, and that even his classification of the sciences in the *De Augmentis*, on which his reputation long turned, has been properly superseded by the superior and better-reasoned classification of M. Comte; still it must be borne in mind that he was one of the first that was aware of the true character of the positive philosophy, and who understood its conditions, and foresaw its final supremacy; and as for his classification, that it was a marvellous effort of reason at a time when the sciences were in their infancy, and many of them were yet unborn. Also, it must be said, that if B. cannot be claimed by the physicists as the father of their science, and they must look rather to Galileo, yet he may fairly be claimed in that character by the students of man and society; for he was the first to aim at the extension of the methods of positive philosophy to moral and social conceptions. If recent criticisms have dethroned him from the position which for centuries he occupied in relation to the physical sciences, by showing that neither his doctrines, experiments, nor writings have materially affected their course, it is only to leave him free to be placed in a position no less dignified in relation to human and social philosophy.

As a writer, B. presents us in combination an intellect at once one of the most capacious and profound that ever appeared among men—one of the most penetrating, one of the most far-reaching—and an imagination almost equally remarkable. In no other writer is so much profound thought to be found expressed in such splendid eloquence. 'If,' says Hallam (*Literature of Europe*, iii. 218), 'we compare what may be found in the sixth, seventh, and eighth books *De Augmentis*, in the *Essays*, the *History of Henry VII.*, and the various short treatises contained in his works on moral and political wisdom and on human nature, from experience of which all such wisdom is drawn, with the Rhetoric, Ethics, and Politics of Aristotle, or with the historians most celebrated for their deep insight into civil society and human character—with Thucydides, Tacitus, Philip de Comines, Machiavel, Davila, Hume—we shall, I think, find that one man may almost be compared with all of these together.'

The collected works and life of Lord B. were published by Mallet in 5 vols. (Lond. 1765); a good edition is that of Montague (16 vols., Lond. 1825–1834); but the best, it is generally admitted, is the last (5 vols., edited by Messrs Spedding, Ellis, and Heath, Lond. 1858). Montague's edition gave occasion to an able review of B.'s character by Lord Macaulay, to be found among his *Essays*. The *Encyclopædias Britannica* and *Metropolitana* contain valuable papers on his writings, on which also Sir John Herschel's *Preliminary Discourse* to *Lardner's Encyclopædia* may be consulted.

BA'CON, Roger, an English monk, who, through the force of his intellect, raised himself far above his age, made wonderful discoveries in several sciences, and contributed much to extend the then scanty knowledge of nature. He was descended of a respectable family, and born at Ilchester, in the county of Somerset, 1214. He studied at Oxford, and then at Paris, where he received the degree of Doctor in theology; and soon after his return home, he entered the order of the Franciscans, and settled at Oxford. Physics seems to have been at that time the chief object of his labours; and liberal friends of science supplied him with the means of pursuing his researches. In exploring the secrets of nature, he made discoveries and invented applications which were looked upon by the ignorant as the work of he[illegible]. This prejudice was encouraged by [illegible] and hate with which his brother [illegible] his superiority. Besides, he loudly [illegible] ignorance and immorality of the clergy, of the monks, and even wrote a letter pope, in which he represented to him the [illegible] of clerical reform. Out of revenge, an [illegible] was brought against him at the papal co[illegible] the pope interdicted him from [illegible] university. He was shortly [illegible] forbidden all human intercourse, sufficient food. Among the few who admired Bacon's genius, [illegible] times, was the cardinal-bishop, [illegible] time papal legate in E[illegible]nd. [illegible] Bacon's writings, but th[illegible] ciscans prevented a co[illegible] his ascent to the papa[illegible] wrote to him, expressing [illegible] with whatever he d[illegible] repeated his request to [illegible] the Franciscan prohibition[illegible] up his *Opus Majus* (edited by [illegible] sent, along with two other w[illegible]

pope, by his favourite pupil, John of London, and in which he represented the necessity of a reformation in the sciences through a diligent study of the languages and of nature. How Clement received them is not very well known; but they could only have reached him about the time he was seized with his last illness. For ten years after Clement's death, B. was free from open persecution at least. But in 1278, under Nicolas III., the general of the Franciscan order, Jerome of Esculo, declared himself against B., forbade the reading of his books, and issued an order for his imprisonment, which was sanctioned by the pope. This new imprisonment lasted ten years. When Jerome of Esculo became pope, under the name of Nicolas IV., B. sent him a *Treatise on the Means of warding off the Infirmities of Old Age* (Lat. Oxf. 1590; Eng., by Brown, 1683), with a view to convince him of the harmlessness and utility of his labours, but in vain. What the pope refused to the representations of the old philosopher, was yielded to the intercession of several influential English noblemen, and B. at last recovered his freedom. He returned to Oxford, wrote a compendium of theology, and shortly after died—according to some, in 1292, to others, in 1294.

B., although an extraordinary genius, could not rid himself of all the prejudices of his times. He believed in the philosopher's stone and in astrology. His chief invention is the magnifying-glass. There are also in his writings other new and ingenious views on optics; for example, on refraction, on the apparent magnitude of objects, on the great increase in the size of the sun and moon in the horizon. On other subjects, again, he fell into the greatest errors. He made several chemical discoveries which were wonders at that time. He knew, for instance, that with sulphur, saltpetre, and charcoal, we may imitate lightning, and produce explosions. Mathematics, applied to observation, he considered to be the only means of arriving at a knowledge of nature. He studied several languages, and wrote Latin with great elegance and clearness. Deserving of honourable mention are his discoveries of the errors that prevailed in the calendar, and his proposals and data for remedying them, in which he came very near the truth. He prepared a rectified calendar, of which a copy is preserved in the Oxford library. On account of his extensive knowledge, he received the name of 'Doctor mirabilis.' Several of his works have never been printed, and are preserved among the Cottonian manuscripts in the British Museum; some are to be found in French libraries.

BA'CON, John, a distinguished statuary, was born in London, 1740, and died there August 7, 1799. He was at first a painter on porcelain, and only began to work in marble at the age of 23; yet in 1769 he received the first prize from the Royal Academy, of which he was soon after made a member. His statue of Mars first established his fame. Among his principal works are, two busts of George III., one in Christ Church College at Oxford, the other in the university library at Göttingen; the monuments of Lord Chatham in Westminster Abbey and in Guildhall; the statues of Howard and of Samuel Johnson in St Paul's, and that of Blackstone at Oxford. B. was deficient in imagination, and had no refined perception of beauty.

BACSA'NYI, Janos (pronounced Bat-shan-yi), a Hungarian writer and poet, was born May 11, 1763, at Tapolcan, in the circle of Szalader. After studying at Vesprim, Oedenburg, and Pesth, he became tutor to the son of General Orczy, and while thus employed, published his first work, *The Valour of the Magyars* (Pesth, 1785). He received the same year an appointment in the finance department at Kaschau, and there, in conjunction with Baroti and Pazinczy, he began the *Magyar Museum* (Kaschau and Pesth, 1788–1792). In 1793, in consequence of a liberal poem, he was deprived of his office, and in 1794, having taken part in the conspiracy of Bishop Martinovich, he was carried to Spielberg, where he was confined till 1796. After recovering his freedom, he assisted in editing the *Magyar Minerva*, then came to Vienna, where he held an office in the bank, and married (1805) the German poetess, Gabrielle Baumgarten—an unhappy match. When the French entered Vienna in 1809, B. translated Napoleon's proclamation to the Hungarians, on which account he found himself afterwards obliged to take refuge in Paris. After the peace of Paris, he was given up, and had Linz assigned him as a compulsory residence, but was allowed to receive his French pension till his death. He died at Linz, May 12, 1845: the Hungarian Academy had in 1843 again elected the octogenarian a corresponding member. In the latter part of his life, B., besides other works, published his *Collected Poems* (Pesth, 1827; Ofen, 1835). We are also indebted to him for the collected edition of the poetical works of Anyos (Vienna, 1798) and of Faludi (Pesth, 1824).

BA'CTRIA, the ancient name of the imperfectly known land lying between the western part of the Hindu Kush mountains, and the river Oxus (Amu, or Gihon), which separated it from Sogdiana on the north and north-east. Its boundaries in early times cannot be precisely ascertained, but it is generally considered to have been identical with the modern Balkh (q. v.). B. is supposed to have been the seat of the parent-people from which the Aryan (q. v.) or Indo-European family of nations branched off. The ancient Bactrians of historic times were akin to the Medes and Persians, and used the Zend language. B. was originally the centre of a powerful kingdom, which extended itself over the east of Persia, but we have almost no record of its early greatness; we only know that Ninus, the Assyrian king, in spite of his vast army, found much difficulty in conquering it, and that when Arbaces besieged the last Assyrian king, Sardanapalus, in his metropolis, he was assisted by a large force of Bactrians. It is believed that the ancient Persian religion was first developed in Bactra or Zariaspa, the capital of B., which was the head-quarters of the Magi till the land was overrun by the Arabs, and a centre-point of the inland trade of Asia. The modern town of Balkh (q. v.) is built upon its site. Alexander, on his return from Persia, left in B. a colony of 14,000 Greeks, who here extended civilisation. After the death of Alexander, B. was annexed to the kingdom of Syria; but was raised to independence by its governor, Diodotus I., who founded the Greek kingdom of New B. about 256 B.C. The history of this kingdom was formerly little known, but has been recently elucidated by numerous Graeco-Bactrian coins found in the *topes* or burial-places of Afghanistan. These coins give the names of a series of kings, and bear indications of the political circumstances of the Greek kingdom of B. On those of Eucratides, a monarch who flourished in the age of Mithridates, there are found, beside the Greek characters, others which have been proved to belong to a dialect of the Sanscrit, and have been very happily deciphered by Mr Prinsep.

BA'CTRIS, a genus of Palms, of which nearly fifty species are known, all American. The leaves of some are pinnate, those of others entire. They are generally small palms, some of them very small, and with slender stems; that of *B. tenuis* is not thicker than a goose-quill. Some are spiny, and form thickets not easily traversed. *B. acanthocarpa*

turnips, &c., have been introduced from Europe, and succeed well. Of indigenous productions, the most considerable are rice, pulse, sugar, cotton, indigo, and tobacco. The district is largely engaged in the manufacturing of muslins, silks, carpets, blankets, tents, tapes, threads, ropes, paper, glass, cutlery, jewellery, leather, ink, soap, and pottery. Ardent spirits, too, are extensively distilled from the flowers of the *Bassia latifolia* (q. v.). Before the days even of Moslem domination, B. appears to have been the centre of a Hindu empire, which native accounts describe as of matchless splendour, and of fabulous duration.

BAHI'A, capital of the Brazilian province of the same name. It is otherwise called San Salvador—the more usual term being taken from *Bahia de Todos-os-Santos*, or *Bay of All Saints*, on which it is situated, in lat. 13° 1′ S., and long. 38° 32′ W. B. contains over 200,000 inhabitants, pretty equally divided between whites, blacks, and mulattoes. The number of vessels entering the port of B. in 1871 was 878, with a tonnage of 430,354, while the number clearing out was 868, with a tonnage of 442,308. The shipping trade for the last two or three years has been on the decline. The value of imports of foreign goods into B., in 1871, was £1,941,727; and the value of exports in the same year, £2,081,248. The chief exports of B. are sugar, cotton, coffee, tobacco, rice, rum, dye-stuffs, fancy woods, cocoa-nuts, horns, hides, and bullion; and it imports manufactured goods, provisions, flour, salt, iron, glass, and wines. B. is the oldest city in Brazil, having been founded by the first captain-general of the country, and was for a long time the capital of the whole colony. As a port, B. is unrivalled.

BAHI'A, a province of Brazil, about the middle of the coast, taking its name from its chief city. It extends in S. lat. from 10° to 16°, and in W. long. from 37° to 44°. Pop. in 1867 was 1,500,000. The wealth of B., consisting in valuable timber, in rich mines of gold, silver, copper, lead, iron, in deposits of potash, alum, &c., is in great measure lost for want of good roads. The interior contains lofty sierras; but the maritime districts are fertile, being well watered by the Itapicuru, Contas, and other rivers. Besides the streams that flow through B., the San Francisco, a vastly larger river, forms about half of the inland boundary, dividing this province from that of Pernambuco.

BAHI'A HO'NDA, a harbour on the north coast of Cuba, 60 miles west-south-west of Havana, protected by a fort, and much resorted to by privateers and slavers.

BAHNA'SA, or BEHNE'SEH, a town of Central Egypt, on the Bahr Yousef (Joseph's Canal). It is noteworthy as the site of the ancient *Oxyrynchus*, celebrated for its numerous monasteries, the ruins of which are still to be seen.

BAHR, an Arabic word signifying a large body of water, is applied both to lakes and rivers.—BAHR-EL-ABIAD (the White River), and BAHR-EL-AZRAK (the Blue River), are the chief branches of the Nile (q. v.).—BAHR-ASSAL is Lake Assal (q. v.).—BAHR-BELA-MA (the Sea without Water), a long, deep valley in the desert, west from Cairo. It is completely barren, but has the appearance of having been once a water-course.

BAHR, JOH. CHRISTIAN FELIX, an eminent German philologer and critic, was born, 1798, at Darmstadt. He was educated at the Heidelberg gymnasium and university, where he gained the favour and friendship of Creuzer, whose symbolic system of interpretation in mythological matters he himself pursued at a later period. He was elected a professor in 1826. Previous to this, he had occupied himself chiefly with the elucidation and criticism of Plutarch, the result of which was an annotated edition of *Alcibiades* (Heid. 1822), and of *Philopoemen*, *Flaminius*, *Pyrrhus* (Leip. 1826). At the same time, he collected and published the fragments of Ctesias. But a greater interest was excited by his *History of Roman Literature* (1828), which is noted for its clearness and comprehensiveness. Three supplements to this work also appeared: *The Christian Poets and Historians of Rome* (1836), *The Christian-Roman Theology* (1837), and the *History of Roman Literature in the Carlovingian Period* (1840). One of his most important works is his version of Herodotus (1832—1835). In 1835, he published his *De Universitate Constantinopoli Quinto Sæculo Conditâ*. He likewise contributed numerous articles to Jahn's *Jahrbücher für Philologie*, and other works. He died 27th November 1872.

BAHRDT, KARL FRIEDRICH, a German theologian of the extreme sceptical school, was born, 1741, at Bischofswerda, in Saxony, and studied at Leipsic, where he soon displayed extraordinary talents, and some restlessness of disposition. His early theological writings betrayed the sceptical tendencies which were afterwards more fully developed. On account of his immoral conduct, however, he was, in 1768, compelled to leave Leipsic, where he had been a popular preacher. In Erfurt, his next residence, he was appointed professor of Philosophy and Hebrew Antiquities, and wrote *Letters on a Systematic Theology*, and *Aspirations of a Mute Patriot*, two works whose heterodoxy involved him in controversies, and made his position untenable. In 1771, he went to Giessen, where he delivered theological lectures, and preached with approbation. His translation of the New Testament was regarded as so dangerous, that the author was deprived of the privilege of teaching. His creed, in fact, was simple Deism, and one of the chief points in his theology was his rejection of miracles. Even the immortality of the soul was not positively maintained in his works. Ultimately, after attempting to establish various institutions, he was reduced to the position of a tavern-keeper; and as he still persevered in his attacks on orthodoxy, he was imprisoned for one year at Magdeburg, where he wrote an autobiography. Among his others works are—*The Religious Edict* (a satire on the Prussian religious edict of 1788), and *The German Union*. He died at Halle, April 23, 1792.

BAHREI'N ISLANDS, or AVÂL ISLANDS, a group of islands lying in the Persian Gulf. The most important of these is Bahrein, or Avál, about 27 miles long, and 10 broad. It is hilly in the centre, but the soil generally is fertile, and produces dates, figs, and other eastern fruit, besides wheat and barley. Bahrein is badly cultivated. Spring-water is plentiful in the interior, but on the coast it can only be procured from the bottom of the sea, where it springs up quite fresh, and is brought up by divers in skins. Manama, the capital, in lat. 26° 12′ N., and long. 50° 39′ E., has a good harbour on the north, but a safer though smaller one on the south. The B. I. are chiefly remarkable for their pearl-fisheries, which were known in ancient times, and which employ, during the season, from 2000 to 3000 boats, each manned with from 8 to 20 men. The annual value of the pearls is estimated at from £200,000 to £300,000. Tortoise-shell, shark-fins, and dates are also articles of export. The islands, which have been subject to a good many political changes, are now inhabited by Arabs. Pop. 60,000.

BAI'Æ, a small town of antiquity, on the coast of Campania, 10 miles west of Naples, where the

present castle of Baja stands. When the Roman empire was in its greatest splendour, the beauty of its situation, the fineness of the surrounding scenery, and the excellence of its mineral springs, made B. such a favourite resort of the Roman nobles, that for want of space for their baths and villas they encroached on the sea. Julius Cæsar, Piso, Pompey, Marius, Julia Mammæa, and others, had country-houses at Baiæ. Horace preferred B. to all other places in the world. Seneca warned every one who desired to maintain dominion over his passions, to avoid this watering-place. Cicero thought it necessary to excuse himself for undertaking the defence of Marcus Cœlius, a man who had often visited B., for B. was considered by the stricter moralists of those times as the abode of voluptuousness and luxury, and a den of vice. The ruins, still standing on the desolate coast, or rising from the sea, are now the only evidence of the former magnificence of B., whose population, dwelling in mean hovels, only amounts to 800. The ruins of three supposed temples—one of Venus, one of Mercury, and one of Diana Lucifera—as well as the remains of a few *thermæ*, or warm baths, still attract the attention of archæologists. The harbour, one of the largest belonging to the Romans, is now much destroyed. The surrounding country is covered with the ruins of Roman villas, sepulchral monuments, and other buildings.

BAIKAL (in Turkish, Bei-kul, i.e., Rich Lake) is, after the Caspian Sea and the Sea of Aral, the largest lake of Asia. It is a fresh-water lake, and is situated in the south of Siberia, in the gov. of Irkutsk, near the great military road between Moscow, Kiachta, and the mines of Nertschinsk. Lat. 51° 20′ to 55° 30′ N., long. 103° to 110° E. It somewhat resembles a sickle in shape, and varies considerably in breadth. Between the mouths of the Selenga and the Buguldeicha, it is only 19 miles across. Its length is 370 miles, and its breadth 20 to 70 miles; height above the sea, 1363 feet; depth in centre very great. The Baikal Mountains, a spur of the Altai, enclose the lake, which is fed by numerous streams, the chief of which are the Selenga and Barguzin. Its outlet is by the Lower Angara, a chief tributary of the Yenisei; but the river is inconsiderable in size compared with those which flow into the lake. It has several islands, the largest of which, Olkon, has a length of 30 miles. B., which forms an important link in the chain of communication between Russia and China, has two commercial ports, and of recent years, steam-boats have given a considerable impetus to its trade. Its sturgeon and seal fisheries are valuable, and large quantities of a fish resembling a herring are also caught in it. A peculiar fish, called the golomynka (*Callionymus Baicalensis*), which is almost one mass of fat, yielding beautiful train-oil, was at one time caught in immense numbers, but it is now much scarcer. The surface of the lake is frozen from November to April, but the traffic is carried on over the ice. Besides the Russians settled on the banks of the Selenga and Angara, the shores of Lake B. are also inhabited by tribes of the Burates and Tunguses.

BAIL is a technical term in the practice of the law both in England and Scotland, with this difference, that, in England, it is used both in civil and criminal procedure, whereas in Scotland it is applied exclusively to the latter. By B. is understood the security given by sufficient sureties for the appearance in court on a day, and at a place certain, of a person arrested or imprisoned, and who, in consequence of such security or B., is in the meantime set at liberty. Such security, however, involves the assumption of the custody of the arrested or imprisoned party by his B., the meaning of the rule being that the party arrested or imprisoned is delivered into the hands of those who bind themselves for his forthcoming, in order that he may be protected from prison until he has to make his personal appearance; and, in this sense, it differed from the old term, *mainprize*, now obsolete, and which signified a mere security without any other or corresponding guarantee, as in the case of bail. A technical and necessary distinction is taken in law-books between what is called *common B.*, or *B. to render to prison*, and *special B.*, or *B. to the action*; but for general information, the following statement of the law may suffice.

In civil process, the sureties give their bail-bond to the sheriff himself for the appearance of the defendant, according to the exigency of the case, and for nothing else. It does not appear that any particular or limited number of sureties is to be taken; but it would seem that the sheriff may insist on more than two, provided they have only sufficient property within the county to answer the penalty; but if more than two be tendered, it is not necessary that each should be worth the full amount. On the other hand, the bail-bond will be good though there be only one surety; but in accepting such security it would seem that the sheriff does so at his own risk. If there is reasonable ground for believing the sureties to be sufficient, the sheriff has no discretion, but is bound to accept the B.; and if he refuses to do so, he is liable to an action.

The necessity of B., however, may be avoided by the defendant availing himself of the provisions of statutes which are re-enactments of older laws, by which it is enacted that the arrested or imprisoned party may obtain his immediate discharge by depositing with the sheriff the sum demanded by the plaintiff, together with £10 towards the cost, the same to remain in court to abide the event of the suit. The enactment, however, contains a proviso that it shall be lawful for a defendant who has made such deposit in payment, at any time in the progress of the cause, before issue joined, or final or interlocutory judgment, to receive out of court the sum so deposited and paid, upon putting in and perfecting special B., and paying such costs as the court shall direct; and, by another enactment of the same statute, provision is made for the case where a defendant who has put in B., afterwards elects to deposit the plaintiff's demand, and to pay the costs to abide the event of the action.

As to those who may or may not be B., it would appear, from the nature of the security undertaken, that persons privileged from arrest cannot be B., because the engagement on the part of the B. being, in default of the principal party, to pay the debt or damages and costs, the plaintiff is entitled to require the security of persons who are amenable to the ordinary process of the courts. Therefore, peers, members of parliament, ambassadors, and other privileged persons, cannot become bail; nor, generally, can attorneys or those employed in executing the process. But persons who are not in such a position, but who are either housekeepers or freeholders, may be taken as bail. The possession of *leasehold* property is not enough, unless the party is also a housekeeper; but the real owner of a *freehold* estate, however small it may be, situated within the jurisdiction of the court, and provided he can otherwise make up the amount required, is qualified, though he be only a lodger, or merely an occupant by sufferance in the house of another. Again, to constitute a 'housekeeper,' within the meaning of

the rule, the house must be within the jurisdiction of the court, and such a party must be the *bond-fide* tenant of the house in his own right, enjoying its benefits, and bearing its burdens. A person, therefore, in lodgings in England, but with a house in Scotland, is not admissible as B.; and such B. must strictly in this sense be a *housekeeper*. Bail has ceased to be usual since imprisonment for debt was abolished.

Besides these arrangements of the common law with regard to B., we may mention two other forms of it—namely, B. *in Error*, and B. *in Attachment*. The former is regulated by the Common Law Procedure Act (1852), 15 and 16 Vict. c. 76, by section 151 of which it is provided that proceedings in error shall not stay or delay execution on a judgment, unless the person alleging or pleading such error shall be bound, along with two sufficient sureties, in double the sum recovered by the judgment, in order to prosecute the proceedings in error with effect, and make payment of the costs, in the event of the judgment being affirmed, or the proceedings in error being discontinued. B. in attachment, again, signifies the sureties required for a party arrested upon a writ of attachment, and brought up before a judge in order to obtain his discharge from custody, the sureties undertaking that he shall appear and answer such interrogatories as may be required of him. This, however, only applies to attachment in the case of *contempt* of court; for it would appear that an attachment for the non-payment of money, or the non-performance of an award, is not bailable. In the Court of Chancery, also, there are rules for accepting B.; as, for instance, for a defendant against whom attachment has issued for his contempt in not making appearance to the plaintiff's suit; but an attachment for non-performance of a decree in Chancery is not a bailable process.

In criminal procedure, the subject of B. is at present regulated by the 11 and 12 Vict. c. 42, which provides that if the justice or justices, before whom a prisoner is brought, shall be of opinion that the evidence against the prisoner be sufficient, or even if it raise a strong or probable presumption of his guilt, they shall either commit him to prison, or admit him to B.—that is, allow him to be discharged on entering into a recognizance—with some sufficient surety or sureties—to appear and surrender himself to custody, to take his trial on such indictment as may be found against him, in respect of the charge in question, at the next assizes or sessions of the peace. The crime of treason, however, is not a bailable offence, except by order of a Secretary of State, or by the Court of Queen's Bench, or by a Judge thereof in vacation. But Justices are bound to admit to B. in all cases of misdemeanour, excepting in the case of a misdemeanour in receiving property stolen or obtained by false pretences, &c., or the case of any misdemeanour for the prosecution of which the costs may be allowed out of the county rate, as to all which misdemeanours, as well as in all felonies—treason excepted—justices and magistrates have a discretionary power either to admit to B. or to commit to prison. The Court of Queen's Bench exercises a paramount jurisdiction, and can bail in all cases whatsoever; but it is not usual for that court or for justices or magistrates to admit to B. in any case of felony, except under circumstances of a special and favourable kind.

In Scotland, the term B., as we have mentioned, is only used in the proceedings in the criminal courts; and there the general distinction is taken between offences that are capital and not capital, the former not being bailable except by order of the High Court of Justiciary, who exercise a power in this respect analogous to the jurisdiction of the Court of Queen's Bench; offences that are not capital being bailable by magistrates, sheriffs, or other competent judges. In the *civil* process of the Scotch courts, the term corresponding to B. is CAUTION (q. v.).

BAIL COURT is the name given to a new and supplementary tribunal at Westminster, called into existence by the 11 Geo. IV. and 1 Will. IV. c. 70, by which, after providing for the appointment of an additional puisne judge in each of the three courts of common law, it is made lawful for any one of the judges of either of these courts, when occasion shall so require, where the other judges of the same court are sitting in banc (see BANC), to sit apart from them for the business of adding and justifying special bail, discharging insolvent debtors, administering oaths, receiving declarations required by statute, hearing and deciding upon matters in motion, and making rules and orders in causes and business depending in the court to which such judge shall belong, in the same manner and with the same force and validity as may be done by the court sitting in banc.

This statute has been hitherto acted on only by the Court of Queen's Bench, wherein one of the judges sits from time to time in the B. C. for the purposes above specified. It may be remarked that a rule of the B. C. cannot be reopened in the full court after the term in which it is made, even though the judge who pronounced it sanctions the application; and a judge sitting apart, under the authority of the statute, has equal authority with the full court to reverse the decision of a judge sitting at chambers. See Lush's *Practice* by Stephen.

censure itself; consequently, in literary journals, *Festus* is frequently mentioned with a contempt which it is far from deserving. It is a wonderful work, when the age of the author at the period of its production is taken into account. It was commenced before the author had reached his 20th year, and completed in three years. *Festus* errs from excess of boldness. Mr B. speaks of universes as other poets speak of butter-cups. He has the *entrée* to the highest heaven and to the regions of penal fire. He is on terms of perfect familiarity with Eternity. He lays his scenes in the 'Centre,' 'Elsewhere,' 'Everywhere,' 'Nowhere.' Despite its extravagance, *Festus* is full of poetical thought and felicitous expression, and has occasional dashes of grim humour in it, not unworthy of Goethe's mocking fiend himself. The faults of the poem are as great as the beauties; there is no congruity or proportion in it, and you lay it down with a sense of admiration qualified with disgust. In 1850, Mr B. published the *Angel World*, which possesses all the faults and all the beauties of the former work on a reduced scale. If the reader's admiration is less, his disgust is less. The *Angel World* is now incorporated with the larger work. Mr B.'s subsequent writings have been the *Mystic*, and the *Age*, a colloquial satire. The first production is in the writer's early style, with all the beauties deleted. But whatever measure of success may attend Mr B. in 'Elsewhere' and 'Nowhere,' complete failure awaits him when he deals with mankind and the ordinary affairs and follies of earth. The *Universal Hymn* was published in 1867.

BAI'LIE, a Scotch term, with several legal applications. It chiefly, however, and popularly, signifies a superior officer or magistrate of a municipal corporation in Scotland, with judicial authority within the city or burgh. In royal burghs, the office is in some respects analogous to that of Alderman in England. The chief magistrate of a Scotch corporation, called the *Provost* (q. v.), and often one or more of the bailies, are, in virtue of their office, in the commission of the peace; and by the 6 Geo. IV. c. 22, bailies are exempted from serving on juries. There are also *Bailies of Regality* and *Barony*, who are appointed by the *Superior* or over-lord of the manor (q. v.), with limited powers fixed by the 20 Geo. II. c. 43. There is a B. for the Sanctuary or Abbey of Holyrood, appointed by the Duke of Hamilton as hereditary keeper, and having jurisdiction within the precincts. See ABBEY, SANCTUARY. The word B. was also formerly a term in the practice of Scotch conveyancing, and signified an officer who represented the seller, and who, as such, gave *seisin* or sasine (q. v.), or delivery of the lands sold to the buyer or his attorney; but by the changes and simplifications effected by recent legislation, the office of B. in this sense may be said to be virtually abolished; indeed, by the 21 and 22 Vict. c. 76, s. 1, called *The Titles to Land Act*, seisin itself, as a separate and independent documentary title, is declared to be unnecessary, and registration of the conveyance of the estate held to be sufficient.

BAI'LIFF in English, BAILIE in Scotch, BAILLI in French, and BALIO in Ital., are terms having a common origin—namely, the middle Latin *ballivus*, which is again connected with the older form, *bagulus*, or *bajulus*. Through all the changes of application they have undergone in the course of history, they have continued to agree in denoting an overseer of some kind—an officer exercising superintendence on behalf of some superior authority. At the Greek imperial court in Constantinople, the chief tutor of the imperial children was called Bajulos. The same title seems also to have been given in Constantinople to the superintendent of the foreign merchants, who was appointed by the Venetians, and it may possibly be for this reason that the title Balio came at length to be applied also to the Venetian ambassadors themselves. The title Ballivus was introduced by the Knights of St John into the south and west of Europe, as the eight members of their chapter were called *Ballivi conventuales*, whence also the name Ballei, given to the circles into which the possessions of the order were divided. In France, the royal Baillis were at one time commanders of the troops, administrators of the royal domains, and judges each in his district. In later times, the royal Baillis were deprived of the two latter offices, and were consequently then called Baillis d'Epée only. Proprietors of estates, also, possessing supreme jurisdiction, appointed Baillis to superintend these courts of justice. As very little knowledge was required for these situations, and as they might be purchased, they were held in little estimation; and in later times, the Baillis became standing characters on the stage, held up to ridicule on account of their ignorance and their absurd pretensions, as well as for cheating and injustice. In England, the name B. was introduced in the reign of William I., to designate the superintendents of counties, which were called Ballivæ.

BAI'LIFF, in English law, is a legal officer, and may be described as the keeper, protector, or superintendent of some duty or charge legally imposed on him. As officers of the law, bailiffs put in force arresting process, and they perform other duties within the county or bailiwick required of them by the sheriff, who is their immediate official superior. In this sense bailiffs are either *bailiffs of hundreds*, or *bound bailiffs*. The duty of the former is to collect fines, summon juries, attend the judges and justices at the assizes and quarter-sessions, and execute writs and processes in the several hundreds. *Bound* bailiffs, again, are officers usually joined by the sheriffs with the bailiffs of hundreds, and employed on account of their adroitness and dexterity. They are called bound bailiffs, because the sheriff, being civilly responsible for their official misdemeanours, they are annually bound in an obligation, with sureties, for the due execution of their office. There are also *special bailiffs*, who are officers appointed by the sheriff on the application of the party suing out the process to be executed; and whenever a party thus chooses his own officers, he is considered to discharge the sheriff from all responsibility for what is done by him. There is, besides, another exceptional class of bailiffs, called bailiffs of *liberties*, honours, manors, and other lordships and franchises, whose appointments, duties, and responsibilities are regulated by the 7 Vict. c. 19. The county courts likewise have bailiffs for the execution of their process, as to whom see 9 and 10 Vict. c. 95, 12 and 13 Vict. c. 101, 13 and 14 Vict. c. 61, and 19 and 20 Vict. c. 108.

The sheriff himself is the *Queen's B.*, and, as such, it is his business to preserve the rights of the Crown within his bailiwick. He must seize to the sovereign's use all lands devolved to the Crown by attainder or escheat; must levy all fines and forfeitures; and must seize and keep all Waifs (q. v.), wrecks, estrays, and the like, unless they be granted to some subject.

BAI'LIFF, HIGH. See HIGH BAILIFF.

BAI'LIWICK legally means the county or district within which the sheriff's bailiffs may execute their office. Blackstone says that this word was introduced by the princes of the Norman line in

imitation of the French, whose territory was divided into bailiwicks, as that of England into counties.

BAILLEUL, a town of France, department of the Nord, with manufactures of woollens, cottons, lace, hats, beet-root, sugar, &c.—the cheese of its neighbourhood being also celebrated. Pop. in 1872, 6348.

BAI'LLIE, JOANNA, a modern poetess of distinguished merit, was born in 1762 at Bothwell, in Lanarkshire, Scotland. Her father was a Presbyterian clergyman. She received a superior education, and soon began to manifest those talents which subsequently excited the admiration of the public. Her career was a singularly happy one, but devoid of all striking incident. At an early period, she went to reside in London, where her brother, Matthew Baillie, had established himself as a physician. Here she remained till her death, which occurred on the 23d of February 1851, when she had attained the venerable age of eighty-nine. No authoress ever enjoyed a larger share of the esteem and affection of her literary contemporaries. All vied in shewing her a courteous respect, and even America sent its votaries to her little shrine at Hampstead. Her greatest achievement is undoubtedly the *Plays on the Passions*, which, though erroneous in conception, are full of noble and impressive poetry, and often characterised by intense dramatic power. The principle upon which Miss B. proceeded in the construction of these works, was to take a single passion as the subject of a play, and to exhibit its influence on an individual supposed to be actuated by nothing else. In point of fact, such persons do not exist in society; men are swayed by a variety of conflicting emotions; and even when any one of these becomes dominant, it does not wholly destroy the rest, otherwise the victim of a ruling passion would lapse into a monomaniac. The leading personages of Miss B.'s plays are, therefore, rather impersonations of certain elements of human nature, than genuine human beings. They are vivid poetical studies in psychology; not mirrors held up to nature, like the brilliant and variegated creations of Shakspeare. Still, there are scenes, in her tragedies especially, where the interest of the reader is intensely excited by the great art shewn in the minute delineation of a particular passion, and where he is forced to forget the artificial theory of the authoress. The first volume of the *Plays of the Passions* appeared in 1798, and met with remarkable success. Four years afterwards, she published a second volume; in 1804, *Miscellaneous Plays;* in 1812, the third volume of her *Plays of the Passions;* and in 1836, three volumes of dramatic poetry. The most popular as well as the most powerful of her works is the tragedy of *De Montfort*. It was brought upon the stage in London, Kemble acting for eleven nights the character of the hero. Many of Miss B.'s minor pieces are very sweet, simple, and beautiful; and are marked by a sprightly grace of versification, and a playful serenity of spirit, which pleasantly remind one of the personal character of the authoress herself.

BAI'LLIE, MATTHEW, M.D., a distinguished physician and anatomist, was born on the 27th October 1761, in the Manse of Shotts, Lanarkshire, Scotland. His father was descended from the family of Baillie of Jerviswood, so noted in the history of Scotland during the reign of Charles II.; his mother was a sister of the two celebrated anatomists, William and John Hunter; and one of his sisters was Joanna Baillie, the poetess. Talent seems to have been both hereditary and abundant in the family. On account of his abilities, his father was appointed professor of divinity in the university of Glasgow, where young B. went through the usual curriculum, and afterwards proceeded to Balliol College, Oxford, as an exhibitioner on the Snell foundation. In 1780, he commenced his anatomical studies in London under the care of his uncle, and was frequently employed as demonstrator to the latter in his theatre at Great Windmill Street. His success in this capacity was so great, that on the death of Dr Hunter, in 1783, he was found qualified to become his successor. In 1784, he began to lecture, and acquired a high reputation as a vigorous and lucid expositor of the science of anatomy. In 1795, he published a small work entitled, *The Morbid Anatomy of some of the most Important Parts of the Human Body*. It made an era in medical science. In addition to the information formerly scattered through the writings of Bonnetus, Lieutaud, Montagni, and others, it contained a multitude of ingenious observations made by his uncle and himself, and greatly enhanced our knowledge of the changes produced on the human frame by disease. It had a remarkable influence on the study of medicine, and excited in a greater measure, perhaps than any other book, a spirit of careful induction among professional men. In 1799, Dr B. relinquished his anatomical lectureship, and in 1800, his appointment as physician to St George's Hospital, which he had held for thirteen years. He now devoted himself exclusively to his duties as a medical practitioner, and by his honourable assiduity succeeded in realising a large fortune. In one of his busiest years, when he had scarcely time to take a single meal, his professional income is said to have reached £10,000. In 1810, he was appointed physician to the king, and offered a baronetcy, which, however, he declined. At last, worn out with incessant labour, he died on the 23d September 1823.

BAI'LLIE, ROBERT, one of the most eminent, and perhaps the most moderate of all the Scottish Presbyterian clergy during the time of the civil war, was born at Glasgow in 1599, and educated at the university of that city. In 1622, he received episcopal ordination—episcopacy being then nominally the established religion of the country—from Archbishop Law, and was shortly after presented to the parish church of Kilwinning. At first a maintainer of the doctrine of passive obedience, he seems to have changed his opinions on this point some time during 1630–1636. In 1638, he sat in that famous General Assembly of the Kirk of Scotland which met in Glasgow to protest against episcopacy being thrust on an unwilling people, but conducted himself with greater prudence and temperance than was quite agreeable to his excited brethren. However, he soon threw himself eagerly into the national cause. In 1640, he was selected by the Scottish leaders, on account of his pamphlet against Laud's party, as a proper person to go to London, along with other commissioners, to prepare charges against Archbishop Laud, whose rash and tyrannical measures were alleged to have been the origin of the recent hostilities against the sovereign. On his return to Scotland in 1642, he was appointed joint-professor of divinity at Glasgow, along with Mr David Dickson, an equally distinguished, but less moderate divine. In 1643, he was again sent to London as a delegate to the Westminster Assembly of Divines, where he conducted himself in an unobtrusive manner, but cordially concurred in the doctrines which were drawn up. It is curious to notice, in connection with this incident of his career, that though Mr B. had himself experienced the injustice of intolerance, like almost every other theologian of his age, he vehemently discarded the principle of toleration, and asserted the divine right of presbytery with as much emphasis as Laud did

rine right of episcopacy. After the execu- Charles I., in 1649, B. was chosen by urch to proceed to Holland, and to invite II. to accept the Covenant and crown of d. Though it was not easy to deal with Charles's slippery character, B. is admitted e borne himself in the matter with great ce and dignity. After the Restoration, he de Principal of Glasgow University. He died 62. His *Letters* are a valuable contribution knowledge of the times.

LLIE, Robert, of Jerviswood, happily de- as the Scottish Sydney, was a native of shire, and distinguished himself during the art of the reign of Charles II. by his bold ion to the tyrannical misgovernment of the f Lauderdale. Having on a certain occasion 676) rescued a relative, the Rev. Mr Kirkton, ne clutches of Archbishop Sharpe's principal r, a wretched profligate of the name of rs, who pretended that he had a warrant for rehension of the clergyman, but refused to , B. was actually prosecuted for interfering ent the illegal capture of his friend. For this , an antedated warrant was furnished to rs, signed by nine of the councillors. The s of Athole afterwards admitted to Bishop that he was one of the nine who lent their to this infamous document. The case was re made out to be a tumult against the nent. B. was fined in 6000 merks (£318). ised to pay, and was sent to prison; but so was the indignation of the Scottish gentry, was released at the end of four months, in ration of payment of one-half of his fine to rs. In 1683, B. took a prominent part in a of emigration to South Carolina, as he saw r refuge from the degrading tyranny of the nent. About the same time, however, he into correspondence with the heads of the ritan party in London, whose leaders were , Sydney, and the Duke of Monmouth, and iently repaired to that city to concert mea- r a vigorous insurrection against the govern- ıot, however, so far as he was concerned, with to revolution, but as the only means of secur- equate reforms. On the discovery of the se Plot, B. was arrested, and sent down to d. Accused of conspiring against the king's l of being hostile to monarchical government, tried at Edinburgh, and condemned to death ridence at once insignificant and illegal. His both on his trial and during his imprison- was such, that his cousin, Bishop Burnet, d 'it looked like a reviving of the spirit of the of the old Greeks or Romans, or rather of mitive Christians and first martyrs; and the ted Dr Owen speaks of him as a 'great spirit,' on of the greatest ablutions I almost ever met The sentence was carried into execution on h December 1684. It is to be regretted that opportunities were afforded B. of achieving g really great, for he seems from all accounts possessed a remarkable strength of character ldu fearlessness of spirit.

LLY, Jean Sylvain, a distinguished French President of the National Assembly of 1789, ayor of Paris, was born in that city, Septem- , 1736. Originally intended by his father artist, he first turned aside into literature, becoming acquainted with Lacaille, he was ately induced to study astronomy, which to be the true sphere of his genius. In 1763, ented to the Académie des Sciences his *Lunar utions;* in 1766, appeared his *Essay on the Satellites of Jupiter, with Tables of their Motions;* and in 1771, a treatise on the light of these satellites, remarkable for the profundity of its astronomical views, and which classed him at once among the greatest astronomers of his time. His historico-scientific works, especially his *History of Indian Astronomy*, are full of learning and ingenious disquisition, and written with great elegance. In 1777, he published his *Letters on the Origin of the Sciences;* and in 1779, his *Atlantis of Plato*. In 1784, he was elected a member of the Académie Française; and in the following year, of the Académie des Inscriptions. The *éloges* which he wrote about this period for the Académie des Sciences on Charles V., Molière, Corneille, Lacaille, Leibnitz, Cook, and Gresset, were very highly praised. Fontenelle was the only Frenchman before him who had enjoyed the honour of being a member of the three académies at once. The revolution interrupted his peaceful studies. During the earlier part of it, he occupied a very prominent position. Elected President of the National Assembly, June 17, 1789, and Mayor of Paris on the 15th of July, he conducted himself in these capacities with great integrity and purity of purpose; but at last lost his popularity by allowing the National Guard to fire on the masses who were assembled in the Champ de Mars, on the 17th of July 1791, to demand the dethronement of the king. He now threw up his mayoralty, considering it impossible to satisfy either party, withdrew altogether from public affairs, and went to live first at Nantes, and afterwards with his friend Laplace at Melun. Here he was seized by the Jacobin soldiery, and brought to Paris, where he was accused of being a royalist conspirator, condemned and executed with the usual Jacobin preliminary of savage insult, November 11, 1793. Among his papers were found, and afterwards published, an *Essay on the Origin of Fables and Ancient Religions* (1799), and *Memoirs of the Revolution by an Eye-witness* (1804). There cannot be two opinions regarding the merit of B.'s style, but his historico-astronomical speculations are now considered fantastic.

BAILMENT, an English law term, defined to be 'a delivery of goods for a particular purpose, upon a contract, express or implied, that the purpose shall be carried into effect, and that, when that is done, the goods shall be restored by the bailee, or person to whom they are delivered, to the owner or bailor, or according to his directions.'—*Tomlin's Dict.*

BAILY, Edward Hodges, R.A., an eminent sculptor, was born at Bristol on the 10th March 1788. In 1807, he went to London, saw Flaxman, and entered his studio. In 1809, he gained the silver medal at the Society of Arts and Sciences, and the silver and gold medals at the Royal Academy. His works during this part of his career were chiefly, if not altogether, classical figures. They exhibit great care in execution, and are simple and pure in conception; but it was not till his twenty-sixth year that the full power and originality of his genius manifested itself in his celebrated 'Eve at the Fountain,' a figure of exquisite grace and loveliness. His next works were, 'Hercules casting Lycus into the Sea,' 'Apollo Discharging his Arrows,' and 'Maternal Love.' George IV. also employed him, along with other artists, to execute the sculpture in front of Buckingham Palace, the figures on the marble arch, and the 'Triumph of Britannia,' as also the *basso-relievi* that surround the throne-room. Besides these, B. executed a great number of busts and statues of distinguished contemporaries, such as Telford the engineer, Earl Grey (14 feet high), and Sir Astley Cooper. The statue of Nelson, in Trafalgar Square, is likewise the work of his hands. His 'Eve listening

to the Voice,' the 'Sleeping Nymph,' 'Girl preparing for the Bath,' and 'The Graces Seated,' are among the finest efforts of his genius. Died 22d May 1867.

BAILY, FRANCIS, an eminent English astronomer, was born at Newbury, Berks, in 1774, and died in London in 1844. In the midst of active business as a London stockbroker, he laid the foundation of his scientific fame, and during the years of life usually devoted to repose, underwent labours and rendered services to astronomy, which entitle him to be regarded as one of the most remarkable men of his time. Among the chief of these services were his share in the foundation of the Astronomical Society, and in the improvement of the *Nautical Almanac*, his laborious repetition of Cavendish's pendulum experiments, and the production of the Astronomical Society's Star-catalogue. The latter, says his biographer, Sir J. Herschel, 'put the astronomical world in possession of a power, which may be said, without exaggeration, to have changed the face of sidereal astronomy.' In addition to several standard works on Life-annuities, &c. (1808—1813), and an immense mass of contributions to the *Memoirs of the Astronomical Society*, he wrote a valuable *Life of Flamsteed* (1835), which gave rise to much hot discussion on the subject of that eminent man's connection with Newton.

BAINI, GIUSEPPE, one of the most distinguished scientific musicians of modern times, was born in Rome on the 21st October 1775. In 1795, when still only a pupil in the Seminario Romano, he was admitted among the singers in the Papal Chapel, on account of his fine voice and his musical acquirements. Having been initiated by G. Zannaconi into the art of composition, he soon gained distinction by his compositions. The severe gravity and profound science of these contrasted strongly with the careless style and shallow dilettantism of the modern Italian masters. B. has secured for himself a prominent place in musical literature, less, however, by his compositions than by his historical researches, which he found both encouragement and opportunity to make, when he was appointed director of the papal concerts in 1804, and general director of the choir in 1814. His principal work is his *Memorie Storico-critiche della Vita e delle Opere di Giov. Pierluigi da Palestrina*, &c. (2 vols. Rome, 1828). It is a valuable work, although disfigured by prejudices. The German edition of B.'s work, additions and explanations by Kandler, published by Kiesewetter (Leip. 1834), is especially deserving of notice, as very soon after its first publication it became a rare book on account of the small number originally published. Winterfeld published an edition of the same work with critical remarks (Breslau, 1832). B. died on the 10th of May 1844.

BAIRAKTAR, or, more correctly, Bairak-dar, signifying Standard-bearer, is the title of the energetic Grand Vizier Mustapha. He was born in 1755, and was the son of poor parents. He entered the military service at an early age, and soon distinguished himself by his valour. When he was Pacha of Rustchuk in 1806, he fought not without success against the Russian army, which had advanced into Moldavia and Wallachia, and had taken Bucharest. After the revolt of the janizaries in 1807, by which Selim III. (q. v.) was deposed from the throne, in favour of Mustapha IV., B. at first concealed his attachment to the deposed monarch, and marched with his troops apparently against the revolted Servians; but as soon as he reached Adrianople, he compelled the grand vizier to return with him to Constantinople, in order to restore the throne to Sultan Selim. On their return, they found this prince murdered, and his dead body lying in the first court of the seraglio. Filled with rage at this sight, B. caused all those to be executed who had had any share in the murder. He deposed Mustapha IV., and proclaimed the brother of this prince, Mahmoud II., sultan on the 28th July 1808. B. was now appointed grand vizier. In the exercise of this office, he deposed the grand mufti, the leader of the janizaries, and all the ulemas who had taken any part in the last revolution; while at the same time he was careful to secure the tranquillity of the capital, and strengthened the regular army. His chief object was the annihilation of the janizaries; but, like the unfortunate Selim, he also fell a victim to these fierce bands of soldiery, who resisted everything like military discipline. Favoured by the fanatical people, the janizaries rebelled, and, with the support of the fleet, attacked the seraglio on the 15th November 1808, and demanded the restoration of Mustapha IV. B. defended himself bravely; but when he saw that the flames threatened to destroy the palace, and that he was in danger of falling alive into his enemies' hands, he strangled Mustapha, threw his head to the besiegers, and then blew himself up.

BAIRD, SIR DAVID, Bart., a general in the British army, was born 6th December 1757, at Newbyth, Scotland. He entered the service in 1772 as an ensign in the 2d Foot, was promoted to a lieutenancy in 1778, and immediately after obtained a company in the 73d, a Highland regiment just raised by Lord Macleod, with which he sailed to India. In the course of a few months, the young officer was plunged amid the perils of a sudden and sanguinary war. The English had excited the hostility of Hyder Ali by a gross breach of faith; and in the July of 1780, the latter burst into the Carnatic at the head of 100,000 men, disciplined and commanded by French officers. On the 10th of September, a portion of the English army fell into an ambuscade at Perambacum, and was cut to pieces. Among the few who remained alive to be taken prisoners was Baird, whose heroism had actually startled the French officers who were opposed to him. He was thrown into a dungeon at Seringapatam, where he endured a captivity of four years, that must have been peculiarly galling to a spirit so fierce, restless, and resolute as his. Released in July 1784, he obtained the majority of the 71st in 1789, and in the October of the same year visited England. In 1791, he returned, a lieutenant-colonel, and took part in several important sieges, attacks, and skirmishes; in 1795, he received a colonelcy; in 1798, he was raised to the rank of major-general; and in 1799 memorably signalised himself at the victorious assault of Seringapatam. He led the storming-party, having obtained that perilous honour at his own urgent request, Colonel Wellesley (afterwards Duke of Wellington) commanding the reserve. In requital of his brilliant services, he was presented by the army, through the commander-in-chief, General Harris, with the state-sword of Tippoo Saib, and also with a dress-sword from the field-officers who served under him at the assault. His merit was likewise acknowledged by the home government. In the following year, he was appointed to the command of an expedition against Batavia, but which was afterwards sent to Egypt. On his return to India, he found that the star of Wellesley was in the ascendant; and B., who had already complained of the preference given to that officer, and who was, besides, of opinion that his own merits were constantly overlooked, applied for leave of absence, and sailed for Europe in 1802. He was received at court with great distinction, knighted in June 1804, and made a K.C.B. in the following August. In 1805, he commanded an expedition against the Dutch settlements at the Cape of Good

Hope, which was successful; in 1807, he commanded a division at the siege of Copenhagen; and in 1808, was sent to Spain with an army of 10,000 men, to assist Sir John Moore. He distinguished himself in the battle of Corunna, January 16, 1809. Moore having been killed in the action, Sir David succeeded to the chief command, and had the honour of communicating intelligence of the victory to government. On this occasion, he received, for the fourth time in his life, the thanks of parliament, and was created a baronet. After this period, he retired from active service. In 1810, he married Miss Preston Campbell, a Perthshire lady, by whom he left no issue. He died, August 18, 1829.

BAIREUTH, a city, with a pop., in 1871, of 17,837, capital of the province of Upper Franconia, Bavaria, and formerly the capital of the principality of the same name. B. is beautifully situated on the Red Mayn, about 126 miles due north from Munich. Its streets are broad and well paved, and are interspersed with groves, promenades, fine gardens, and public fountains. Its principal buildings are the old palace, now the residence of the provincial governor; the new palace, containing a gallery of paintings; the mint, opera-house, riding-school, infirmary, and town-hall. Its chief articles of industry are leather, cottons, woollens, linen, tobacco, parchment, and porcelain. Jean Paul Richter died here in November 1825, and a monument has been erected to his memory.

BA'JA, an important market-town of Hungary, in the circle of Bacs, on the banks of the Danube, and celebrated throughout Austria for its annual swine-fair. Grain and wine, in large quantities, are produced in its neighbourhood. Pop. 14,500.

BA'JAN. See BEJAN.

BAJAZE'T, or BAJASI'D (pronounced Bayaze't), I., Sultan of the Turks, was born in 1347. In 1389, he succeeded his father, Murad I., who fell in battle near Kossova, fighting against the Servians. Immediately on ascending the throne, he inaugurated his rule, after the fashion of eastern kings, by strangling his younger brother Yacub, lest he should dispute the succession. In three years, he conquered Bulgaria, a part of Servia, Macedonia, and Thessaly; he also subdued most of the states of Asia Minor. From the rapidity with which these extraordinary conquests were effected, he received the name of Ilderim—that is, Lightning. He even blockaded Constantinople itself for ten years, thinking to subdue it by famine. To rescue this city, King Sigismund of Hungary (afterwards Emperor of Germany) assembled a large army, in which there were 2000 French nobles under the command of the Duke of Nivvy. With this army, King Sigismund attacked the city of Nikopolis, in Bulgaria, situated on the Danube. B. hastened to meet him, and gained a decisive victory over the allied Hungarians, Poles, and French, on the 28th September 1396. Sigismund escaped captivity only by a speedy flight in disguise; but the greater part of the French, through whose impetuosity the battle was lost, were taken prisoners, and were nearly all executed. B. would now have entirely destroyed the Greek empire, if he had not been prevented by Timur (q.v.), who attacked his possessions in Asia Minor, and completely defeated him on the 16th June 1401, near Angora, the capital of what was anciently called Galatia, on the very spot where Pompey had formerly overthrown Mithridates. B. himself fell into the hands of the conqueror, who treated him with great generosity. The story that he was carried about imprisoned in a cage is without any historical foundation. B. died in 1403, in the camp of Timur. He was succeeded in the government by his son Soliman I. B. was honourably distinguished by his efforts to improve the administration of justice. During the 14 years of his reign, he built a large number of mosques, among others, one at Adrianople, and a second at Broussa, which two cities were then the ordinary residences of the Ottoman princes.

BAJAZE'T II., son of the Sultan Mohammed II., the conqueror of Constantinople, was born in 1447, and ascended the Ottoman throne after his father's death in 1481. His reign, which lasted 32 years, was a succession of uninterrupted wars against Hungary, Poland, Venice, Egypt, and Persia, which were carried on with various success and without any events of striking importance, yet which served on the whole to establish the Ottoman power. The last years of his reign were much disturbed by disputes between his sons about the succession to the throne. Influenced by the preference shewn by the janizaries for his younger son Selim, B. abdicated in his favour, but died before he could reach the place of his voluntary exile, in the neighbourhood of Adrianople, in the year 1513. B. was a friend to the dervishes, at the same time liberal and fond of pomp and splendour. Many of the most beautiful mosques in Constantinople and Adrianople were built by him, and fitted up in a style of the greatest magnificence.

BA'JIMONT'S ROLL, the name given to a valuation, according to which the ecclesiastical benefices of Scotland were taxed, from the end of the 13th c. to the Reformation. It took its name from an Italian churchman, Benemund or Baiamund de Vicci, who was sent from Rome by the pope about the year 1276, to collect the tithe, or tenth part of all the church livings in Scotland, for an expedition to the Holy Land. Hitherto, the Scotch clergy had been taxed according to a conventional valuation, called the *Antiqua Taxatio*. But Baiamund set this aside; and, in spite of their reclamations, assessed the benefices at their actual yearly worth, or *verus valor*. Although more than once referred to as an authoritative document in statutes of the 15th c., no complete copy of B. R., in its original shape, is now known to exist. A contemporary manuscript of so much of the Roll as applies to the archdeaconry of Lothian, or that portion of the diocese of St Andrews which lies to the south of the Forth (comprehending the counties of Berwick, Haddington, Edinburgh, Linlithgow, and part of Stirlingshire), is preserved at Durham. The real value of the benefices in this district, as set down in B. R., exceeds the conventional value in the *Antiqua Taxatio* in the proportion of 420 to 286. A copy of B. R., as it appears to have existed in the reign of King James V. (1513–1542), is preserved in the Advocates' Library at Edinburgh, in a hand of the beginning of the 17th c. It is full of inaccuracies; and it omits all livings of less than 40 marks a year. Of the *Antiqua Taxatio*, which was superseded by B. R., there are good copies in the handwriting of the 13th c., so far as concerns the benefices in the four dioceses of St Andrews, Brechin, Aberdeen, and Moray.

BAJOCCO, or **BAIOCCO** (pl. BAJOCCHI), is a copper coin in the Papal States, value nearly a halfpenny. It is 1-100th of the scudo, which is equal to 4s. 3½d. In the island of Sicily, the Neapolitan *grano*, the 1-100th part of the ducato (= 3s. 4d.), is also called a bajocco.

BA'JUS, MICHAEL (properly, De Bay), one of the most distinguished theologians of the Catholic Church in the 16th c., was born in 1513 at Melun. He studied at Louvain, and became professor of theology there in 1550. He was present at the Council of Trent in 1563, and also in 1564. He was the founder of a system of theology, based

directly on the Bible and the writings of the Fathers, and setting aside the scholastic method. He had studied much the writings of St Augustine, and therefore confined himself closely within the circle of ideas held by this Father of the church, whose doctrines of the entire inability of the human will to do good, and the absence of merit in all good works, B. defended against the Jesuits. The assertions that the human will, so long as it is left to its own freedom, can do nothing but sin, and that even the mother of our Lord was not free from original and actual sin, together with other such doctrines, drew on him the accusation of heresy. Seventy-six of his propositions were condemned by a papal bull. B. submitted, but nevertheless did not give up his doctrines, and, in consequence, the persecutions to which he was subjected did not cease. He died December 16, 1589, having earned the reputation of great learning, pure manners, and singular modesty. He may be regarded as the predecessor of the Jansenists, who inherited his Augustinian views, which were at that time termed Bajanism. His writings, mostly of a polemical nature, were published by Gerberon (2 vols. Cologne, 1696).

BAJ'ZA, Anton, a Hungarian poet and prose-writer, was born January 31, 1804, at Szilcsi, in Hertes. His Poems (2 vols. 1835), which were published in Pesth, earned for him a place among the best Hungarian lyric poets. In the *Kritischen Blättern*, to which he contributed from 1831—1836, the *Athenæum*, and the *Figyelmezö* (Observer), to which he contributed from 1837—1843, in common with many of the best literary writers of the day, he exercised a beneficial influence on the rising literature of Hungary by his severe criticism, and his solid and theoretically correct essays. He likewise materially aided the Hungarian stage, then in its infancy, by the publication of the *Ausländischen Bühne* (Foreign Dramas, Pesth, 1830), and also by his exertions as director of the National Theatre, opened in Pesth on August 22, 1837. At the same time, he had begun to occupy himself with historical studies, and enriched the literature of Hungary, very poor in this respect, with a *Történeti Könyvtár* (Historical Library, 6 vols., Pesth, 1843—1845), which contained translations from many excellent foreign historical works. He also published a compilation from the German, *Uj Plutarch* (The Modern Plutarch, Pesth, 1845—1847). His *Világ'örtéret* (Universal History, Pesth, 1847) is a rather unskilful compilation from Schlosser, Heeren, Rotteck, and other German historians. After March 1848, Kossuth appointed him editor of his half-official organ, the *Kossuth Hirlapja* (July till December 1848), in conducting which, however, he displayed no great editorial talent. B. was made a member of the Hungarian Academy in 1832. He died, March 1858.

BA'KER, Sir Richard, author of the *Chronicle of the Kings of England*, a book long esteemed and quoted on all matters of English history by the country gentry. Addison makes his model squire, Sir Roger de Coverley, refer to it frequently. Notwithstanding its reputation, however, among that class, the book had no lack of errors, and is now all but forgotten. Its author was born in Kent, or, according to other accounts, in Oxfordshire, about the year 1568. He was educated at Oxford University, and in 1603 was made a knight. About 1620 he married and settled in Oxfordshire, of which county he was made high sheriff; but he was soon after thrown into the Fleet Prison for debt which his wife's family had contracted, but for which he had become responsible. Here he wrote his *Chronicle*, first published in 1641, besides several pious works of less note. He died in prison, in great poverty, in 1645.

BA'KERIES, Army. Armies have generally the means of obtaining soft or loaf bread, though not till recently could this be said of the British army. The French, ever since the time of Louis XIV., have been accustomed to take portable ovens with their armies; those now used will each bake 450 rations at once. Outside Sebastopol, in the winter of 1854, the British soldiers sometimes willingly exchanged with the French three or four pounds of biscuit for one pound of soft bread. The efforts since made to improve the sanitary condition of the army have included the establishment of travelling bakeries for field-service. Under the commissaries, the troops now rarely fail to obtain their daily rations of fresh-baked bread. We were last among the greater nations to make this obvious improvement, but the French depend more on bread and less on meat than the English; and this may partly account for the difference. The French soldiers are taught to construct field-ovens, and to bake their bread in camp, while government B. are established all over France, entirely conducted by soldiers. Among other lessons afforded by the siege of Sebastopol, was one relating to an improved supply of army-bread. Two screw-steamers, the *Bruiser* and the *Abundance*, were sent out to Balaklava, one provided with machinery for grinding corn, and the other with machinery and ovens for making and baking bread. In each case, the ship and the machinery were propelled by the same steam-engine. When quietly anchored in the harbour, the mill ground 24,000 lbs. of flour per day—better in quality, and cheaper than could have been obtained by contract. The bakery ship *Abundance* had four ovens of 14 bushels' capacity each: it baked in an excellent manner 6000 loaves of 3 lbs. each per day, which loaves were sent up to the siege-army as soon as cooled. The ships and machinery were sold when the war was over—a proceeding which the commissariat officers much regretted; but the experience thence obtained will not be lost. The improved arrangements suggested for the meat-rations will be noticed under Cookery, Army.

BA'KEWELL, a small but very ancient town in Derbyshire, on the left bank of the Wye, near its confluence with the Derwent, and 24 miles north-north-west of Derby. It lies on the slope of a hill, in the midst of very beautiful scenery, in a carboniferous limestone tract, and in the vicinity of black marble quarries, and of coal and lead mines. Its chalybeate springs and warm baths are much resorted to. The celebrated Arkwright first established cotton-mills here. On the opposite bank of the Wye are the traces of a castle built by Edward the Elder in 924. B. is now the property of the Duke of Rutland, whose seat is Haddon Hall, two miles from the town. B. is a centre for visiting the fine scenery of North Derbyshire and the Peak; and the streams in the vicinity are much resorted to by anglers. It contains a spacious cruciform church, founded in Saxon times, and shewing specimens of ecclesiastical Gothic architecture of three different periods. The special industry of B. is the turning, polishing, and inlaying of the local marble. Pop. (1871) 2283.

BA'KEWELL, Robert, a celebrated agriculturist, was born in 1726 at Dishley, in the county of Leicester, and died in 1795. He does not appear to have written anything, even upon the subjects with which he was so well acquainted, so that his fame rests entirely upon his successful efforts to improve the breed of domestic animals

His reputation was so great as a breeder of sheep, that he is said to have received the fabulous sum of 400 guineas for one season of a ram. The long-horned breed of cattle which he introduced is still known as the Dishley or New Leicestershire breed. His horses were also famous, and almost as profitable to him as his sheep. One of his objects was to produce a breed of animals that would fatten on the smallest quantity of food.

BAKHTEGA'N, a salt-lake of Persia, province of Farsistan, from which remarkably fine salt is obtained. Its size is variously stated - some writers making it 60 miles in length, with an average breadth of 8 miles; others, only 70 miles in circumference.

BA'KING is the mode of cooking food in an air-tight chamber or oven. The term is also applied in the manufacture of Bricks (q. v.), Porcelain (q. v.), &c. The B. of bread will be treated under BREAD. The oven attached to kitchen-grates for cooking is simply an iron chamber, with flues for conveying the heated gases of the fire round it. In B., strictly so called, the oven is kept close, so that the steam and aroma arising from the enclosed substances are confined; but by opening ventilators a current of air is produced, and then these ovens may be used for what is called *oven-roasting*. The rank taste that often characterises baked dishes is thus avoided. Ovens are now often heated by water, or by steam, and also by gas. Meat for B. is placed in a dish, from the bottom of which it is raised on a wire frame or trivet. In M. Soyer's Baking-dish, a wire frame rests on the edge of the dish, and on this potatoes are laid; a trivet, rising above the frame, supports the meat; while the bottom of the dish contains a Yorkshire pudding; the dripping thus falls upon the potatoes and pudding below.

B., although a convenient mode of cooking, is not considered quite so good as Roasting (q. v.). The practice of having recourse to the baker's oven, saves both trouble and expense in heating, and is a matter of necessity with those who have not means of cooking at home; but it has this chief objection, that every dish becomes impregnated with the steam and odours of all the rest. Soyer pronounces it to be semi-barbarous.

BAKONY WALD (Forest of Bakony), a densely wooded mountain range of Hungary, south of the Danube, dividing the great and little Hungarian plains. Immense herds of swine are annually driven hither to feed upon the mast of the forest. The keepers of these swine furnish those notorious robbers who play so important a part in the ballads of the Hungarian people, and in the imagination of travellers. The saintly King Stephen founded a cloister in the forest 1030 A.D. Only in recent times has this dangerous territory been thoroughly explored. The hills have an average height of 2000 feet, with quarries of valuable marble, in which a considerable export trade is done.

BAKSHISH. The ordinary meaning of this word in Persian is a present; but in the East, in modern times, it has acquired the special signification of gratuity (Gr. *Trinkgeld*), which, however, the orientals do not quietly wait to receive, but demand loudly, and even insolently. Every traveller, whether in Turkey or in Egypt, in Asia Minor or in Syria, if he receives the smallest service from any one, is immediately reminded by the cry of 'Bakshish, Bakshish,' to pay for the courtesy by a gift of money. Even when the ambassadors to the Supreme Porte obtain an audience from the sultan, or from any of the high dignitaries, they are obliged, by the prompt gift of a B., to avoid a peremptory demand for it on the part of the door-keepers and other servants. By degrees, the B. has been fixed by custom at certain sums.

BAKTSHI-SERAI' (the 'City of the Gardens'), the residence of the ancient princes or khans of the Crimea, stands in a deep limestone valley, not far from the present capital, Simferopol. The city is kept in excellent repair, and had a pop. in 1867 of 11,448, consisting almost exclusively of remnants of the old Tatar inhabitants. It thus presents a striking contrast to the modern towns of the Crimea, and is one of the most singular in Europe. The palace of the ancient khans has been completely restored by the Russian government in the oriental style. It consists of a great labyrinth of buildings, courts, and gardens, and is situated about the middle of the town, dividing it into two parts. The chief manufactures of the place consist of articles of copper, Turkish saddles, and silk.

BAKU', a seaport town of the Apsheron peninsula, in the Caspian Sea. It is under the dominion of Russia, and contains 15,933 inhabitants, chiefly Persians and Armenians. The whole soil around B. is impregnated with naphtha, which forms an important branch of its industry. Some of the fountains ignite spontaneously, and this natural phenomenon has caused B. to be esteemed as a holy city by the Parsees or fire-worshippers, many of whom resort to it from very long distances. B., besides its trade in naphtha, exports cotton, silk, opium, saffron, and salt. The Arabian, Masudi, is the first who mentions B., about 943, and he gives an account of a great volcanic mountain in its vicinity, which is now extinct. B. was ceded by the Persians to the Russians in 1813. Captain Baker states that the refuse of the oil drawn from the wells is, after the naphtha has been distilled from it, used now with great success as a substitute for coal in the steamers on the Caspian Sea. He believes that in consequence of the discovery of the value of the oil as a fuel, B., on the completion of railway communication with Russia and Mazanderan, will become a great military and ship-building centre for the Russian territories on the Caspian Sea.

BALA BEDS, a local deposit, occurring in the neighbourhood of Bala, in North Wales, and forming a group in the Lower Silurian of Murchison. They consist of a few beds, rarely more than 20 feet in thickness. The beds are chiefly composed of hard crystalline limestone, alternating with softer argillaceous bands, which decompose more freely, and leave the limestone like a cornice moulding, affording a characteristic by which, at a considerable distance, the B. B. can be distinguished from the rocks of hard gritty slate above and below. Trilobites and Cystideæ are the predominant fossils of the group. Calcareous beds, containing similar fossils, have been noticed in the Silurian district of the south-east of Ireland, and referred to this group.

BALAAM, the name of a prophet who figures prominently in the early history of the Israelites. He is first mentioned in Numbers xxii. 5, where Balak, king of the Moabites, alarmed at the irruption of the chosen people into his territories, is represented as sending messengers to Pethor, in Mesopotamia, the dwelling-place of the seer, to beseech him to come and curse the invaders. The narrative is, of course, familiar to every one, and it is therefore unnecessary to recount it; but it is marked by two peculiarities, which have excited much speculation and controversy. The first is, the admittedly prophetical character of B., who was a *Gentile*; the second is, the curious miracle in the case of his ass. With regard to the supernatural

powers attributed to B. the most prevalent hypothesis is, that he was the last relic of the patriarchal age, during which communion with God was not formally restricted to one race, but diffused more or less among all the Semitic peoples. Some, again, suppose that his knowledge of God, from whom he apparently received miraculous communications, was derived from traditions of the primitive faith scattered over Mesopotamia by Abraham, Jacob, Laban, &c.; though Hengstenberg conceives that he had been led to renounce idolatry by hearing of the miracles which attended the exodus of the Israelites, anticipating, as a reward for his change of worship, a further insight into futurity, and a greater power over nature. B. has ever been considered a type of those men who prostitute their powers and hold the truth in unrighteousness, receiving the wages thereof.

BALÆ'NA. See WHALE.

BALÆNO'PTERA. See RORQUAL.

BALAKLA'VA, a small port in the south-west of the Crimea, separated by a rocky peninsula from the harbour of Sebastopol, from which the direct distance is about 6 miles. Population in 1867, 742. The harbour, which affords secure anchorage for the largest ships, is perfectly landlocked, the entrance being so narrow as scarcely to admit more than one vessel at a time. To the east, overlooking the bay from a rocky eminence, are the ruins of a Genoese fortress. The foundation of the work is excavated into numerous chambers and galleries. It is the *Symbolon Limen* of Strabo; and the present name is supposed by Dr Clarke to be a corruption of the Genoese *Bella-chiara*, or Fair Haven. This was long the seat of a Greek colony; in the 14th c., it fell into the hands of the Genoese; about the end of the 15th, they were expelled by the Turks; and on the conquest of the Crimea by Catharine II. of Russia, it was made a military station for a regiment of Greeks and Albanians. In 1854, a few days after the battle of Alma, the town was occupied by the British army under Lord Raglan, and the harbour formed, during the ensuing campaign, the headquarters of the fleet, and the basis of operation of the army. Here ensued those scenes of mismanagement and confusion that have rendered B. a synonym for chaos, and the recital of which, with the resulting privations and misery to the soldiers, stirred so terribly the heart of England in the winter of 1854—1855. A terrible hurricane on November 14, 1854, in which nine vessels were totally destroyed, and several others seriously injured, tended greatly to increase the confusion which incapacity and divided responsibility first occasioned at Balaklava. Soldiers, six miles distant, were dying for want of food, clothing, and medicine, which were hidden hopelessly beyond reach in store-rooms at B., or stowed away in the holds of ships that were not permitted to enter the harbour. Transport vessels, for which the country was paying enormous sums of money daily, were kept lying idle in port with their most anxiously awaited cargoes (for lack of which the troops were perishing by hundreds) unladen, while poor mutilated and dying soldiers lay miserably exposed on the heights for want of ships to convey them to the hospitals at Scutari. The rebuilding of the greater part of the town, the formation of a line of railway between B. and the camp, and certain official investigations in 1855, completely remedied this disgraceful state of things. The 25th of October 1854 was signalised, on the heights between the town and the Tchernaya, by those unparalleled cavalry charges, the record of which is among the saddest but proudest memories of the British army. A detailed account of the events connected with Balaklava is given in the *Pictorial History of the Russian War*, published by W. and R. Chambers.

BA'LANCE (of doubtful derivation), an instrument for ascertaining the weight of bodies in grains, ounces, pounds, or any other units of weight. The ordinary B. consists of a lever called a beam, whose point of support is in the middle of its length, and having dishes or scales suspended from either extremity. As it is of importance that the beam should move easily round its point of support, it rests on polished agate or steel planes, by means of knife-edges of tempered steel, which project transversely from its sides, and serve as the axis of rotation. By this arrangement, the surface of contact is reduced to a mere line, and the friction of the axis of the beam on its support almost entirely obviated. The scales are hung by means of chains attached to steel hooks, which rest also on knife-edges, but turned upwards instead of downwards, as in the first case. The essential requirements of a B. of this description are: 1st, That the beam shall remain in a horizontal position when no weights are in either scale; and 2d, That the beam shall be a lever of equal arms, or have the distances between the central knife-edge and those at either end exactly the same. To insure the first of these conditions, it is necessary that the centre of gravity of the beam lie vertically below the point of support, when the beam is horizontal. When such is the case, the centre of gravity at which the weight of the beam may be considered to act, oscillates as in a pendulum round the point of support, and always comes to rest right under that point, thus restoring to the beam its horizontal position when it has been tilted out of it. If the centre of gravity were above the point of support, the beam would topple over; and if it coincided with that point, there being no restoring force, the beam would occupy indifferently any position into which it was thrown, the B. in both cases being useless. That a B. possesses the second of the above conditions, is ascertained by putting weights into the scales which keep the beam horizontal, and then transposing them, when, if it still remain so, the lengths of the arms are equal. Should the arms be of different lengths, a less weight at the end of the longer arm will balance a larger weight at the end of the shorter arm (see LEVER); but when transposed, the larger weight having the longer arm, and the smaller weight the shorter, the beam can no longer remain horizontal, but will incline towards the larger weight. A balance with unequal arms is called a false B., as distinguished from an equal-armed or just balance. When weighing with a false B., it is usual to weigh a body in both scales, and take the arithmetical mean—that is, half the sum of the apparent weights for the true weight. This is near enough to the truth when the apparent weights differ little from each other; but when it is otherwise, the geometrical mean (q. v.) must be taken, which gives the exact weight in all cases.

Although the preceding conditions are of essential importance, they do not supply all that we look for in a good balance. It is necessary, in addition, that the beam should turn visibly from its horizontal position, when there is a slight excess of weight in the one scale as compared with the other. This tendency is termed *sensibility*, and depends upon the weight of the beam, the position of its centre of gravity, and the length of its arms. Let ABD (fig. 1) represent the beam of a balance, C the point of suspension, G the centre of gravity, and ACB the straight line joining the knife-edges, which may be taken as the skeleton lever of the balance. We shall here confine our attention to that construction

where the three knife-edges are in a line, because it is the most simple and at the same time the most desirable. We may, without altering the principles of equilibrium, consider the beam reduced to the

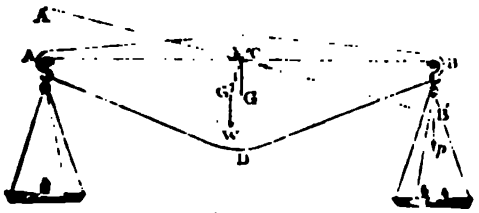

Fig. 1.

lever AB, and embody its weight in a heavy point or small ball at the centre of gravity, G, connected with C by the rigid arm CG. The scales (represented small in the fig. for the sake of space), with the equal weights in them being at an equal distance from C, have their centre of gravity in that point; and their combined pressure acting there, is met directly by the supporting plane, so that they have no influence in determining any particular position of the beam. If a small weight, *p*, therefore, be put into the scale at B, the position of the beam is determined by its rotating tendency (moment) round C, and the counter-rotating tendency of the weight of the beam, W, acting at G. The question of sensibility is thus reduced to the action of the crooked lever GCB, with *p* acting at one end, and W at the other. The relations of the arms and forces of a crooked lever will be found under LEVER. It is only necessary here to state, that the moment of the weight acting at the end of a crooked lever, increases with its size, the length of its arm, and the smallness of the angle which that arm makes with the horizontal line passing through the fulcrum. Let us suppose that, under the effect of the opposing moments, the beam, as represented by the line AB, takes up the position marked by the dotted lines. If, now, we were to lengthen CB', and keep CG' as it is, CG' would rise nearer to the horizontal line, and CB' fall further from it, before equilibrium would be restored; and the inclination of CB', or the beam to the horizontal line, thus being greater, the sensibility of the balance would be increased. Consequently, *the longer the arms of a B. are, all other things being the same, the greater will be its sensibility.* But the same object would be reached by keeping CB' its original length, and shortening CG', or bringing the centre of gravity of the beam nearer to the point of support. The weight of the balance then having a shorter arm, the point G', for the same reason as before, would need to rise higher, and B' sink lower, before A'B' would find its position of rest. Here, also, *the nearer the centre of gravity of the beam is to the point of support, the greater will be the sensibility of the balance.* If now, however, we keep the length of the arms CG', CB' constant, but diminish the weight acting at G, while *p* acting at B' remains the same, it is manifest, that to make up the deficiency in the weight W, the two arms will turn to the left, as in the preceding cases, so as to give W a longer, and *p* a shorter effective arm. The smaller, therefore, the weight acting at G, or *the smaller the weight of the beam, the greater will be the sensibility of the balance.*

In the construction of the B., it is a matter of importance to have the sensibility independent of the amount of weight in the scales, so that, when heavily loaded, a small weight will produce the same inclination as when not loaded at all. This condition is implemented, as we have already shewn, when the three knife-edges are kept in the same straight line. If the line joining the two terminal knife-edges lie below the point of suspension, then the centre of gravity of the equal weights corresponding with the middle of that line, will, upon the turning of the beam, be forced from below that point, and will accordingly have a tendency to resume its former position. The equal weights thus counteract to some extent the effect of the additional weight, in causing the beam to incline, and their influence in this way will be all the greater as they themselves increase. When a B. is too heavily loaded for its strength, the three knife-edges, although previously in a line, do not retain that position, for the arms of the beam yielding to the pressure, cause the terminal knife-edges to sink below the one in the middle, and the knife-edges themselves losing their shape under the pressure, the sensibility is considerably diminished.

When a B. is very sensible, the beam keeps oscillating for a considerable time from one side to the other of the position in which it finally settles. Although such an instrument may be useful for physical and chemical experiments, it is not serviceable for the purposes of ordinary life, where minute quantities of the substance to be weighed are of little value, and where time, and consequently rapidity of indication, are matters of importance. The sensibility of a B. must, therefore, be adjusted to the purpose for which it is designed; sensible balances being employed for weighing finer, and less sensible, or *stable* balances, for weighing coarser materials. The stability, or the tendency of the beam to come quickly to rest, depends on requirements nearly the opposite of those which conduce to sensibility. In the construction treated of above, the stability increases with the moment of the weight of the beam acting at G round C, so that it thus increases with the weight of the beam, and the distance of the centre of gravity from the point of suspension. The stability is also increased, as already

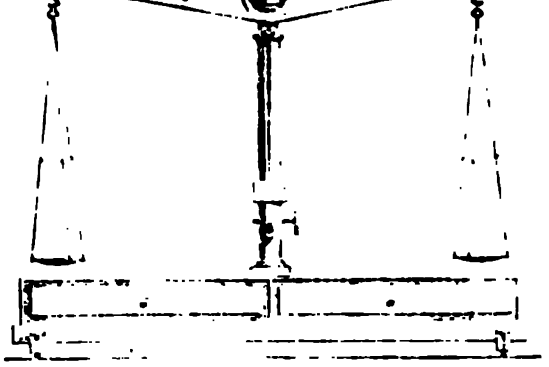

Fig. 2.

shewn, by having the line joining the scale knife-edges below the point of support.

Fig. 2 is the representation of a common form of the delicate balances employed in physical and chemical researches. The beam is constructed so as to combine lightness with strength, and rests by a fine knife-edge on an agate plane. It is surmounted

by a weight moving on a screw, so that the sensibility may be increased or diminished, according as the weight is raised or depressed. In order that the knife-edge may not become blunted by constant contact with the supporting plane, a cross-bar, with two projecting pins, is made to lift the beam from the plane, and sustain its weight when the balance is not in play. The beam is divided by lines marked upon it into ten equal parts, and a small weight made of fine wire bent into the form of a fork, called a rider, is made to slide along to any of the divisions. If the rider be, for instance, $\frac{1}{10}$ of a grain, and if, after the weight of a body is very nearly ascertained, it brings the beam, when placed at the first division next the centre, exactly to its horizontal position, an additional weight of $\frac{1}{100}$ of a grain will be indicated. The use of inconveniently small weights is, by this arrangement, to a large extent obviated. As the beam takes some time before it comes to rest, it would be tedious to wait in each case till it did so, and for this reason a long pointed index is fixed to the beam below the point of suspension, the lower extremity of which moves backward and forward on a graduated ivory scale, so that when the index moves to equal distances on either side of the zero point, we are quite certain, without waiting till it finally settles, that the beam will be horizontal. The same is seen in ordinary balances, only the tongue or index is above the beam; and according to its deviation on each side of the fork or cheeks by which the whole is suspended, is the future position of the beam ascertained. The finer balances are never loaded to more than a pound in each scale, and when so charged, will deflect with $\frac{1}{100}$ of a grain of additional weight in one of the scales, or will turn, as it is technically called, with $\frac{1}{12500}$ of the load. The finest balances turn with $\frac{1}{1000000}$ of the load, and some have been constructed which turned with much less. Even with the best achievements of mechanical skill, no B. can be made whose arms are absolutely equal; and to remedy this defect, the method of double-weighing is resorted to, when the utmost accuracy is demanded. This consists in placing the body to be weighed into one scale, and sand, or the like, into the other, until exact equilibrium is obtained, then removing the body, and putting weights or another body in its place which exactly counterbalance the sand. Both being thus weighed in precisely similar circumstances, must weigh precisely the same.

The Roman B., or *Steelyard* (Ger. *Schnellwage*), is

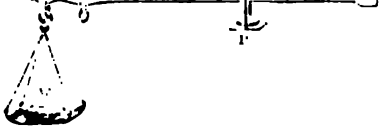

Fig. 3.

more portable than the ordinary balance. It consists of a lever (fig. 3), AB, moving round a knife-edge or point at C. The body to be weighed, W, is put into the scale which hangs from A; and a movable weight, P, is made to slide along the longer arm, until the lever, AB, remains horizontal. The weight of W is then read off from the division at which P rests. If the lever be horizontal when unloaded, then equal weights at equal distances from C will balance each other, so that when W is balanced by P at a distance from C equal to AC, the two are of equal weight; but if equilibrium take place when P, say, is ten times as far from C as A is, then W will be ten times the weight of P; and the same holds for any intermediate point at which P may stand. W weighing as many times P as P's arm is a multiple of W's arm. To weigh a body of 10 lbs. by the ordinary B., a counterweight of 10 lbs. is necessary, making a total load of 20 lbs.; but in the case just supposed, 1 lb. balances 10, making a total load of only 11 lbs. The steelyard has, therefore, this advantage over the common B., that the load on the fulcrum, and consequently the friction, is less. On the other hand, however, there is this disadvantage, that the arms of the steelyard bend unequally under the strain of great weights, which in a B. with equal arms cannot, to the same extent, take place. As the steelyard is ordinarily made, the longer arm preponderates when the lever is unloaded, so that the graduation of the longer arm begins at a point between A and C, and not at C. The *Danish B.* differs from the ordinary steelyard in having the weight fixed to the extremity of the lever, and the fulcrum movable.

The *Bent Lever B.* (Fr. *peson*, Ger. *Zeigerwage*), shewn in fig. 4, is a lever of unequal arms, A, C, B, moving round the pivot C, having a scale, Q, attached to the shorter arm AC, and a fixed weight, W, to the longer arm CB. The longer arm ends in a pointer moving in front of a fixed graduated arc. When a body is put into the scale, the pointer rises from the bottom or zero point of the arc, and rests opposite the mark corresponding to the weight of it. The higher the weight W rises, the longer becomes its *effective* arm, and the greater must be the weight it balances. The arc is generally graduated experimentally, the geometrical graduation being somewhat complicated.

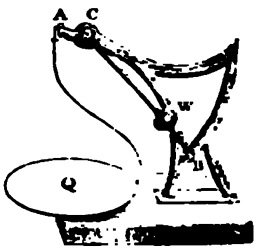

Fig. 4.

For other weighing apparatus, see SPRING-BALANCE; WEIGHING-MACHINES.

BA'LANCE AND BA'LANCE-SPRING. The balance of a watch is a wheel finely poised on its axis; the pivot-holes in which it turns being frequently—in chronometers and clocks, as well as in watches—jewelled, or made of small rubies, diamonds, &c., for the sake of durability. The natural effect of an impulse given to such a wheel would be a complete rotation on its axis. This, however, is convertible, by the escapement (q. v.) and by the balance-spring, into a vibratory motion. The balance-spring is held to be a crowning invention in the mechanism of the watch; and the honour of its first suggestion has been claimed for no less than three very eminent men—for Dr Hooke, an Englishman; for Abbé Hautefeuille, a Frenchman; and for Hüygens, the Dutch astronomer. The honour, however, undoubtedly belongs to Hooke.

The balance-spring consists of a coil of steel wire, so delicately manufactured that 4000 of them scarcely weigh more than one ounce, though often costing more than £1000. In its application to the balance of a watch, one of the extremities (*e*, fig. 1) of the spring is fastened to a point independent of the balance, while the other is attached near its axis. When the balance is at rest, the spring is inclined neither way, this

position being called the point of rest; but when the impulse is given to the balance by the crown-wheel of the escapement, the balance moves round just so far as the impulse given is able to overcome the elastic resistance of the spring. When that resistance becomes equal to the impulse given, the balance stops for a moment, and then is driven back by the elastic recoil of the spring, and continues thus to vibrate so long as the impulse is repeated or the watch is in motion.

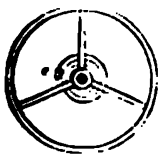

Fig. 1.

The recoil of the spring is sufficient to drive back the balance to a distance nearly double the length of its first motion; this is, therefore, called the long arc of vibration. But when the motion of the balance is free, with a certain length of spring, the *long* arc of vibration is made in less time than the short one, to which the impulse is given: with a spring of greater length this relation is reversed; whence it was concluded by Le Roy and Berthoud, that equality of time, or *isochronism*, in unequal vibrations, could be more easily obtained by lengthening the spring than by tapering it. In England, where time-keepers have been brought to their greatest perfection, it is considered that isochronism is most easily attainable by using the cylindrical helical spring (*s*, fig. 2), which is applied to all marine chronometers.

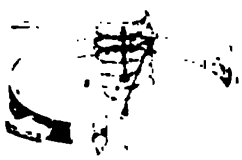

Fig. 2

An improvement in watches, or rather in chronometers, invented by Mr Dent of London, consists in coating the balance and balance-spring with gold by the electro-metallurgic process, by which means they are secured from rust.

BALANCE OF POWER, an expression used in diplomacy for that state of matters in which no one of the European states is permitted to have such a preponderance as to endanger the independence of the others. This idea is not, as some say, confined to modern times. The Greek states acted upon it by a kind of instinct of self-preservation, though it was not directly formulated. It has, however, become more distinctly avowed as a motive of political conduct, and more systematically acted upon, since the time of Charles V., whose overgrown power and ambitious designs awakened the other European powers to the danger of such overwhelming preponderance in one state. The motive of preserving the B. of P. came first distinctly into the force and in those unions which England, Holland, and Austria repeatedly formed against the menacing schemes of Louis XIV. for acquiring the dominion of all Europe. It was the same cause that broke up the most dangerous (for Louis) of these coalitions; for in the war of the Spanish Succession, when the Hapsburg pretender to the Spanish throne became, by the death of Joseph I., sovereign of Austria and Emperor of Germany, and the power which, in the hands of Charles V., had menaced the equilibrium of Europe, was thus likely to be again wielded by one man, England withdrew from the coalition, and thus saved Louis from a decided overthrow. The aggressions of Napoleon called all the powers of Europe to arms against him in the name of the B. of P.; and in readjusting the map of Europe, the B. of P. was often invoked to cover the jealousy which resisted not a few claims to restitution of itory. For some time, the B. of P. in Europe has been embodied, as it were, in a pentarchy or permanent congress of the five great powers, who mutually watch one another's movements. This mutual jealousy among the leading powers on the score of extension of boundaries, is looked to as the great safeguard of the smaller states, preventing their absorption by their powerful neighbours. It was the dread of a coalition against him that made the Emperor of Russia agree to the treaty of 1841, and the Crimean war arose out of Russia's renewed attempt to extend her dominion over Turkey. Latterly, the doctrine of non-intervention has to a certain extent gained ground among politicians; and the formation of the kingdom of Italy, the results of the Franco-German war of 1870, and the formation of the German empire, have modified the old ideas, and brought into play new combinations whose results can hardly yet be foreseen.

BALANCE OF TRADE. In the 'mercantile system' of political economy, which looks upon the possession of gold as the grand aim, it not unnaturally came to be a maxim that a nation becomes richer just in proportion as the money-value of its exports exceeds that of its imports; the excess, it was thought, being paid in gold, is just so much added to the national wealth. Now, the difference between the money-value of the exports and imports of a state is called the 'balance of its trade;' and by the adherents of the mercantile system, this balance was said to be 'in favour' of the country or 'against' it, according as the exports or the imports shewed the excess.

But this view of the matter rests on a twofold error; for, in the first place, the increase of national wealth is by no means to be identified with the immediate influx of hard cash; nor is gold the highest expression of national wealth, but only a means of turning real wealth and the faculty of labour to account. Further, the assumption that excess of exports represents excess of income, is completely false. It takes exports for income (because payment is received for them), imports for expenditure (because they must be paid for), while it would be more consistent with the truth to say that exports are identical with expenditure, and imports with income; so that wealth increases in proportion as the value of the imports (what is received) exceeds that of the exports (what is given away); and that whether these exports and imports consist solely of goods or partly of money. It may sometimes be desirable to get payment of exports in gold—that is, to import bullion. But the case in which this will be beneficial to the merchant trading on his own profit in the transaction, will be that in which it will be beneficial to the community. In the majority of cases, however, the individual merchant finds it his best policy to lay out the money due to him in a foreign country in purchasing the wares of that country as return-value. The far-sighted Venetians early recognised the truth of the principle in a national point of view; for, by a law of 1272, they laid a tax of one-fourth the value on the importation of all coined gold and silver. The mercantile system of political economy, on the contrary, consistently following up the notion of the B. of T., enacted laws prohibiting importation of foreign manufactures, or imposing high duties upon them, and giving premiums and other protective encouragements for exportation; as if it were possible to go on exchanging always for gold only, ever exporting goods and goods alone, and never importing any. If this could be, and if it were true that a nation with the B. of T. constantly in its favour must become richer, while, with that balance against it, it must become poorer, England, whose official

returns have for many years exhibited a large excess of exports over imports, must have had at this time about 500 million pounds in precious metals, while in reality the amount does not exceed perhaps 60 millions. The truth is, that no safe conclusion can be drawn from the B. of T. exhibited in official statements; from the way in which they are arrived at, a great part of the facts of the cases are necessarily left out. Almost all nations exhibit favourable balances, and how could that be possible, if the whole affair were not deceptive? In the regular legitimate commerce between two nations, both actually gain, though the gain may not be exhibitable in the form of a money-balance. If the gains of nations from commerce consisted of differences between the amount of exports and of imports to be compensated by balances in money, nearly all nations would be yearly receiving accessions of gold and silver, the united amount of which would exceed, by more than ten times, the produce of all the mines in the world.

BA'LANUS, a genus of *Cirrhopoda* (q. v.); the type of a family, including all those cirrhopods which are destitute of a flexible stalk, and of which the shell is symmetrical. These characters at once distinguish them from Barnacles (q. v.). In the genus B., the base is usually formed of a thin calcareous plate, the sides of six valves; and four small valves form the operculum, exactly closing the aperture at the top. The name (signifying an acorn) was originally given by the ancient Greeks, from a supposed resemblance of some of the kinds to acorns; and acorn-shell has sometimes been adopted as an English name. There are many species, and they are found in almost all seas, attached to stones, timber, shells, crustaceans, &c. They cover the rocks between high and low water-mark on many parts of the coast as with a white calcareous incrustation, so that arithmetic fails in computing, and imagination in conceiving their multitudes. They may, however, be readily passed over as individually objects of little interest when they are seen after the tide has left them, for then their valves are closed, and they exhibit no sign of life; but if observed in a pool of the rocks, or anywhere under water, they present a very different and extremely pleasing spectacle, the opercular valves continually opening and shutting with a quick but pretty regular motion, and an exquisitely delicate apparatus of feathery arms or cirrhi (see CIRRHOPODA) being as frequently thrown out and retracted like a hand or a little net, to seize and carry in to the mouth the minute nutritious particles or very small animals upon which the creature feeds. Thus, the little balani, immovably fixed to the rock, or carried about at the pleasure of mollusks or crustaceans to which they adhere, obtain their food from the waters around them.

A remarkable fact in the natural history of these creatures has recently been discovered by Mr Thompson of Cork, that in the earlier stages of their existence they are not fixed as in their adult state, but move about very actively in a succession of bounds, by means of swimming-feet like those of the *Cyclops* (q. v.); having, however, a shell, apparently of two valves, resembling a very minute muscle. Still more remarkable is the discovery made along with this, that in their early locomotive state they possess large stalked eyes, which disappear along with the organs of locomotion when they attach themselves—probably by the guidance of some peculiar instinct—to their final place of repose, undergoing a transformation into perfect cirrhopods, and acquiring as a covering their many-valved shell.

Some of the larger species of B. were esteemed a delicacy by the ancient Romans. The Chinese entertain the same estimation of *B. tintinnabulum*, which is said to resemble lobster in taste; and *B. psittacus*, a South American species, which is in like manner compared to crab, is exported in large quantities from Concepcion de Chili to Valparaiso and Santiago. This species is sometimes almost four inches in diameter, the height considerably more. It is chopped off the rocks with a hatchet. The two posterior opercular valves are beaked, from which it receives the name of *Pico*, and its scientific trivial name, *psittacus* (a parrot).

BALASO'RE, a seaport in the district of Cuttack and presidency of Bengal, near the Boorabalung, which enters the sea to the west of the Hoogly or Calcutta River. It is situated in lat. 21° 30' N. and long. 87° E., and has dry-docks and a coasting-trade; but it is entitled to notice chiefly in connection with the past, having been the seat, successively, of Portuguese, Dutch, and Danish factories. It was only in 1846 that the Danes sold their interest in the place to the English.

BA'LATON, LAKE OF (Platten-See), a lake, the largest in Hungary, about 55 miles south-west of Pesth. Its extreme length is 48 miles, with a breadth of from 3 to 10 miles, and an estimated area, including its frequently submerged marshes, of 420 square miles. Its greatest depth is 39 feet. It is supplied by upwards of thirty streams—the chief of which is the Szala—as well as by numerous springs which rise on its margin. Its outlet is by the Sio, which discharges itself into the Sarvitz, a feeder of the Danube. The waters of B. are clear and transparent, except when they are agitated by a storm, when they assume a bluish colour. They have a slightly brackish taste. Fish of various kinds are found in abundance, and sand impregnated with iron, interspersed with which are small garnets, rubies, and other precious stones, is taken from it. Woods and vineyards cover the hills which encircle its northern sides, and on its banks near the town of Füred there is a spring of acidulous water. The surrounding country is rich in rare plants and mineral treasures, and was the scene of several bloody conflicts during the Hungarian war (1848—1849). The lake itself figures prominently in the old romantic ballads of the Magyars.

BALAU'STA. See BERRY.

BA'LAY, or BA'LAIS, the name now used to distinguish the ruby of a bright rose-colour from the ruby proper, which is of a bright red or cochineal colour, and from the *spinelle* ruby, which is of a red hue approaching to rose-colour. This last kind of ruby has been recognised only in times which are comparatively modern. In the middle ages, they seem to have known only the B. ruby and the ruby proper, or *le beau rubis*, as it was often called. M. de Laborde thinks that the term B. was anciently employed as a name for all sorts of rubies.

BALBI, ADRIANO, well known by his geographical, and more especially by his statistical works, was born in Venice on the 25th of April 1782. In 1808 he gained so much credit in Italy by his first geographical work, that he was appointed Professor of Geography in the college of San Michele at Murano, and in 1811 Professor of Physics in the Lyceum at Fermo. Subsequently he resided for a time in Portugal, and then went to Paris, to superintend the publication of his *Essai Statistique sur le Royaume de Portugal et d'Algarve* (2 vols., Par. 1822). This work was soon followed by the *Variétés Politiques et Statistiques de la Monarchie Portugaise* (Par. 1822). B. lived in Paris till 1832. He was the intimate friend of Malte Brun, from

whose papers he, jointly with Larenaudière and Huot, published the *Traité Elementaire de Géographie* (2 vols., Par. 1830–1834). He also published several works of comparative national statistics. His *Atlas Ethnographique du Globe* (Par. 1826) is distinguished by its extensive accumulation of facts and views, giving an account of German researches on the subject, and entering into questions of comparative philology. B.'s best known work is, however, the *Abrégé de Géographie* (3d edition, Par. 1838), which has been translated into several languages. In the year 1832 he returned to Italy, and settled at Padua, where he died 14th March 1848. A collection of his *Scritti Geografici* was made by Eugene Balbi (5 vols., Turin, 1841—1842).

BALBI, Gaspard, a Venetian merchant of the 16th c., who is worthy of mention as the first traveller who has left an account of India beyond the Ganges. In the pursuit of his calling, B. was often led to Aleppo, and from thence, on one occasion, he made a visit to India, which lasted several years. After his return to Venice, he published, in 1590, the results of his travels in a volume entitled *Viaggio all' Indie Orientali*. A Latin translation was printed in De Bry's *Collection of Voyages and Travels to the East Indies*, published at Frankfort in 1590–1594. B. appears to have set down, without exaggeration, all that he himself saw, and is particularly minute and exact concerning commercial matters; but there is scarcely any limit to his credulity with regard to what he heard from others about the country. From Aleppo, his journey was down the Euphrates until opposite Bagdad; thence down the Tigris to Bassorah, where he embarked for the Malabar coast. Having visited Goa and Cochin, and other Portuguese settlements, he sailed for Pegu, then an independent empire, where he remained two years, returning by the same route. The most interesting part of his narrative is that relating to Pegu.

BALBINUS, Decimus Caelius, one of the two emperors of Rome whom the senate elected on hearing of the death of the elder Gordianus, and his son, in Africa, in opposition to Maximinus, who had the support of the legions in Germany. He was celebrated as an orator and a poet, and was a man of mild disposition. His coadjutor, Marcus Clodius Pupienus Maximus, was a bold and resolute soldier who had risen from the people. They had only reigned a few months, during which time Maximinus had been killed by his own soldiers, who afterwards submitted to Maximus, when they were both killed in 242 A. D. by the pretorians, who at that time were animated by bitter hostility to the civilians, and extended it to the rulers who had been elected by them.

BALBO, Cesare, an Italian statesman and author, was born 21st November 1789 at Turin. When 18 years old, B., whose father had enjoyed the patronage of Napoleon, was appointed auditor of the Council of State in Paris, and in 1812 he was made commissioner for the Illyrian provinces, ceded to France by the Peace of Vienna. After the fall of Napoleon, B. went to London as secretary of the Sardinian embassy. After leaving political affairs, he devoted himself to the study of history, and among other works produced during the years 1821–1843, were a *History of Italy*, which, however, extended only to the reign of Charlemagne; and a translation with commentary of Leo's *Development of the Constitution of the Lombardic Towns*. His *Speranze d'Italia* ('Hopes of Italy'), published in 1843, first extended his literary reputation to foreign countries. One of its main objects was to prove that national independence must precede the enjoyment of constitutional liberty; and that to strive after the latter, however good in itself, so long as the former had not been secured, was both foolish and reprehensible. It gave a vivid and intelligent picture of the political condition of Italy, its aims and prospects. His compendium of Italian history (*Della Storia d'Italia*, &c.) was also successful. B. took a prominent part as a moderate liberal in the political movements of 1847–1848, and subsequently supported the ministry of Azeglio. He died 3d June 1853. He was a man of strict morality and unspotted character. In all his writings, B. adhered strongly to the Roman Catholic Church, whose truth he conceived to be the healing of nations as well as of individuals, and the only source of true culture.

BALBOA, Vasco Nunez de, a Spanish conqueror, was born of a noble but reduced family at Xeres-de-Caballeros in 1475. After leading rather a dissolute life in his youth, he gladly took part in the great mercantile expedition of Rodrigo de Bastidas to the New World. He established himself in St Domingo, and began to cultivate the soil; but fortune proving adverse, in order to escape from his creditors, he had himself smuggled on board a ship, and joined the expedition to Darien in 1510, commanded by Francisco de Enciso. It is curious to reflect that the man destined to discover the eastern shores of the largest ocean on the globe, should have been compelled to secret himself in a cask before he could share in the new enterprise. An insurrection which took place obtained for B. the supreme command in the new colony. Confused accounts which reached him of a great western ocean, impelled him, in 1513, to set out in quest of it. On the 25th of September of this year, he obtained the first sight of the Pacific Ocean from a mountain-top in the Isthmus of Panama. His natural enthusiasm at this great discovery was shared by all the educated men of his time, and the descriptions of it by contemporary authors may still be read with much interest. The governorship of the territories conquered by B. was obtained in 1514 by Pedrarias Davila, by means of his intrigues at the Spanish court. B. resigned the command into the hands of the new governor, a narrow-minded and cruel man, and, in a subordinate situation, undertook many successful expeditions; but these, and all his other merits, only served to increase the hatred of Pedrarias Davila towards him. The government of the mother-country sought in vain to mediate between them, and B. even married the daughter of Pedrarias. But on the first occasion of dispute which arose, B., having been induced by Pedrarias to deliver himself up, was accused of a design to rebel, and in violation of all forms of justice was beheaded at Santa Maria in 1517.

BALBRIGGAN, a small maritime town in Dublin county, 22 miles north of Dublin. It is a seat of cotton, calico, and stocking manufactures. The cotton stockings made here are remarkable for fineness of texture and beauty of open work. Many females are employed in embroidering muslins. B. is a favourite watering-place. After the battle of the Boyne, William encamped here. Pop. (1871) 2332.

BALCONY, or **BALCONY** (Ital. Balcone), a projecting gallery in front of a window or of several windows, with a balustrade or parapet before it, and supported by consoles, or brackets fixed in the wall, or by pillars resting on the ground below. The B. was unknown in Greek and Roman architecture, and is probably an Italian contrivance, as the earliest examples of it occur in Italy, to the climate of which country it is peculiarly adapted. Balconies constructed of wood are of constant occurrence in the

cottage architecture of Switzerland, to the picturesque character of which they add very essentially.

Balcony.

BALCONY, the gallery or stern-walk outside the stern of a large ship. Three-deckers have two such balconies, and two-deckers one. Where there are two, the lowermost is connected with the admiral's state-cabin, and the uppermost with the captain's cabin.

BALDACHIN (Ital. *Baldachino*), signifies a kind of canopy, of the form of a tent or umbrella, made of costly materials and richly adorned, which is either supported on pillars, or fastened to the wall over a throne or couch, or over a pulpit, an altar, or other sacred object. One of the most celebrated is the B. in the church of St Peter's in Rome, cast in bronze by Bernini, which is supported on four large twisted columns. B. was also the name formerly given to a kind of umbrella of a square form, made of silk brocade or other rich material, and supported on four poles, which was wont to be carried in the middle ages at solemn processions, coronations, marriages, &c., over the heads of royal personages or high dignitaries as a symbol of their rank. In Europe, the B. is now chiefly used in the processions of the Roman Catholic Church. It is generally borne over the priest who carries the Host. The word B., as well as the thing itself, comes from the east. Partly as a protection from the burning rays of the sun, partly as a symbol of their power and dignity, the rulers and great personages of the east seldom appeared in public, whether on foot or on horseback, in a litter or on an elephant, without a splendid canopy, often borne by the great men or chief officers of their kingdom. These canopies, generally made in the form of a tent or umbrella, were often sent, in the early part of the middle ages, as presents from eastern princes to those in the west; as, for example, from the Calif Harun-al-Raschid to Charlemagne. During the Crusades, and the consequent trade with the east, they became well known to the Italians. Such canopies, as well as the rich stuffs of which they were made, were called, from the land whence they came, Babylonica; and also Baldachins, from Baldach, the east rn name of the city of Bagdad.

BALDER, or **BALDUR**, a divinity worshipped by the ancient Scandinavians, and probably also by the other Germanic nations, is the hero of one of the most beautiful and interesting of the myths of the Edda. B., who, according to old northern mythology, was the second son of Odin and Frigga, and the husband of Nanna (maiden), dreamed evil dreams which threatened his life. When he related them to the gods, they held a council and endeavoured to secure his safety. Frigga took an oath from fire and water, from iron and all metals, from stones, earth, and plants, beasts and birds, the serpent, poison and all diseases, that they would not harm Balder. After this was done, the gods in their mirth sported with B., wrestled with him, and cast darts at him, but nothing could injure him. While the gods rejoiced at this, the thing displeased Loki (mischievous cunning or destructive fire). He changed himself into the form of an old woman, and inquiring the cause of the invulnerability of B., was told by Frigga that all things, animate and inanimate, had sworn not to harm him, with the exception of one little shrub, the mistletoe. Loki went in haste to fetch this shrub, and repaired with it to the assembly of the gods, where he placed it in the hands of the blind Höder, the god of war, directed his aim, and B. fell pierced to the heart. The sorrow of the gods was unutterable. Frigga asked who, to win her favour, would journey to Hel—the goddess of Hades or the grave—to release Balder. Hermoder or Helmod (the heroic), the son of Odin, readily offered his services, and Hel consented to grant his request on condition that all things should weep for Balder. All men, all living beings, and all things wept, save the witch or giantess Thöck (the step-daughter of Loki), who refused to sympathise in the general mourning. B. was therefore obliged to remain in the kingdom of Hel until the end of the world.

The myths of B. have been very differently interpreted. B., as the originator of all that is beneficent and good—for B. and the other sons of Odin (see SCANDINAVIAN MYTHOLOGY) are only personified aspects or functions of the dimly conceived one unseen Power that moves all nature—is represented as a hero of so lovely and graceful a manly beauty, that a brilliant light streams from his person; the whitest of the northern flowers is named *Balders-brow*. As the god of peace of the Germanic nations, who conducts to peace through battle and victory, he is a purely ethical conception, a mythical personification of the peace obtainable through conflict, and agreed to by compact among the gods. The gods, foreseeing doubtless that peace cannot long endure, seek in every possible way to secure the precious life of B., as even the weakest and most insignificant have it in their power to destroy peace. Loki, in his symbolical character as the god of retributive justice, stirs up Höder, or War, through whom the god of peace falls. Höder, indeed, is also slain by Wali, or Val-fader, the battle-god, and the war is ended by a bloody overthrow; but once violated and broken, peace is irrevocably lost along with Balder. Hermoder or Helmod labours in vain to restore it, for the giantess Thöck (retaliation, revenge) prevents it. Holy and true peace can only revive again in a new world, when the old sinful world and the old guilt-stained gods now ruling it shall have been destroyed.—Others (among them Max Muller) see in the myth of B. a representation of the contest between Winter and Summer. Compare Weinhold *Die Sagen von Loki*, in Haupt's *Zeitschrift für Deutsches Alterthum* (Leip. 1849).

BALDNESS (*alopecia*). See HAIR. There are some rare cases on record in which the hair has never been developed. This is termed congenital *baldness*.

Accidental baldness may involve the whole scalp

ay be only in patches; these patches may run each other, and hence some consider this con- a species of ringworm. It is caused, says Erasmus Wilson, by an atrophy of the hair-les (q. v.). B. in the comparatively young and le-aged may occur from wearing waterproof which, by preventing evaporation from the occasion an unhealthy state of skin. Naval itary officers are liable to B. arising from this

ile baldness (calvities) is not necessarily consequence of age—it may arise, like the ding variety, from an atrophy of those parts hich the hairs depend for nutrition. It gener- commences on the crown of the head, where mmly of blood is naturally less abundant. have a greater quantity of soft tissue under , therefore the vessels are less likely to be d with; hence they are not so frequently n.

e causes of B. are the defective supply of tion just mentioned, a family tendency, late , dissipation, but especially old age. The hair off after severe illnesses, or after other causes neral debility. During pregnancy the hair falls and in this country we often see the long hair oung women, victims to consumption, almost letely shed.

eatment of baldness consists in attention to s, and in exciting the languid circulation scalp to greater activity, by using a hard rush, and the application of stimulants, as Spanish-fly ointment in the proportion of two ms to an ounce of lard mixed with about the quantity of pomatum. Or the stimulants may plied in the form of lotions. But at the same constitutional debility should be remedied by tion to the various functions of the body; s should be administered; and, if possible, s of anxiety or night-watching should be ed. Shaving the whole head is sometimes ted to. If these remedies are successful, downy hair, like that of an infant, begins to grow, may or may not acquire the colour and ous appearance of the former growth.

LDO, Mo'nte, a mountain of Lombardy, on ast of Lake Garda, with an elevation of 7100 It contains interesting petrifactions, and the sand known as the sand of Verona.

LDRICK, or BAU'DRICK (Fr. *Baudrier*), band or sash worn partly as a military and

Baldrick.

y as a heraldic symbol. It passes round the t as a girdle, or passes over the left shoulder, s brought down obliquely under the right arm, suspended from the right shoulder in such y as to sustain a sword. Many of the effigies nights contain representations of the B., more frequently as a belt than a shoulder-sash. Queen Victoria frequently wears a blue silken B. on state occasions. The name is derived from the *balteus* of the Roman soldier.

BA'LDUNG, Hans, called also Hans Grün, a German painter and wood engraver, a contemporary of Albert Durer, to whom, in expression, colouring, and finish, he was little inferior as a painter. He was born in Gmünd, Swabia, about 1470, and died at Strasburg in 1552. His master-piece, a painting of the Crucifixion, is in the cathedral of Freiburg; his wood engravings are numerous.

BA'LDWIN I., the first Latin emperor of Constantinople, was born at Valenciennes in 1171 A.D., his parents being Baldwin, Count of Hainault, and Margaret, Countess of Flanders. In 1193, he succeeded to his mother's possessions, and in the year following, to the title and county of his father. In 1200, he appointed his brother Philip, along with other persons, to the regency of Hainault and Flanders, and joined the fourth Crusade. Part of the Crusaders B. among others—were induced to assist the Venetians in reconquering Zara, in Dalmatia, from the king of Hungary. While at Zara, the young Alexis, son of Isaac II., emperor of Constantinople, craved the assistance of the Crusaders against his uncle Alexis Angelus, who, having deposed and blinded Isaac II., had usurped the throne. In return for their aid, he promised them a liberal sum of money, and also to help them to recover Palestine. The Crusaders agreed, and soon defeated the usurper's forces, and restored the rightful emperor; but Alexis having some difficulty in carrying out his promises, they turned their arms against him. A revolution breaking out in the city at the same time, Alexis the younger was murdered, and his father is said to have died of grief. Alexis Ducas Murzuphlus then usurped the throne, but was defeated by the Crusaders, and the city was sacked—the Crusaders and Venetians sharing the booty. B. was chosen emperor, and crowned on the 9th May 1204; but he received only about a fourth part of the empire—Constantinople and Thrace—the Venetians obtaining the greater share of the provinces. A part also fell to the French adventurers who accompanied the expedition, and several provinces remained in the hands of Greek princes. The abilities of B.—and they appear to have been of a superior character—were not able to cope with the evils necessarily attending so anomalous a position. The Greeks were discontented, and, backed by Calo-Joannes, king of Bulgaria, while B.'s brother, with the flower of his troops, was away on an expedition in Asia, they rose and massacred the Latins scattered throughout the towns of Thrace, and made themselves masters of Adrianople. B. laid siege to the town with the forces he had at his disposal; but he was defeated and taken prisoner by the Bulgarian king, and died about a year after (1206) in captivity. He was succeeded by his brother Henry.

BA'LDWIN II., emperor of Constantinople, was born in 1217. He was the son of Peter de Courtenay and Yolanda, Countess of Flanders, sister of Baldwin I. Being but 11 years old when, by the death of his brother Robert, he succeeded to the throne, he was placed under the guardianship of John of Brienne, titular king of Jerusalem, who died about 1237. B. then assumed the rod of empire, but he had neither the means nor the ability to wield it successfully against his powerful Greek and Bulgarian opponents. Two beggingvisits to Western Europe, in one of which he left his son Philip in pledge at Venice for a

debt, and disposed of several most holy relics for money, were not successful in procuring him sufficient forces to resist his foes; and on the night of the 15th of July 1261, his capital was taken by one of the generals of Michael Palæologus, ruler of Nicæa, and B. fled to Italy. With him terminated the Latin Empire in the East, after it had lasted 57 years. His descendants for more than a century retained the title of emperor.

BALDWIN I., king of Jerusalem, 1100—1118, was born in 1058. He was the youngest brother of Godfrey de Bouillon (q. v.), Duke of Lower Lorraine or Brabant. He took part in the first Crusade; but having quarrelled with Tancred, he retired to Edessa, at the request of the Christian inhabitants of the place, and was soon after elected to be Count of Edessa. After the death of his brother Godfrey, in 1100, he became Protector of the Holy Sepulchre, and Baron of Jerusalem, and immediately assumed the regal title, which his brother had refused. He conquered Cæsarea, Ashdod, and Tripolis, and with the assistance of a Genoese fleet, he became master also of Acre, and subsequently of Sidon, but failed to reduce Ascalon. He died in 1118. Unlike his brother, who was a disinterested enthusiast, B. was worldly and ambitious.—BALDWIN II. (Baldwin du Bourg), cousin of Baldwin I., who had made him Count of Edessa when he ascended the throne of Jerusalem, succeeded him, and reigned from 1118 to 1131. During his reign Tyre was taken, in 1124, with the assistance of a Venetian fleet; and the order of the Templars was instituted. Having been taken prisoner by the Turks, B. endured a captivity of six months. He died on the 21st of August 1131, leaving four daughters. Shortly before his death he resigned the crown in favour of his son-in-law, Foulques of Anjou, who reigned till 1134.—BALDWIN III., king of Jerusalem, 1143—1162, the son and successor of Foulques of Anjou, was born in 1129. He was a model of knighthood, which, during the period of the first Crusades, was a personification of Honour, Justice, Devotion, and Love. Edessa was lost to the Christians during his reign. In 1152, he fought victoriously at Jerusalem against Noureddin, the sultan of Aleppo. In 1157, after he had defeated the same prince at Jacob's Ford, on the Jordan, he again humbled him severely near Putaha. After this, he ruled in peace, and endeavoured to improve both the external and internal defences of his kingdom. The authority and influence of B. were so great, that even Saracens followed under him the banner of the Cross. By his marriage with Theodora, the daughter of the Greek Emperor Manuel, he gained a faithful ally in that prince. He died, it is believed, of poison, in the flower of his age, at Tripolis, in Syria, on the 10th of February 1162. With his death the Christian power in the east began to decline. He was succeeded in the government by his brother Amalric or Amaury, who died in 1173.—BALDWIN IV., the son and successor of Amalric, surnamed the Leper, reigned till 1183.—When a child of 5 years old, BALDWIN V., the son of Sybilla, sister of Baldwin IV., was called to the throne. He died in 1187, a year before Jerusalem was retaken by Saladin.

BALDWIN'S PHOSPHORUS is a term applied to the nitrate of lime, which, on evaporation, parts with its water of crystallisation, and then, as discovered by Baldwin in 1675, assumes a luminous appearance in the dark.

BALE, JOHN, Bishop of Ossory, in Ireland, was born at the village of Cove, in Suffolk, in November 1495. He was educated as a Carmelite monk, but afterwards turned Protestant, and, being persecuted by the Roman Catholics, fled to Flanders, where he remained eight years, during which he wrote numerous works. He was recalled by Edward VI., and successively presented to the living of Bishopstoke, in Hampshire, and the bishopric of Ossory. In this latter sphere he made himself so obnoxious to the Catholics by his zeal in the Protestant cause, that on news of the death of Edward, his house was attacked, and five of his servants killed. He himself escaped out of the country after great difficulty, and the loss of all his effects. On the accession of Elizabeth he returned to England, and was made a prebend in the Cathedral of Canterbury. He died in 1563. His fame mainly rests on a collection of British Biography, which, notwithstanding that sections of a book are not unfrequently set down in it as distinct works, and that the names of persons who never wrote anything are set down as authors, is a valuable work. It was first published in 1548 under the title of *Illustrium Majoris Britanniæ Scriptorum, hoc est, Angliæ, Cambriæ, et Scotiæ Summarium.*

BÂLE. See BASEL.

BALEA'RIC ISLES, a group of five islands—Mallorca (Majorca), Minorca, Iviza, Formentera, Cabrera—lying off the coast of Valencia, in lat. 38° 6′—40° 5′ N., and long. 1°—5° E. They at one time formed the kingdom of Mallorca, which was united in 1289 with the crown of Aragon. They now form a Spanish province, and have unitedly an area of 1753 square miles, with a population, in 1867, of 284,398. The soil generally is good. Vines, olives, and other fruit-trees are cultivated abundantly; but corn has to be imported. The coasts are precipitous, with some excellent harbours—Port Mahon, in Minorca, being one of the finest in Europe. The Phœnicians visited the B. I. at a very early date, and they were followed by the Greeks, from one or other of whom they are said to have received their name. If from the Phœnicians, the name is derived from a Phœnician word equivalent to the Greek *gymnetes*, signifying light-armed troops; if from the Greeks, then it is from *ballein*, to throw, and was given because of the expertness of the natives in using the sling, to the use of which they were trained from their infancy. Later, the B. I. became subject to Carthage; but after a short period of freedom, during which their inhabitants became pirates, were annexed to the Roman empire by Metellus (*Balearicus*), 123 B.C. From that time their history is involved in that of the peninsula. See SPAIN.

BA'LE-FIRE. See BEACON.

BALFE, MICHAEL WILLIAM, an English composer of operas, &c., was born May 15, 1808, in Dublin. His musical talent received early culture, and several anecdotes are related of his singular precocity. When only seven years old, he played publicly one of Viotti's concertos for the violin. At nine, he wrote the ballad entitled *The Lover's Mistake*, which achieved popularity through the singing of Madam Vestris. At sixteen, he made his début in London, at the Drury Lane Theatre, as conductor of the orchestra. In 1825, he left this situation, in order to visit Italy, where he studied counterpoint under Frederici at Rome, and singing under Filippo Galli at Milan, and began his successful career as a composer, with music for the ballet *La Pepiera*, performed at the Theatre La Scala, in Milan. In 1827, he returned to the stage, and sang in the Italian Opera at Paris, where in concert with Malibran and Sontag, he gained great applause, and

many warm friends. He, however, returned to Italy, and devoted himself to composition, producing in rapid succession the operas *I Rivali* (1830), *Un Avventimento* (1832), *Enrico IV.* (1834), *Assedio di La-Rochelle* (1835), *Manon Lescaut* (written for Malibran, 1836), *Catharine Grey* (1837), *La Dame Voilé* and *Falstaff* (1838), *Jeanne d'Arc* (1839), *Keolanthe* (1840), *The Bohemian Girl* (1844), *Les Quatre Fils d'Aymon* (1845), *L'Etoile de Seville* and *The Rondman* (1847), *The Maid of Honour* (1848), *The Sicilian Bride* (1852). More classical than any of these operas, and more permanently successful than any except *The Bohemian Girl*, was *The Rose of Castille*, produced in London in 1857. It was followed by *Satanella*, *The Puritan's Daughter*, *Blanche de Nevers*, and *The Sleeping Queen*, the last written in 1864. Balfe died October 20, 1870. If not a very original writer, he had a very thorough knowledge of effect and command of orchestral resources; and his compositions are distinguished by fluency, facility, and melodic power. His daughter, Mdlle. Victoria Balfe —now Duchess of Frias in Spain, was for some years a very acceptable public singer both in England and on the continent.

BALFOUR, Sir James, Lord President of the Court of Session, and author of an able book, *Practicks of Scots Law*, was a son of Sir Michael Balfour of Pittendreich and Montquhany, in Fifeshire. In early life he was implicated in the conspiracy against Cardinal Beaton, and being in the Castle of St Andrews when it surrendered, in 1547, he was carried prisoner to France in the same vessel with John Knox. About two years after, returning to Scotland along with other of his fellow-prisoners, he changed his religion, his apostasy gaining for him the appellation of the 'Blasphemous Balfour' from Knox, but unusual honours and emoluments from the queen and court. B. was sagacious enough to notice the increasing influence of Bothwell, and he immediately insinuated himself into his confidence, joined the conspiracy for the assassination of Darnley, and framed the bond for mutual support, signed by the conspirators. He was afterwards accused by Lord Lennox as an accomplice in the murder of Darnley, but the trial was hurried over before proof of his guilt could be brought forward. In 1567, at the instance of Bothwell, he was appointed governor of Edinburgh Castle; and he repaid the kindness of that nobleman and the queen, by handing over to the confederate lords the celebrated letters upon which they endeavoured to found Mary's guilt, and which had been given him by Bothwell for safe custody. He afterwards surrendered the castle to Murray, on certain conditions, in which his own safety and interests were the chief considerations. The great object of B.'s life appears to have been self-aggrandisement, without regard to the means by which that was accomplished. Accordingly, we find him the recipient of favours under the regency, as he was under the queen. He was made a privy-councillor, Commendator of the Priory of Pittenweem; and in exchange for the clerk-registry, he received the Lord Presidentship of the Court of Session, and a pension of £500. When Morton was made regent, B. contrived to curry favour with him, and received from him a commission to make a general digest of the law. Not feeling himself safe in Scotland, however, he left it for France, where he remained for some time. When the young king ascended the throne, he joined the party hostile to Morton, but again fled to France, when in 1579 Morton recovered his authority. In 1580 he returned, and was instrumental in obtaining Morton's death, by producing the deed compassing the murder of Darnley, which that nobleman, along with others, had signed. He died in 1583.

BALFRU'SH (or more correctly BARFURU'SH, 'mart of burdens'), an important commercial town in the Persian province of Mazanderan, and situated on the river Bahbul, about twelve miles from its mouth in the Caspian Sea. The river, which is here about fifty yards broad, but shallow, is crossed by a fine stone-bridge of eight arches. It is not navigated, all goods being landed at the port of Mesh-hedi Ser, on the Caspian, from whence they are conveyed to B. by an excellent road. To the south of the town there is an artificial island, about half a mile in circumference, on which the palace of Shah Abbas formerly stood. B. has excellent bazaars, and several Mohammedan colleges; the population is variously estimated at from 50,000 to 200,000. The latter estimate was made by Fraser, who visited it in 1822, since which time it has been greatly depopulated by plague and cholera. Flax and cotton are much cultivated in the vicinity.

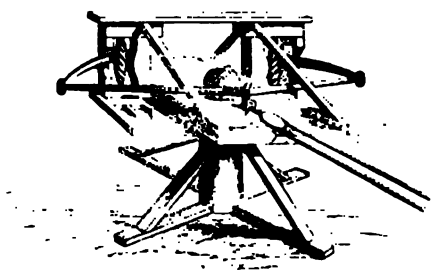
BA'LI, or BA'LLY, an island to the east of Java, about 70 miles long by 35 broad. With an area of 1500 square miles, it contains a population of about 700,000, being 466 inhabitants to a square mile. It is said to differ from the other islands of the Indian archipelago in shewing a majority of Hindus and a predominance of Hinduism. Like the islands generally in every section of the archipelago, from the Philippines to Sumatra inclusive, B. is volcanic —its highest mountain, with an elevation of 11,326 feet, having been an active volcano as late as 1843. The Dutch have a settlement in Badong, the chief of the eight states into which the island is subdivided, and many Chinese are to be found in the seaports. The lat. and long. of Badong harbour are 8° 42' S., and 116° 33' E.

BA'LIOL, John, Lord of Galloway, and afterwards King of Scotland, was born in 1259, and on the death of the Princess Margaret in 1290, became a competitor for the crown of Scotland. As the grandson of the eldest daughter of David Earl of Huntingdon, brother of William the Lion, his claim was pronounced superior to that of the other principal competitor, Robert Bruce, Lord of Annandale, son of the second daughter. The arbiter on the occasion was Edward I. of England, who found this a fit opportunity for asserting his claim as lord-paramount of Scotland. That claim was acknowledged by the Scottish estates in submitting the contest to his decision; and, consistently with this ignominious submission, B., before and after receiving the crown (November 30, 1292), swore fealty to Edward as his feudal superior. He was soon made to feel that his sovereignty was merely nominal, and, abject as he had shewn himself, the indignities which he experienced at length roused him to an assertion of his rights as king. In 1295 he took upon him, by the advice of his nobles, to conclude an alliance with France, then at war with England. This act of revolt was followed by speedy chastisement. Edward invaded Scotland with a large force; defeated the Scottish troops; took B. prisoner, and compelled him, after performing a humiliating penance, formally to surrender his crown, July 2, 1296. B. was confined for three years in the Tower, enjoying, however, a limited freedom, and something of royal state. At the end of that time he was permitted to retire to his patrimonial estates in Normandy, where he died in 1314, a short time after the battle of Bannockburn. The estimate by his subjects of this unfortunate and poor-spirited prince was significantly indicated by the surname of 'Toom Tabard,' or Empty Jacket.

BA'LIOL, Edward, son of John, makes himself

momentarily conspicuous in history by his daring and successful invasion of Scotland, then under the regency of Randolph, Earl of Moray, in 1332. Accompanied by some English noblemen bent on recovering their forfeited estates in Scotland, he landed with a few hundred followers at Kinghorn, in Fifeshire; defeated the Earl of Fife; pushed boldly into the country; and on Dupplin Moor, in Perthshire, routed with immense slaughter an army upwards of ten times more numerous than his own. On the 24th of September, seven weeks from the date of his landing, he was crowned king of Scotland at Scone. He had only enjoyed the kingly dignity for about three months, when he was surprised in his camp at Annan, and nearly lost his life as well as the crown he had so recently assumed. His subsequent career is the very reverse of what might have been anticipated from so adventurous a beginning, being marked only by weakness, servility, and misfortune. He died at Doncaster in 1363, and with him ended the house of Baliol.

BALI'STA, or **BALLI'STA** (Gr. *ballein*, to throw), was one among the larger kinds of military weapons in use before the invention of gunpowder. The *B.*, the *catapulta*, the *scorpion*, and the *onager*, propelled large and heavy missiles, chiefly through the reaction of a tightly-twisted rope of hemp, flax, catgut, sinew, or hair; or else by a violent movement of levers. The scorpion was a kind of large crow-bar; the B. threw stones; the catapulta threw heavy darts or arrows, and was somewhat smaller than the Balista. One man could manage the scorpion, but two or more were needed for the B. or the catapulta. There was a good deal of mechanism necessary to bring about the propulsive force. The makers of



Balista.

those machines were very particular in the choice of women's hair, the sinews of a bull's neck, and the tendons of the deer, wherewith to fashion the elastic cord. The onager was a kind of B., which threw a stone by the agency of a sling instead of a stretched cord. The early chroniclers tell of catapultas that would throw an arrow half a mile, or hurl a javelin across the Danube; and of a B. which threw a stone weighing 360 lbs. Numerous other weapons of an analogous character were known in the middle ages—such as the *mangonel*; the *trebuchet*, which threw a large stone by the action of a lever and a sling; the *petrary*, which (as its name implies) threw a stone; the *arbinet*, which threw darts as well as stones; the *mate-griffon* and *mate-funda*, both slinging-machines; the *trivelle*, which hurled quarrels, or square-headed arrows; the *espringal* or *springal*, which threw large darts; the *ribaudequin*, a large kind of cross-bow; the *war-wolf*, a stone-throwing machine, &c. The Arbalest (q. v.) may be regarded as a small portable arrow-throwing Balista.

BALI'STÉS, or **FILE-FISH**, a genus of osseous fishes of the order *Plectognathi* (q. v.) of Cuvier; the type of a family, *Balistidæ*, the species of which are almost all inhabitants of tropical and seas, frequenting rocky coasts and coral-reefs colours are generally brilliant. The body is ably compressed. The ossification of the sk as in the other Plectognathi, is very incomple the external covering of the body resembles the Ganoid (q. v.) fishes, consisting, in some genera, of large rhomboidal scales, dispo regular rows, and not overlapping; in others,

Balistes conspicillum.

small rough scales, with stiff bristles, crowded as the pile of velvet. But the most resting thing in connection with these fishes, provision for fixing the first dorsal spine in a position, or lowering it at the will of the The spine is articulated 'by ring and bolt broad interneural osseous plate.' 'When the is raised, a depression at the back part of it receives a corresponding projection fr tiguous base of the second ray, which the hammer of a gun-lock at full cock, an be let down until the small spine has been as by pulling the trigger; it is then rece groove on the supporting plate, and offers ment to the progress of the fish through This trigger-like fixing of the spine takes in the dead fish; and when a B. is removed fr bottle for examination, it is generally neces release the spine by pressing on the small ray.' The spine is roughened with enamel whence the name File-fish. The flesh of these is generally regarded as unwholesome.

BALISTRA'RIA (Ital. *Balestriera*), one names given to those narrow apertures so often seen in the walls of old castles, and through which the cross-bowmen discharged their arrows. See BALISTA. B. do not seem to have come into use till the 13th c. The lower terminations of B. are generally circular, sometimes in the form of a shovel. See LOOPHOLES.

BALIZE, BELIZE, or BRITISH HONDURAS, a British colony on the Bay of Honduras, in the Caribbean Sea, extending in N. lat. from 16° 45' to 18° 30', and from 88° 10' to 89°. It forms the so the peninsula of Yucatan, which has Caribbean Sea from the Gulf of Mexico is 3500 square miles. In 1870, the was 24,710—377 white, and 24,333 nearly half of the whole being in which stands at the mouth of a river

name. In addition to the Belize, which crosses the middle of the country, the Rio Hondo and the Siboon form respectively the north-west and the south-east boundaries. The presence of the British in this neighbourhood was naturally enough the object of jealousy to the Spaniards, being long tolerated from necessity, but formally sanctioned only in 1783. Besides teeming with tropical products in general, B. exports mahogany, cedar, sarsaparilla, logwood, fustic, and other dye-woods. The town is a depôt of British goods destined for Central America, and the river is said to be navigable for 200 miles from its mouth.

BALKAN, or **HEMUS**, the eastern branch of the mountain-system which comprehends the ranges of Montenegro, Herzegovina, and the Dinaric Alps. It extends from the plain of Sophia to Cape Emineh, on the Black Sea, and forms the southern boundary of the basin of the Danube. The B. range runs almost parallel with the Danube, and for about five degrees of latitude divides Bulgaria from Rumelia. Culminating in the west in the peak of Tchardagh, 7700 feet high, it decreases gradually in elevation as it approaches the Black Sea on the east, loses, to some extent, its wild bare character, and becomes intersected with valleys and wooded slopes. This part of the B. has great strategical importance. Various offsets traverse western Bulgaria and Rumelia. The B. is traversed by five or six passes, the only important one of which is called Porta Trajani, and forms the line of communication between Vienna and Constantinople.

BALKA'SH, or **TENGIZ** (Tenghiz or Tenguiz), a lake of Central Asia, on the north-west borders of Eastern Turkistan, lat. 44 and 47 N., long. 77 and 82 E. Its length is stated at 150 miles, and its greatest breadth at 75 miles. Its principal feeder is the river Ili. It has no outlet.

BALKH, formerly the most northerly province of Afghanistan, is now subordinate to the khanate of Bokhara, though not incorporated with it. It corresponds to ancient Bactria, and lies between lat. 35° and 37° N., and long. 64° and 69° E. It is bounded on the N. by the river Oxus, on the E. by Budukshan, on the S. by the Hindu-Kush, and on the W. by the Desert. Offsets of the Hindu-Kush traverse it in a north-west direction, and slope down to the low steppes of Bokhara. Its length is 250 miles; its breadth, 120. Its situation was once important during the overland commerce between India and Eastern Europe before the sea-route by the Cape of Good Hope was followed. The soil has the general characteristics of a desert land; only a few parts are made fertile by artificial irrigation; and such are the vicissitudes of climate, that where grapes and apricots ripen in summer, and the mulberry-tree permits the cultivation of silk, in winter the frost is intense, and the snow lies deep on the ground. The natives are Usbek Tatars; and their character seems to depend very much on that of the country. In the barren regions, they are simply plunderers of caravans; in the more favourable ones, they are peaceful nomades; and in the most prosperous districts they are tillers of the soil, and artisans in towns and villages. Pop. estimated at about 1,000,000.

BALKH, the chief town, 23 miles from the Amu, is situated where the Rudi Baaj is distributed in numerous canals. It is surrounded by a mud wall; but though bearing the imposing title of Amu al Bulad ('mother of cities'), it has little of the grandeur of ancient Bactra, on the site of which it is built. It was twice destroyed by Genghis Khan and Timur; and as late as 1825, it was plundered by the powerful ruler of Kunduz, Mir-Murad Beg. The neighbourhood is famous for its corn and fruits. As a boundary town between Afghanistan and Bokhara, B. assumed a prominent position in the British-Afghan war. Pop. 2000.

BALL. Games with balls were among the most favourite gymnastic exercises of the ancients. They were played almost daily by all, young and old; by the highest statesman equally with the lowest of the people. The Greeks prized the game as a means of giving grace and elasticity to the figure, and erected a statue to one Ari-tonicus for his skill in it. The effeminate Maecenas amused himself during a journey by playing B., as we learn from Horace. In the gymnasia of the Greeks, and in the Roman baths, there was a special compartment for B.-playing (*sphaeristerium*), where certain rules and gradations of the exercise were to be observed according to the state of health of the player. The balls were of very various kinds; they were generally of leather, and filled with air; others were stuffed with feathers. Ornamented balls, composed of 12 differently coloured segments (such probably as are to be seen in modern toy-shops), are mentioned in Plato's *Phaedon*. There was also great variety in the kinds of game, each having a name. In one, the B. was thrown up, and the players strove who would catch it as it fell; another was the same as our football; in a third, a number of persons threw it at one another, either with a view to hit, or for the B. to be caught and returned; in a fourth, the B. was kept rebounding between the earth and the palm of the player's hand as often as possible.

Ball-playing seems to have been of equal antiquity in the west of Europe, and to have come down uninterruptedly to modern times. In the 16th c., it was in great favour in the courts of princes, especially in Italy and France. The French *jeu de paume*, and the English *Tennis* (q. v.), are often mentioned. Houses were built for playing in all weathers; and in gardens and elsewhere long alleys were laid out for the purpose, the names of which still adhere to many localities. The B. was struck with a mallet. It. *maglio*; Fr. *mail* or *maille*; Eng. *mall*. The mallet was also called by the compound name *pall-mall*, *pell-mell*, or *pall-mall*, from It. *palla* (Lat. *pila*), a ball. The same names signified also the game or the alley where it was played; hence the English Malls and Pall-Malls. The game is thus described in *Blount's Glossographia*, quoted in Cunningham's *Handbook of London*:

'Pale Maille (Fr.), a game wherein a round bowl is with a mallet struck through a high arch of iron (standing at either end of an alley), which he that can do at the fewest blows, or at the number agreed on, wins. This game was heretofore used in the long alley near St James's, and vulgarly called Pell-Mell.'

Towards the end of the 18th c., the game of B. ceased to be played at courts, and at the same time went out of fashion in the higher circles of continental society, though it is still practised by the people in Spain and Italy. The form of it called *Cricket* (q. v.) is still played in England by all classes, and *Golf* (q. v.) is a favourite game in Scotland.

For cultivating graceful motion, agility, and strength, as well as promoting general health of body and cheerfulness of mind, B.-playing is one of the best gymnastic exercises. Ancient physicians were in the habit of prescribing a course of balls to their patients where most modern doctors would likely prescribe *pills*; and in this point at least the ancient practice might be copied with advantage.

BALL. In the somewhat indefinite language of the military and naval arts, all kinds of shot and bullets are occasionally called by the collective name

of *ball*. This was especially the case when nearly all such projectiles were solid and spherical, before the era of hollow and spheroidal shells. At present, when the varieties are so numerous, it is more usual to employ the terms BULLET and SHOT (q. v.). These, together with SHELL, are subdivided into numerous kinds, the most important of which will be found noticed under their proper designations. A particular class of spherical combustibles is described under BALLS. For BALL-CARTRIDGE, see CARTRIDGE.

BALL (Fr. *bal*), a dancing entertainment. In England there are county balls, attended by the gentry of the shire or county, military balls, court balls, subscription balls, besides balls on various festive occasions. Whether designated balls or assemblies, these entertainments are conducted with great decorum, according to certain established usages. If of a general kind, it is customary to issue tickets only to those producing vouchers for their respectability; and to insure the most perfect propriety, a number of lady-patronesses (married ladies of distinction) take a lead in the management, and grace the assembly by their presence. Ordinarily, the charge for gentlemen's tickets at subscription balls is at least two-thirds higher than those for ladies. According to etiquette, no unmarried lady can attend a ball unless she accompany a gentleman, or a married lady. All, of both sexes, are expected to be in full dress—anything else would be held disrespectful. Fancy balls are entertainments at which every person attending is expected to be in a fancy or peculiar national costume; in other respects, they are conducted like ordinary balls. Masked balls, once so common, have now, for obvious reasons, lost their repute. At all high-class balls, there is an appointed master of the ceremonies, who superintends the proceedings, and, in the event of there being no programme, prescribes the dances.

BALLACHU'LISH, a parish on the borders of Argyle and Inverness shires, and partly in both counties. In the Argyleshire part of the parish, 11¼ miles south-south-west of Fort William, on the south side of Loch Leven, an east branch of Loch Linnhe, are the celebrated quarries of blue roofing clay-slate. These quarries have been wrought since 1760, and now employ 200 men. White and gray marble quarries exist also in the parish.

The slate is exposed on the mountain-side, and the quarries, commencing on the shore, extend southwards along the side of the mountain. The face of the rock is laid open by three workings fronting the west, and rising one above another in successive step-like terraces, all of them being entered from the north end of the bed. The height from the lowest terrace to the top of the workings is about 216 feet, and the face of rock wrought about 536 feet. The situation of the quarries permits the water and débris of broken and waste slate to be at once got rid of into the sea. The great advantage of this is evident when it is remembered that this débris amounts to more than six times the quantity of saleable material raised from the quarries. A few years ago, the annual produce amounted to from 5,000,000 to 7,000,000 of roofing-slates, weighing about 10,000 tons. Pop. (1871) 944.

BALLAD. The name is of Italian origin (*ballata*), and meant originally a dance-song, being derived from the mid. Lat. *ballare* or *balare*, corresponding to the Gr. *ballizein*, to dance. The B. is a kind of poem which it is very difficult to characterise. In the course of centuries it has undergone various transformations, and the name has been transferred to pieces which in extent, subject, and character have no longer anything in common with the primitive ballad. The confusion of ideas was rendered still worse from the circumstance that poems of exactly the same nature were styled sometimes romances, sometimes ballads, sometimes epic or lyrico-epic, or poetic narratives; so that it was left to the caprice of the poet which of these generic names he would give to his production. As early as the 12th c. the Italians gave the title of B. to short, purely lyrical pieces, allied to the sonnet or still more to the madrigal, and which generally had love-sorrows for their subject. Dante has such *ballate*. Akin to these are those French ballads which Molière set himself against, and which fell into disuse. The earliest ballads, as the word is now understood, are those of England, and of Scotland, beginning about the 14th c. They in so far resemble the Spanish Romances, that the subject in both is narrative, and handled lyrically. See LYRIC. The Spanish romance, however, has more of the lyrical element, and is of a gayer cast, reflecting the southern character of the people; while the northern B. took a more earnest, sombre shape, especially among the Danes; though in the north also there are ballads of a cheerful and sportive tone.

As far as subject is concerned, the B. is a species of minor Epic (q. v.). The name is generally applied to a versified narrative, in a simple, popular, and often rude style, of some valorous exploit, or some tragic or touching story. Ballads are adapted to be sung or accompanied by an instrument. They are comparatively short, the story being circumscribed, and not embracing a combination of events, as the plan of the grand epic does. There can be little doubt that the B. has been the first form of poetry among all nations; and that the earlier epics or heroic poems of the higher kind, such as the Spanish Cid and the German Nibelungen, grew out of such simple beginnings. Of the popular B., Scotland, or more correctly the border-land of Scotland and England, is allowed to have produced the best examples—as *Chevy Chase*, *Fair Helen of Kirkonnel Lee*, and many others. As a B. of modern composition may be instanced Goldsmith's *Edwin and Angelina*.

Many of the old popular songs of the Germanic nations are just narratives of epic events and incidents in which the feelings of the composer manifest themselves. But the name of B. was not then in use, and such poetical narratives were called simply songs, or more specifically perhaps *lays* (Ger. *lieds*). It was not till the last half of the 18th c. that the foreign name was transferred to them.

The B. has, in recent times, been cultivated chiefly by the Germans, and in their hands it has assumed a more artificial development. Bürger may be said to be the creator of the modern ballad. He was intimately acquainted with the more simple Scotch and English B. poetry; but while adhering to its spirit, he gave to his own compositions a far wider extent, surrounded his narration with descriptions of scenery and other decorations, and by means of dialogue imparted to them the vivacity of the drama. His *Leonore* has become at once classical and popular. Bürger, Schiller, Göthe, and Uhland are the greatest German names in this department of composition. Following the practice of these writers, it has become common to confine the name B. to an epic narrative with something fabulous and supernatural in the background. In this sense, Göthe's *Erlkönig* is a ballad; and Coleridge's *Ancient Mariner* is perhaps the best exemplification in English.

BALLARAT, the oldest of the considerable gold-fields of Victoria, and in fact the oldest but one of

all the gold-fields of the colony. It is about 100 miles west-by-north of Melbourne. It was first worked in September 1851, the comparatively unimportant ground at Anderson's Creek, which dated from August of the same year, having been the earliest result of the 'prospecting' which, a few months previously, had been stimulated by the newly discovered 'diggings' of New South Wales. Though B. was speedily rivalled by Mount Alexander and Bendigo, yet it has by no means lost its original pre-eminence. As its surface-digging became exhausted, mines were formed—some of them now as deep as average English coal-pits. It was estimated in 1872 that there were 215 steam-engines, of 6461 horse-power, working the alluvial mines, and 140, of 3390 horse-power, used in quartz mining. B. is unrivalled in the fineness of its gold, which averages 23½ carats, being only ½ less than the unalloyed metal.

BALLAST is a heavy substance employed to give a ship sufficient hold of the water, to insure her safe sailing with spread canvas, when her cargo and equipment are too light. The amount of B. required by a ship depends not only on her size and cargo, but also on her build; some forms of construction requiring more B. than others. It is not merely the *quantity* of B. which a skilful mariner has to consider; he is required also to take into account its *distribution*. If a heavy mass of B. be deposited within a small compass near the keel, it places the centre of gravity very low down: the ship will sail sluggishly, and is said to be 'stiff.' If, on the other hand, the B. be massed too high up, the ship becomes 'crank,' and cannot carry much sail without danger of being upset. Under average circumstances, it is considered that a ship is well ballasted when the water comes up to about the extreme breadth amid-ships.

In ballasting a ship, the cargo and B. are considered together, the quantity and distribution of the latter being made dependent on the former. In a ship of war, the B. is made subservient to the requirements of the necessary stores and war *materiel*; in a merchant or passenger vessel, to the convenience of the passengers and the careful stowage of the cargo. During the last great European war, the ships of the British navy were supplied with a certain conventional weight of B., according to size and armament. Thus, a 100-gun ship had 550 tons of B.; an 80-gun, 440 tons; a 50-gun, 235 tons; a 36-gun, 225 tons; a 20-gun, 110 tons, &c. The recent revolution in the sizes and shape of war-ships, however, and the introduction of steam-propulsion, have rendered all such fixity of ratio inapplicable.

The substances used as B. are various—chiefly iron, stone, gravel, sand, mud, and water. Iron is now superseding the next three varieties in ships of any importance; and water-ballast is gradually being introduced in the collier ships of the Tyne, Wear, and Tees. Water ballast is employed in four different ways. *Bag-water* B. is contained in water-proof bags laid on the floor of the vessel, and filled or emptied by means of a pump and hose. *Bottom-water* B. is contained beneath a false bottom in the vessel. *Hold-water* B., as employed in screw-steamer colliers constructed by Mr Scott Russell, is contained in a large receptacle, which may be filled with the cargo when the ship is not in B. *Tank-water* B. is contained in two fore-and-aft tanks, which can easily be filled and emptied. The customs' laws relieve merchant ships from certain formalities and payments when leaving a port in ballast.

The term B. is employed by civil engineers to signify the sand or gravelly material which is laid as a packing between railway-sleepers, in order to give them solidity. No English railway is considered to be complete or safe for transit until it is dressed and finished by ballasting. The possibility of procuring ballast at a cheap rate, considerably affects the cost of railway undertakings.

BALLAST HEAVING has reference to the use of sand or mud ballast. In order to prevent captains from filling up, or otherwise injuring the entrance to rivers, ports, havens, roadsteads, &c., by the discharge of ballast, certain regulations have been made at most maritime places as to its disposal. The Trinity House Corporation has a peculiar jurisdiction over the bed of the Thames, and regulates all the proceedings touching the reception and discharge of ballast. Before the use of water-ballast, the collier captains ballasted their empty ships with gravel or sand, mostly dredged up from the bed of the Thames in and near Woolwich Reach. Generally about 10,000 tons per annum were thus used. The ballast-heavers were men employed by the Trinity House Ballast-office in transferring sand from the bed of the Thames to the empty ships. When the collier vessels returned to the Tyne or its neighbourhood, they were not permitted to empty the sand in the river, but were under penalties to discharge it on shore. This is the origin of the vast mounds, or sand-hills on the banks of the Tyne, which have been made very useful in the construction of railways. Ships coming into, as well as those leaving the Thames in ballast, are equally subject to Trinity House control. The Ballast-office Corporation of Dublin has similar powers in reference to the river Liffey.

BALLATER, a village of Aberdeenshire, Scotland, on the banks of the Dee, 36 miles west-south-west of Aberdeen. It is remarkable as the resort of numerous visitors, on account of its chalybeate springs. Pop. (1871) 691.

BALLENY ISLANDS, a group of five small volcanic islands discovered in the Antarctic Ocean, 1839. Lat. 66° 44′ S., long. 163° 11′ E.

BALLET (of similar derivation with the word 'ball'—see BALLAD), a species of dance usually forming an interlude in theatrical performances, but confined principally to operas. Properly, a B. is a theatrical exhibition of the art of dancing in its highest perfection, and must therefore, in general, comply with the rules of the drama as to its composition and form. The pantomimic sacrificial dances of antiquity, although they may be regarded as the source of Attic tragedy, are not to be considered as directly the origin of the ballet. The B., as known to us, undoubtedly originated in the service of the courts. We find it existing in Italy in the beginning of the 16th c., especially at the court of Turin, where it was enriched by the inventive genius of Count Agho; and where the princes and princesses of the court themselves took part in it, in song and declamation as well as in dance; for the B. at first appeared in combination with the other theatrical arts, and completed the chaotic medley exhibited in these spectacles, which were at once mythological, allegorical, fantastic, warlike, and pastoral. From these mingled elements the individual species of dramatic entertainments were gradually evolved in their distinct forms. Baltagerini, director of music to Catherine de Medicis, was the first to introduce the B. into France, where it soon became such a favourite, that Louis XIII. danced in one of these ballets, and his example was followed by Louis XIV. in his youth. The latter made his last appearance on the stage in 1669, in the B. of *Flora*. Hitherto, the B. had always appeared in combination with the characteristic features of the opera,

and even of comedy, as is evident from the works of Quinault and Molière, arranged by Lully. The art of dancing possessed then little dramatic expression, and still required to be introduced and explained by singing and recitation. In 1697, Antoine Houbart de la Motte undertook to reform the B., to which he imparted both dramatic action and the expression of passionate feeling. About this time, women first made their appearance in the B., as well as in plays and operas, which had till then been performed exclusively by men. There is no mention of any female B.-dancer of note before 1790. About the middle of the 18th c., Noverre separated the B. from the opera, gave it an independent dramatic form, and laid the foundation in his writings of an ingenious theory on the subject. The Mythological B., a relic of the magnificence of Versailles, came to an end during the Consulate, when it gave place to the newly invented Comic Ballets *Dansomanie*, *La Fille mal Gardée*, and the *Arlequinades*. Vincenzo Galeotti, in Copenhagen, carried out the ideas of Noverre so far as to subordinate the dance to purely dramatic principles, instead of giving it the first place as formerly; and thus he gave to his ballets the character of great rhythmical pantomimes. These splendid and talented performances were longest kept up in the theatre of Milan, where the most lifelike and magnificent tableaux were exhibited in pantomime; and subjects were attempted far beyond the limits of the ballet. The story of *Hamlet* was turned into a B., and the subjects of several other tragedies were similarly treated. In general, the B. has now become unfaithful to its original design and its true artistic signification; and exhausts itself in the exhibition of mere feats of bodily agility, tasteless displays of artificial dexterity, distortions of the person almost to dislocation, and balancings of the figure in attitudes often indelicate. Consisting as it does more of external show than internal meaning, it contributes gradually to blunt the public taste for the enjoyment of the legitimate drama, which speaks more to the mind than to the eye.

BA'LL-FLOWER, so named from its resembling a ball placed in a circular flower; an ornament peculiar to the decorated style of Gothic architecture which prevailed in the 14th c. The B.-F. is supposed by some to be an imitation of a pomegranate, by others of a hawk's bell. Its form will be better understood from the illustration.

Ball-flower.

BALLINA', a seaport town on the confines of Mayo and Sligo counties, Ireland, but chiefly in Sligo, on the Moy, 7 miles south of its entrance into Killala Bay. The Moy runs through the town, is crossed by two bridges, and separates the two counties. B. proper is on the Mayo side, the Sligo portion being a suburb called Ardnaree. The tide runs up to the town, but the river is only navigable from the sea up to a mile and a half below Ballina. B. has a brisk trade in agricultural produce, salmon, and cured provisions. Coarse linens and snuff are manufactured here. Many anglers resort to the river Moy and Lough Conn. Killala Bay was the rendezvous of the French invaders in 1798. They landed, and took B., but were, three weeks afterwards, defeated at Killala. Pop. (1871) 5551.

BALLINASLOE', a small inland town on the borders of Galway and Roscommon counties, near the centre of Ireland, on both sides of the river Suck which divides the two counties—8 miles from its confluence with the Shannon, and 81 miles west of Dublin. The Suck at B. is divided into several channels, over which the road from Athlone to Galway is carried by a succession of bridges and causeways 500 yards long. B. is noted for its great annual fair in October, one of the largest in the kingdom. It is the seat of a poor-law union, and the station of the Galway militia staff. Pop. (1871) 4619.

BALLINROBE, a small town of Ireland, county Mayo, picturesquely seated on the Robe, about 7 miles from its mouth in Lough Mask, and about 16 miles S.S.E. of Castle Bar. B. is a seat of petty and general sessions, and has a union workhouse and a barrack. It has a weekly market and two annual fairs. Pop. (1871) 2057.

BA'LLIOL CO'LLEGE, Oxford, was founded between 1263 and 1268 by John de Balliol, father of John Balliol, king of Scotland. The original foundation consisted of 16 poor scholars, and the revenue for their maintenance amounted for many years to only 8d. per week for each. In 1340, the establishment was enriched by benefactions from Sir William Fenton and Sir Philip Somervyle, the latter of whom gave the college a new body of statutes. Its most important subsequent benefactors were Bell, Bishop of Worcester, in 1566; Wil. Hammond, Esq., in 1575; Peter Blundell's executors in 1615 and 1676; Lady Periam, 1620; Warner, Bishop of Rochester, 1667; John Snell, Esq., 1677; and Mrs Williams, 1830. The society in 1873 consisted of a master, 13 fellows, and 24 scholars. The number of members on the books was 328. The master and fellows enjoy the privilege of electing their own visitor. John Wycliffe was master of this college in 1361; among its scholars have been John Evelyn, and Bradley the astronomer. The Snell Exhibitions for students of Glasgow University, attract annually to this college a few distinguished Scottish students. Among these have been Sir William Hamilton and J. G. Lockhart.

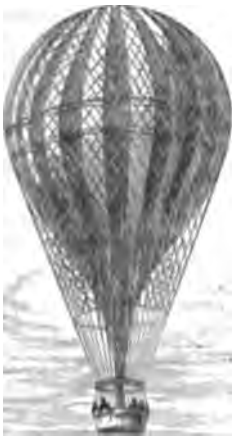
BALLI'STA. See BALISTA.

BALLI'STIC PE'NDULUM. An instrument so named was invented by Robins, in the latter part of last century, to ascertain the velocity of projectiles, and to prove the quality of gunpowder. It consists of a large block of wood, suspended from a strong horizontal axis; and it is so solidly constructed as to bear the heaviest blow of the heaviest shot without injury. An excavated centre on one side of the block is filled with sand, packed in leather upon an iron frame; four bags form a filling or core. The core, forming the place of impact, is easily replaced after each firing. Straps of wrought iron suspend the block from the wrought-iron axis or shaft. The shaft-ends have knife-edges, which rest on V supports. The construction is such, that a violent percussion makes only a very slight oscillatory movement in the block. A brass graduated limb measures the arc of vibration; and a brass slide is pushed forward by an index attached to a bar connected with the suspension straps. Another form of instrument for similar purposes will be described under ERROUVETTE; and some of the results of these experiments will be noticed under GUNNERY. See WAR-SERVICES in SUPP.

BA'LLIUM. See BAILEY.

BALLOO'N (Fr. *ballon*, a large ball). According to the principle of Archimedes (q. v.), bodies immersed in a fluid are buoyed upwards with a force equivalent to the weight of the fluid displaced by them. If their own weight is not sufficient to counterbalance

ree— that is, if they are lighter than the fluid — se upwards with a force equal to the difference weight of the displaced fluid, and of their eight. A B., therefore, which consists of an ment enclosing a gas within it, will rise in air



Balloon.

same way that a cork rises in water, provided se weight of the whole be less than that of an volume of air. If one, for instance, occupy ch space as 1000 lbs. of air, but weigh itself ng, gas, and appendages 600 lbs., it will be sed upwards with a force of 400 lbs. The employed for filling balloons are either hydro- ordinary coal-gas. The former, when pure, ween fourteen and fifteen times lighter than pheric air, and the latter generally about two half.

B., as it is at present employed, is a large haped bag, made of any pliable silk cloth, d with a varnish, made by dissolving caoutin oil of turpentine, to render it air-tight. ommon size of this bag varies from 20 to t in equatorial diameter with a proportionate . The mouth or neck of this bag is just nough to enable a man to get inside to make ecessary repairs, and is, of course, turned rards when the B. is inflated. A net-work npen or cotton twine is accurately fitted to , and the separate cords, on which it ends, ed to a circular hoop placed a few feet the neck. The car, generally a large wicker-, is suspended by ropes from this hoop, and at a considerable distance below, so that the ut may be removed from the vicinity of the The net-work serves to distribute the weight of r and its charge equally over the whole upper e of the balloon. One of the most important ities in the construction is the valve, which is ased into the top of the balloon. It consists of len clapper, four or five inches square, opening ls, and kept closed by a sufficient spring. attached to this valve descends through the nto the car, where, to prevent accidental openis allowed to dangle freely. The furniture of r are the ballast or sand-bags, by emptying the B. may be lightened; the barometer, responding apparatus for telling the height ed, or the upward or downward course of the e map and compass, for shewing the direction of the voyage; and the grappling-iron, tied to the end of a long rope, for anchoring the B. at the descent. During his flight, the aëronaut has at his disposal the means of guiding his air-ship only in an upward or downward direction, the motion of translation being wholly dependent on the wind by which it is borne. If he wishes to ascend, he throws some of the ballast over the side of the car; and if to descend, he pulls the valve-rope, so that, the gas rushing by virtue of its specific lightness through the passage made for it by the open valve, the buoyant material may be lessened. It is evident that the power of thus directing his machine becomes more limited with each exercise of it, for in each case there is an unrepaired loss of the means necessary to it. All attempts at guiding balloons in a horizontal direction have hitherto proved failures. In ordinary flights, the mouth of the B. is left open, so that there is no danger of explosion arising from the expansion of the gas in the rarer regions of the atmosphere. The diffusion that takes place through the open neck is inconsiderable during the few hours that an aërial voyage lasts. Early aëronauts, who kept their balloons closed, frequently ran considerable risk by inattention to the valve when the imprisoned gas demanded vent for its expansion.

The art of traversing the air by means of balloons, generally called Aeronautics, and sometimes Aerostation, is of comparatively recent date. The germ of the invention of balloons is to be found in the discovery by Cavendish, in 1766, of the remarkable lightness of hydrogen gas, then called inflammable air. Professor Black, of Edinburgh, seems to have been the first who conceived the idea that a light envelope, containing this gas, would rise of itself. He requested Dr Monro, the professor of anatomy, to give him some thin animal membrane for the experiment, but for some reason or other, it was never made. The first practical attempts were made by Cavallo, who, in 1772, filled soap's bladders and paper-bags with the gas, but found the former too heavy, and the latter too porous; and he only succeeded in raising soap-bubbles inflated with the gas. The invention of the B. is due to the two brothers Stephen and Joseph Montgolfier, paper-makers at Annonay, in France, whose names are as distinguished in the development of their own branch of manufacture as in the history of aeronautics. It immediately struck these brothers, on reading Cavendish's *Dr[illegible]'s Kite's of Air*, that the air could be rendered navigable by enclosing a light gas within a covering of inconsiderable weight. Led by their avocation, they fixed upon paper as the most fitting material for the purpose, and first attempted to make balloons of paper filled with inflammable air. Finding that these emptied themselves almost as soon as they were filled, instead of abandoning the paper as an unsuitable covering for the gas, they sought after another gas more suited to the paper. By a chain of false reasoning which need not here be detailed, they thought they found such in the gas which resulted from the combustion of slightly moistened straw and wool, which had, as they imagined, an upward tendency, not only from its being heated, but from its electrical properties, which caused it to be repelled from the ground. It is hardly necessary to say, that this so-called Montgolfier gas possessed no advantages for raising balloons other than that possessed by heated air of any kind; in fact, the abundant smoke with which it was mixed, by adding to its weight, rather detracted from its merits. At Avignon, in November 1782, Stephen Montgolfier first succeeded in causing a silk parallelopiped, of about 50 cubic feet, to rise to the roof of a room. Encouraged by this

success, the brothers made experiments on a larger scale at Annonay with an equally happy result; and finally, in June 1783, in the presence of the states of Vivarais, and of an immense multitude, they raised a B., 35 feet in diameter, to a height of 1500 feet. This last, nearly spherical in shape, was made of packcloth, covered with paper, and was heated by an iron chaffer placed beneath it, in which 10 pounds of moist straw and wool were burned.

The news of this extraordinary experiment soon reached Paris, where it produced a most lively impression. A commission was appointed by the Academy of Sciences to report upon it. Public curiosity, however, could not await the tardy decision of this body, and accordingly a subscription was entered into to defray the expense of repeating the Annonay experiment. Such was the excitement that the subscription was filled in a few days, and the construction of the B. was intrusted to the brothers Robert, famous philosophical instrument-makers of the day, and to Professor Charles, a young but experienced physicist. As the detailed account of the Annonay ascent had not reached Paris, and as nothing was therefore known of the Montgolfier gas, Charles fixed upon hydrogen as the gas most likely to insure success. It was, however, a formidable undertaking to produce it in sufficient abundance for a B., as it was at that time only dealt with in small quantities in the lecture-room. By ingenuity and perseverance combined, he triumphed over this difficulty, and succeeded in filling, in the course of four days, a silk globe of 12 feet in diameter. This B. was transferred to the Champs de Mars, the largest open space in Paris, where, on the 27th of August 1783, it ascended in the presence of 300,000 spectators, half the population of the city. At the instance of the commission already referred to, Stephen Montgolfier constructed a fire-B., 72 feet high, and 41 feet in diameter. It ascended before the commission on the 12th of September 1783, but being held captive, it was much injured by a violent wind, which blew at the time, and after it descended it was finally broken up by heavy rains. Another was made of nearly the same dimensions, which ascended on the 19th of the same month at Versailles, the king and royal family 'assisting' at the spectacle. This ascent is worthy of note, from the fact that a sheep, a cock, and a duck were placed in an ozier-basket attached to the lower part of the B., and that these first aerial voyagers reached the ground again in safety.

The B. was now a *fait accompli*, and it began to be seriously discussed whether it might not be serviceable as an air-ship for bearing men aloft as passengers. The solution of this question was first given by Pilâtre des Rosiers. In a Montgolfière, as the heated air-B. was called, 74 feet high, and 48 feet in diameter, supporting at its base a gallery of wicker-work, he, in company with the Marquis d'Arlandes, made the first aërial voyage, 21st November 1783. They remained in the air twenty-five minutes, and sailed across the Seine and over a considerable part of Paris. The year 1783, so fertile in the annals of aërostation, would indeed not have passed away without witnessing an additional, and even more satisfactory triumph. On the 1st of December, Professor Charles, along with Robert, rose from the Tuileries gardens with a hydrogen B. then called a *Charlière*—made from the proceeds of a public subscription. This B. was made of alternately red and yellow gores of silk sewed together, and coated with caoutchouc varnish. It was covered with a net which supported the car, and was furnished with a valve, a barometer, and sand-ballast, and was, in fact, a complete aërial machine. It may be said that the art of aërostation at once attained perfection in Charles's B., and no essential change or improvement has taken place since. In consequence of the danger attending the use of fire-balloons, and the engrossing attention which they demand of the aëronaut, they have now entirely given way to the hydrogen or coal-gas balloons. Before they became obsolete, several remarkable voyages were made in them. The same Pilâtre des Rosiers made 30 voyages in one of them, the longest voyage ever executed in a Montgolfière. Among the names of the first professional aëronauts, those of Lunardi, Blanchard, and Garnerin deserve special note. Lunardi was the first who made the ascent in Great Britain; and Blanchard, along with the American Dr Jeffries, crossed the English Channel from Dover to Calais in circumstances of almost unparalleled danger, January 7, 1785. Garnerin first descended from a B. by a Parachute (q. v.), October 22, 1797. It is much to be regretted that the first aëronaut, Pilâtre des Rosiers, fell a victim to a blind devotion to his art. In order to outvie Blanchard he constructed a compound machine, consisting of a hydrogen B. above and a Montgolfière below, and started from Boulogne, accompanied by a young natural philosopher named Romain, on the morning of the 5th of June 1785. He had not ascended many minutes, when, as it afterwards appeared, on attempting to open the valve of the hydrogen B. by the rope attached to it, he caused a rent of several yards in it, so that it emptied itself almost immediately, and fell on the Montgolfière beneath. The fire in the latter not being kindled, the whole machine fell with a frightful rapidity to the earth, and the ill-fated aëronauts perished on the spot whence they had risen. It is worthy of remark, that though several melancholy incidents of this kind are on record, the number of casualties in the navigation of the air has been less in proportion than in the navigation of the sea. For 1500 aëronauts and 10,000 ascents, calculating approximately, only 15 lives have been lost, certainly a small proportion considering dangers and inexperience.

In 1794, during the wars of the Revolution, an aërostatic institution was formed at Meudon, near Paris, for training a corps of 'aërostiers,' in order to observe the enemy by means of balloons. A balloon under the management of this corps was present at the battle of Fleurus, near Charleroi, fought against the Austrians. During the siege of Paris, 1870—1871, the B. was extensively employed. Countless letters and several persons left the beleaguered city in balloons. There was, of course, no attempt made to come back in such a conveyance: carrier pigeons were the return messengers.

Balloons have been enlisted in behalf of science. The first ascent for scientific objects was made at Hamburg, July 18, 1803, by Robertson and Lhomt. The results obtained, more particularly regarding the diminution of terrestrial magnetism, and the general feebleness of electrical and galvanic phenomena in the rarer portions of the atmosphere, were considered of such importance by the French Institute, that another ascent was determined on; MM. Biot and Gay-Lussac were appointed to take the management of the B. and of the physical experiments; and they started, accordingly, on the 24th August 1804. As this aërial expedition was not altogether successful, a second was undertaken by Gay-Lussac alone, in the same year, in which he rose to a height of 23,000 feet. The observations of the French savans did not confirm those made by Robertson, for after a series of experiments, as careful as their novel situation would admit, they found that no diminution was perceptible in the intensity of electrical phenomena in the upper air. Some

many scientific aerial voyages have been taken, among which may be mentioned that oldt in America; those made by Mr Rush, ay with Mr Green as steersman, on behalf ritish Association, during 1847–1849; and by MM. Barral and Bixio (1850) at Paris. tly, the most remarkable ascents have been by Mr Glaisher for meteorological observation. e occasion he ascended to a height of 7½ miles rometer standing at 7 inches. The B. contained ubic feet of gas, and carried 600 lbs. The metric and thermometric laws of the air may s ascertained by B. ascents. The nature of currents, at present so imperfectly understood, also be discovered by the same means. The uction of coal-gas, instead of hydrogen, by Mr the most famous of English aeronauts, is the important advance in aërostation since the t days of the art. His large coal-gas B., in bore Messrs Green, Holland, and Mason from all Gardens, London, to Weilburg, in the Duchy of Nassau, distant 500 miles, in 18 hours. the United States, aërostation has been prose- with great zeal. Mr J. Wise has more than exploded his B., when high up in the air, to what he considers to be always the case, that n nts with the net-work form in such s a parachute, which moderates the of descent, and shields the aëronaut from

During 1859, the longest flight on record de by Mr J. Wise, Mr La Mountain, and who, starting from St Louis with the inten- reaching New York, succeeded in following ourse they had mapped out for themselves they had crossed Lake Erie; when they caught in an adverse current of air, and to abandon their original design, after having led 1150 miles in less than 20 hours. In mber 1859, Mr La Mountain made a trip of iles in 4 hours. Mr Lowe, another American aut, constructed an immense B., which he, an aërial ship, the greatest circumference ich was 387 feet, with a capacity to hold 00 cubic feet of gas, and a lifting-power of ns, and furnished with many new appliances erating, depressing, and directing the machine. 73, Mr Wise undertook the construction of a n to cross the Atlantic. He proposed to lay res for 30 days.

'LLOT (in French, *ballot*) is a little ball used practice of secret voting, which is the ally called 'voting by B.,' whether it be a r a ticket that is used. Votes may be taken in various ways—e. g., the voter may depo it l in either of two boxes, so conjoined that no all be able to say into which he drops it; or ay be presented with two balls—a white and a —and so drop one of them into a box that it be unknown which he used. Tickets marked ' 'No,' or with the names of candidates, will y serve the purpose of balls in private voting. Dikasts in Greece voted secretly by means of stones, or shells, with marks. From this use arked shells (Gr. *ostraka*) in popular voting the Greek *ostracism*, or secret vote of the , by which they drove into exile those who ie obnoxious to them. Tabulæ or tickets chiefly used by the Romans. If the vote con- l a change in the law, the tickets were marked , the initial letters of the words 'Uti Rogas,' sing consent to the proposer's proposition; . for 'Antiquo,' expressing adherence to the old If the vote concerned the election of candidates public office, then the tickets bore the names candidates. The system of secret voting in was fixed by various laws, of which the Gabiniana Lex most closely resembles the modern project of vote by ballot.

The system of vote by B. is much in use among moderns in private or social clubs, and in the election of officers and other acts of public or joint-stock companies. The propriety of employing it in private clubs has never been questioned, for to the harmony of these it is essential that the votes of a few should suffice to exclude an obnoxious person; and looking to the personal and invidious nature of the vote, it is equally essential to their harmony that the voting should be secret. A candidate for admission, who succeeds in the face of a few, though not a sufficient number of voters, could not but regard those who voted against him as enemies. But if the voting be by B., all he can know, if the voters keep their own counsel, is that some persons are unfriendly. It is thus left open for him to associate on friendly terms with all the members—a condition of the success and continuance of such associations. But whether the system was suited to political and municipal voting, used to be in this country the subject of keen debate, at a time when it was in use in France, in several of the United States, and in the Australian colonies.

We have said that the system prevailed in Greece, and on its fruit there—especially in the exercise of the ostracism—there have been various opinions. While some have considered that the Athenians, for instance, acted under cover of secrecy, frequently without a just sense of responsibility, there is the authority of Mr Grote, in his *History of Greece*, on the other side, to the effect, that they exercised the right most beneficially. But if we have in Mr Grote an advocate of the B., in Gibbon we have an opponent of it. In his *Decline and Fall of the Roman Empire*, that philosopher dates the decline of the republic from the introduction of secret voting, which, he says, destroyed public confidence—in effect, broke up the ancient relations of patron and client, and caused a general demoralisation of the people. To come to modern times, we find the B. in use in the Venetian senate; and that in Britain it was first demanded, not for the purpose of elections, but of votes in parliament. In Scotland, during the revulsions against the court in the reign of Charles II., the system was actually adopted in the legislature; but it does not appear to have afforded voters in all cases the desired protection. No one would now dream of demanding its introduction in parliament, whose proceedings, according to popular opinion, cannot be too open and above board. On this point it may be mentioned that secret voting was the rule, for over five years (from 1840–1845), in the Chamber of Deputies in France, when it was abolished, as being productive of abuse. This, however, as we have said, bears on a use of the system that has now no advocates. Two illustrations remain of its use in elections. In the colonies of Melbourne and Sydney, the B. is said to have worked well, though it has been doubted whether its efficacy has been properly tested in these countries, in which there is so much individual independence, peculiar to new countries, that those who vote care little for concealment. In the United States, on the other hand, it is said to be the general opinion that the system has proved inefficacious. In the state of New York, where the B. was adopted several years ago, there is now a party demanding open voting, as a cure for the evils introduced by the secret system. They say it has among the Americans opposed no effectual obstacle to coercion and intimidation from the majority, while those to whom the arrangements for secrecy are entrusted, flagrantly betray their trust, and the voters on either side are, as a rule, well known to the public.

The advocates of the B. used to maintain that it would prevent bribery, intimidation, and undue influence. They regarded its reputed failure in America as being beside the question as to its suitability for this country, because in America what the voter has to contend against is the pressure of the many, while with us he seeks to resist coercion by individuals. The tenants, for instance, they said, want security, through concealment, against the loss of their farms, should they vote against the wishes of their landlord. They believed it would prevent bribery, through the uncertainty that the bribed party would vote as he promised. And as a candidate would not give bribes, because he could not trust that he would get value for his money, so intimidation would not be attempted in the absence of any security that it would be of effect. To this it was answered, on the other side, that the case of America was in point, inasmuch as intimidation might arise here, as there, from a majority, and that the case of a shopkeeper and his patrons was that of many against one all over the world. If the B. failed to protect the unit against the crowd in one country, how could it succeed in another? As to the undue influence of individuals over many—as of a landlord over his tenants—it could only be prevented providing the many, in all their public acts, contradict their secret votes. If the many acted publicly as if they agreed with the few, and privately voted against them, we should have had a state of things in which the professed public opinion would have been in antagonism with the public policy, supported by private votes—a state of things justly regarded as being impossible to be produced. The influence of individuals, then, must remain—i. e., the secret voting would be of no use, since, short of lifelong hypocrisy, it must fail to be a protection. As to bribery, the opponents of the B. thought better of human nature than those who would purify it by machinery. 'Honour among thieves,' they said: 'he who takes a bribe, either has no principle left in him for which to vote contrary to his promise, or will be guided by his deceased sense of honour.' On the other view, they put it, you secure the vote of a rogue, through his playing the knave doubly, by the public in taking a bribe, and by the briber in not fulfilling his pledge. That men will be inclined to give and take bribes as formerly, despite the somewhat diminished security, they appeared not to doubt.

An element in the controversy was the question—whether the franchise was to be regarded as a public trust, or a private power to be used at the individual's discretion. The opponents of the B. maintained the franchise to be a trust, on which view, certainly, it should be openly exercised. Its advocates, on the other view, held the object of the franchise to be the ascertainment of the conscientious opinions of the people. The fact is, the right partakes of both characters: it is a power of expressing opinion by the agent under a sense of responsibility. The B. gives greater security for independence of thought; but the public vote is attended by the greater security for sense of responsibility. It used to be common to sprinkle pleas against the B. with high praise of the whole scheme of British politics, as open, manly, and candid, and with expressions of contempt for the B., as sneaking, and dissonant with that scheme. But the advocates of the B. were not unprepared with a ready and obvious retort to such arguments. Public feeling was kept alive on this question by annual motions in parliament. From 1835, its introduction was an open question with the Whigs. The Radicals, in 1859, were greatly pleased to find Lord John Russell expressing himself as being also a convert to their views. The controversy was an end to in July 1872, when voting at parliamentary and municipal elections in Great Britain Ireland was decreed to be by ballot.

BALLO'TA. See HOREHOUND.

BALLS, HOLLOW. In military pyrotech many varieties of B. are made, differing in purp from bomb-shells, but, like them, filled with ible composition. They are used to give light, produce a dense smoke, or to diffuse a suffocat odour. Some of them, though called B., are globular in shape. *Light B.* consist of canv stretched over a skeleton-frame, and painted; t frame is filled with a composition of saltpetre, s phur, resin, and linseed-oil, rammed down ha and is provided with a fuse, the length of wh determines the time that will elapse before the co position ignites. These light B. weigh from 5 lbs. 70 lbs. each, according to their size. They intended to give out a brilliant light, which m reveal the operations of the enemy during a at a siege or in the field. *Smoke-B.* are of several thicknesses of paper, shaped by m of a globular core or mould. They are filled gunpowder, saltpetre, powdered sea-coal, Swe pitch, and tallow; and are calculated, after bei fired off, to send out a dense smoke for m half an hour, in order to blind or incommode enemy. *Stink-B.* are filled with a composi which, when ignited, diffuses an odour alm intolerable. Some of the contrivances of Capt Norton and other inventors at the present da noticed under ASPHYXIANTS, are extensions of t same principle as these inflammable balls. It m here be added, that most of these projectiles, es cially light B. and smoke-B., are fired from mortars rather than from guns.

BA'LLY, BAL, a Celtic word or prefix, signifying 'town' or 'dwelling,' enters into the composition hundreds of names of places in Ireland and Scotla It is allied (see letter B) to Gr. *polis*, city, and the Lat., Ital., and Span. *villa*.

BALLYCA'STLE, a small seaport town in north of Antrim county, Ireland, in an inlet opposite Rathlin Isle, 88 miles north of Belfast, a 5 miles south-west of Fairhead. It lies at the b of Knocklayd Mountain, 1635 feet high; and marine and mountain scenery around is very roma tic. B. consists of an upper and lower town, quarter of a mile apart. Its harbour w £150,000, but the former is now fill... Coal was dug here at least 500 y manufacture and salmon-fishery are c here. Near B. are the Bonnamargy Ab There is a singular fissure, called the 'Gray Path,' in the face of a greenstone precipice on the way to Fairhead. Pop. (1871) 1626.

BALLYME'NA, a small inland town in centre of Antrim county, Ireland, in a plain on right bank of the Braid, 2 miles above with the Maine, and 33 miles nor Belfast. It lies in a densely peoplea... vated district, the inhabitants uniting of agriculture with the manufacture of one of the greatest linen and flax ma Ireland, and its vicinity is covered with bleach-fields. Pop. (1871) 7628.

BALLYSHA'NNON, a small s... the south of Donegal county, Ir... town of the county, though not ... is situated at the mouth of the ...

small inlet running off from Donegal Bay, and 120 miles north-west of Dublin. A bridge of 14 arches crosses the Erne here. The Erne discharges more water than any other Irish river except the Shannon, and falls 140 feet over a rugged bed in the last 9 miles of its course; 400 yards below the bridge at B. the river falls in a cataract 16 feet high at low water, and 450 feet wide, over a limestone ledge of rock. The chief streets of B. are very steep. There is a valuable salmon-fishery on the river. The export trade is small, in consequence of the existence of a bar at the mouth of the harbour and the prevalence of west winds. Pop. (1871) 2009.

BALM (*Melissa officinalis*), an erect, branching, perennial, herbaceous plant, of the natural order *Labiatæ*, a native of the south of Europe, naturalised in a few places in England. It has ovate crenate

Balm (*Melissa officinalis*).

leaves, and axillary half whorls of white flowers on one side of the stem. The whole plant has an agreeable lemon-like smell, on account of which it is frequently cultivated in gardens. The stems and leaves are used in medicine as a gentle aromatic, stimulant, and tonic. B. is also employed for making an agreeable and somewhat exhilarating beverage called B. Wine. B. was formerly in much higher repute than now for its medicinal virtues. Its qualities depend on an essential oil of a pale yellow colour, called Oil of Balm.

For medical use, the herb should be cut before the appearance of the flowers, which begin to expand in July. It is nearly inodorous when dried. The taste is somewhat austere, and slightly aromatic. B. scarcely produces any remedial operation upon the system. The quantity of oil which it contains is not more than sufficient to communicate a pleasant flavour to the infusion, which forms an excellent drink in febrile complaints, and when taken warm, tends to promote the operation of diaphoretic medicines. A variety of the common Cat-mint (*Nepeta cataria*, with a smell like that of B., is often mistaken for it. Moldavian B. (*Dracocephalum Moldavicum*) is a native of the country from which it derives its name, and of Siberia, &c.; an annual plant, having, when fresh, a smell like that of B., but less pleasant. It is much used in Germany for flavouring dishes.—Bastard B. (*Melittis Melissophyllum*), a native of the south of England and of many parts of Europe, is a very beautiful plant, which when dried has a delightful fragrance, and retains it long. All these are of the natural order *Labiatæ*.

BALM OF GILEAD. See Balsam of Gilead.

BALMORAL CASTLE, the autumnal residence of Her Majesty Queen Victoria, is situated in a beautiful dell in Braemar (the south-west district of Aberdeenshire), on a natural platform that slopes gently down from the base of Craigan-gowan to the margin of the river Dee in front; and about 48 miles west of the city of Aberdeen. The castle commands a magnificent prospect on all sides. In 1848, Prince Albert purchased the reversion of a 38 years' lease from the representatives of Sir Robert Gordon, who had held it under the Earl of Fife; and in 1852 he acquired the fee simple of the estate from the Fife trustees for a sum of £32,000. The old castle not being sufficiently commodious for the royal family, Prince Albert erected a new one at his own expense, in what is called the Scottish baronial style of architecture. The castle consists of two separate blocks of building, united by wings and a massive tower 35 feet square, rising to the height of 80 feet, surmounted by a turret 20 feet high. At a distance, the castle, which is built of granite, has a striking and imposing appearance, looking almost as if it had been hewn out of one huge rock of that material. Great improvements have been made, chiefly those projected by the late Prince Albert in the approaches to the royal residence. The estate now includes Birkhall, Knock Castle-muns, Loch Muick, and 'dark Lochnagar,' celebrated by Byron; which is about seven miles south-west of B. C., and contains about 10,000 acres in addition to 30,000 acres of hill ground, which have been converted into a deer forest.

BALNAVES, Henry, of Halhill, an eminent lay-reformer of the 16th c. Born at Kirkcaldy in Fife-shire of poor parents, who, however, contrived to give him a university education at St Andrews, he went to the continent, and entered a free school at Cologne, where he greatly improved his scholarship, and received instruction in the principles of the new faith which Luther had just promulgated. On his return to Scotland, he studied law, and acted for some time as a procurator at St Andrews. In 1538, James V. made him a senator of the College of Justice; and on Arran being appointed to the regency, B. was made secretary of state. In 1543, he was imprisoned on account of his Protestantism, but appears to have been liberated in the following year. He now appears to have made himself active on the Protestant side; and it is asserted that he was privy to the conspiracy formed for the murder of Cardinal Beaton, and that he acted for the conspirators at the English court. In 1547, he took refuge in the Castle of St Andrews, and was declared a traitor and excommunicated. When the castle was captured by the French, B., with Knox and others, were sent to Rouen as prisoners of war. While in prison here, B. wrote a treatise on Justification, to which Knox added marginal notes, and prefixed a dedication, and which was afterwards published with the title of *The Confession of Faith*. When Mary of Guise was raised to the regency in 1554, B.'s forfeiture was rescinded, and he returned to Scotland, and took an active part on the side of the Lords of the Congregation, by whom he was appointed one of the commissioners

who settled the treaty of Berwick in 1559—1560, which established by law the reformed religion in Scotland. In 1563, B. was nominated a commissioner to revise *The Book of Discipline*. He afterwards acted for the Regent Murray in the inquiry into the charges against Mary for the murder of Darnley. He died in 1579; one account says 1570. Both Knox and Melville had a high opinion of him alike for his piety, wisdom, and learning.

BALSAM, a name formerly comprehensive of many resinous substances and oils, to which important medicinal virtues were ascribed, as well as of medicines compounded of resins and oils. When the term B. is now used without addition, the balsams of Peru and Tolu are generally intended.—These two balsams are very similar in all their more important properties, and are both produced by trees of the genus *Myrospermum* (or *Myroxylon*), of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, natives of the tropical parts of America. *M. peruiferum*, which is called the Quinquino, a beautiful tree, common from Peru to Mexico, is generally regarded as the species which produces the B. of Peru; and *M. toluiferum*, a very similar species, found on the mountains of Tolu, the banks of the Magdalena, &c., as that which produces the B. of Tolu; but it is doubtful if the difference is not at least as much owing to the modes of procuring and preserving the B.; and other species of the same genus (*M. punctatum* and *M. pubescens*) are supposed also to yield it. B. of Peru appears in two forms, known as *White B. of Peru* and *Black B. of Peru;* the former of which has been said to be obtained from the pods, and the latter from incisions in the trunk of the tree; but it has also been stated that the white B. flows from the trunk, and that the black B. is obtained by distilling down the wood after the manner of tar-burning, or by boiling with water. The actual evidence is insufficient to determine these points with certainty, and it is not improbable that different methods may be employed. White B. of Peru is at first of the consistence of recent honey, and of a light yellow colour; the black B. is of a reddish or blackish brown colour, and of the consistence of treacle. B. of Tolu, until recently, appeared in commerce dry and friable, but is now generally soft and tenacious when first imported, becoming hard by age. Both balsams have a very fragrant odour. They are used in confectionary, to impart a flavour like that of vanille; also in perfumery, and for pastilles, &c. In medicine, they are administered as gentle stimulants and tonics, and particularly in chronic bronchial affections. *Tolu lozenges* are a popular and pleasant remedy for troublesome coughs. These balsams are also used for cleansing ulcers.—They contain Cinnamic Acid, and a peculiar oily substance which has been called *Cinnameine*, and is also known as Oil of B. of Peru. The name *White B. of Peru* is sometimes given to a balsamic substance which flows from the *Liquidambar styraciflua*. See LIQUIDAMBAR.

BALSAM, or BALM OF GILEAD, is a liquid resinous substance, which has long enjoyed a very high reputation in the East, being prized not only for its fragrance, but also for the medicinal virtues which it is supposed to possess. It is the subject of several allusions in the Old Testament, which strongly indicate the prevalent opinion of its preciousness; and is celebrated by Strabo, Pliny, Diodorus Siculus, and other ancient writers, almost as a cure for every disease. It is still somewhat doubtful what tree furnishes it, but it is generally believed to be a species of *Balsamodendron* (q. v.)—a small tree growing in Arabia and Abyssinia, and known as *B. Gileadense*. The finest balsam, called Opobalsam or Balm of Mecca, is obtained by incisions, is at first turbid and white, but finally becomes of a golden yellow colour, and of a consistence like honey. Inferior kinds are obtained by boiling the fruit and the wood. B. of Gilead is irritating when applied to the skin, and is believed to resemble B. of Copaiva in its effects upon the human system. *Balsamodendron Opobalsamum*, a species very nearly allied to *B. Gileadense*, is sometimes said to yield this balsam.

Other substances, sometimes designated balsams, and possessing a somewhat similar fragrance, are produced by different species of *Amyridaceæ* (q. v.). Among them is one called American Balm of Gilead, the produce of a tree called *Icica Caranna*.—Balsamic substances are furnished also by a number of species of *Clusiaceæ*—Balsam of Umiri, a fragrant yellow fluid, by *Humirium floribundum*, a South American tree, of the natural order *Humiriaceæ*.—CANADIAN BALSAM is a kind of turpentine obtained from the Balm of Gilead Fir (*Abies balsamea*); HUNGARIAN BALSAM, from the Mugho or Mountain Pine (*Pinus Pumilio* or *Mughus*); and CARPATHIAN BALSAM, from the Stone Pine (*Pinus pinea*). See FIR and PINE.—BALSAM OF COPAIVA is the produce of different species of *Copaifera*. See COPAIVA.

BALSAM is also the common name of a natural order of succulent herbaceous plants, *Balsamineæ* or *Balsaminaceæ* of botanists, of which the beautiful B. (*Impatiens balsamina* or *Balsamina hortensis*,

Balsam (*Impatiens Noli-me-tangere*).
a, top of stem with leaves and flowers; *b*, ripe fruit unopened; *c*, ripe fruit, elastically opening.

so much cultivated in gardens and gr[illegible] is a familiar example. Upwards of o[illegible] species are known, natives chiefly of d[illegible] places in the East Indies, and many[illegible] plants of great beauty. They are almost[illegible] and have generally white or red flow[illegible] natural order is very closely allied to (see GERANIUM) and *Oxalideæ* (q. v.), [illegible] &c., but is distinguished from both by [illegible] irregularity of the flowers, and [illegible] also, by the beakless fruit, [illegible] capsule, bursting by five elasti[illegible] are simple and without [illegible] rally axillary.—The co[illegible]

East Indies and Japan. Many fine varieties have resulted from careful cultivation. It has an upright succulent stem, usually about 1—2 feet high, but in favourable circumstances will attain a greater size. It often appears with flowers partially double, but still capable of producing seed. In Britain, the seed is usually sown on a slight hotbed, and the plant is often kept in the green-house; although even in Scotland it may be made an ornament of a sheltered border. It is one of the flowers frequently to be seen in cottage-windows. A vulnerary was formerly prepared from it, whence it has its name. One species of B. (*Impatiens Noli-me-tangere*), called Yellow B. or Touch-me-not, is a native of Europe, and a doubtful native of Britain. It has yellow flowers, and one of the petals prolonged into a spur. Its ripe capsules burst on the slightest touch. This and two other species are natives of North America.

BA'LSAM OF SU'LPHUR is a mixture employed for medicinal purposes, and considered of service when applied to foul ulcers. It is prepared by dissolving 1 part of flowers of sulphur in 8 parts of olive oil, which yield a dark, reddish brown, thickish substance, with a very unpleasant odour.

BALSAMODE'NDRON (Gr. balsam-tree), a genus of small trees or bushes of the natural order *Amyridaceæ* (q. v.), having small green axillary flowers, small dry oval fruits, and small pinnated leaves with 3 or 5 leaflets. Some of them are spiny; they generally exhibit a scrubby appearance, and have little foliage. They are remarkable for the balsamic substances obtained from their wood and fruit—as Balsam of Gilead (q. v.), Myrrh (q. v.), Bdellium (q. v.), and Oriental Elemi (q. v.). The red resinous wood of *B. Kataf* is a common article of sale in Egypt; and a species called Schnee is much cultivated in Afghanistan for its aromatic and stimulant properties. All the known species are natives of the East Indies, Arabia, and the east of Africa, except that which yields African bdellium, which is found in Senegal.

BA'LTA, a well-built and thriving town on the Kodema, an affluent of the Bug, in the government of Podolia, Russian Poland. Pop. 1867) 14,528.

BA'LTIC PRO'VINCES (in Russia). This term, in a wider sense, comprehends the five Russian governments bordering on the Baltic—viz., Courland, Livonia, Esthonia, Petersburg, and Finland; in a restricted sense, it often designates the first three. The B. P. once belonged to Sweden, except Courland, which was a dependency of Poland. They came into the possession of Russia partly in the beginning of the 18th c., through the conquests of Peter the Great, partly under Alexander in 1809. They have still very various constitutions, though the usual 'government' machinery has been introduced, and every effort is made completely to Russianise them. The five governments have an area of about 200,000 square miles, with a population in 1867, of 4,902,543, including St Petersburg.

BA'LTIC SEA, is the great gulf or shut sea bordered by Denmark, Germany, Russia, and Sweden, and communicating with the Kattegat and North Sea, by the Sound and the Great and Little Belts. Its length is from 850 to 900 miles; breadth, from 100 to 200; and area, including the Gulfs of Bothnia and Finland, about 160,000 square miles. Its depth is on an average 15—20 fathoms, in many places not half so much, seldom more than 40—50, and never exceeding 167. Its shallowness and narrowness, the flat coasts of Prussia on the one side and the rocky coasts of Sweden on the other, and above all the numerous and sudden changes of wind accompanied by violent storms, make the navigation of the Baltic very dangerous. The group of the Aland Islands divide the south part of the sea from the north part or Gulf of Bothnia (q. v.). The Gulf of Finland (q. v.), branching off eastwards into Russia, separates Finland from Esthonia. A third gulf is that of Riga or Livonia. The Kurish and other Haffs (q. v.) are not gulfs, but fresh-water lakes at the mouths of rivers.

The water of the Baltic is colder and clearer than that of the ocean. It contains only a fifth of the salt of the Atlantic, and ice hinders its navigation from three to five months yearly. Tides, as in all inland seas, are little perceptible—at Copenhagen, about a foot; yet the water rises and falls at times, though from other causes, chiefly from the varying quantity of water in the rivers at different seasons. Upwards of 250 rivers flow into this sea. The chief from Germany are the Trave, Warnow, Oder, Rega, Persante, Vistula, Pregel, and Niemen; from Russia, the Windau, Düna, Narva, Neva, and Ulea; and from Sweden, Tornea, Lulea, Pitea, Umea, Angerman, Dal, the water of Lake Maeler, and that of Wetter and other lakes through the river Motala. The basin of the Baltic occupies at least 888,710 square miles, or about one-fourth of all Europe; and only about a fourth of the boundary of the basin is mountainous. The principal islands are Zealand, Fünen, Bornholm, Samsöe, Möen, Langeland, and Laaland, belonging to Denmark; the Swedish islands Gottland, Oland, and Hveen (in the Sound); the Aland Islands, Dagö, and Oesel, belonging to Russia; and Rügen, to Prussia. The number of vessels that pass the Sound to or from the Baltic annually is very large. See SOUND DUES. Timber, hides, tallow, and grain, are the chief exports from the countries bordering on the Baltic. The Eider or Schleswig-Holstein Canal, connecting the Baltic near Kiel with the North Sea at Tonningen, facilitates the grain trade in mild winters. The two seas are also connected by the Gotha Canal, which joins the lakes of South Sweden. The most important harbours in the Baltic are: in Denmark, Copenhagen and Flensburg; in Germany, Schleswig, Kiel, Travemunde (Lubeck), Wismar, Rostock, Stralsund, Stettin, Swinemünde, Danzig, Elbing, Konigsberg, Pillau, and Memel; in Russia, Riga, Revel, Narwa, Kronstadt, and Sveaborg; and in Sweden, Stockholm, Karlskrona, and Ystad.—The shores of the Baltic in Prussia and Courland have been long noted for the amber cast ashore by the waves in stormy weather. Another important phenomenon connected with the Baltic, is an alleged slow vertical movement of its coasts, *downwards* in the south of Sweden, but further north *upwards*, being there supposed to be at the rate of three feet in a century. See Lyell's *Principles of Geology*.—The Germanic nations call this sea *Ostsee*, or Eastern Sea; the name Baltic is derived by Dr Latham, from an island Baltia, mentioned by Pliny, and which Dr Latham considers to be Zealand.

BALTIMORE, a city, port of entry, and seat of justice of Baltimore county, Maryland, U. S., in lat. 39° 17' N., and long. 76° 36' W. It stands round a small bay which runs back from the left side of the Patapsco, about 12 miles from its entrance into Chesapeake Bay, and about 200 miles, by a ship's course, from the open Atlantic. The city was founded so late as 1729. The surest test of its prosperity is to be found in the successive results of its census since 1800. In 1800, there were 26,514 inhabitants; in 1810, 46,455; in 1820, 62,738; in 1830, 80,620; in 1840, 102,513; in 1850, 169,054; in 1853, about 195,000; and in 1870 there were 267,354. Besides its safe and convenient communication with the sea, B. is connected by railway with

Philadelphia, Washington, Winchester, Annapolis, Cumberland, York, Lancaster, and Harrisburg. From east to west, the city is about 4½ miles long; and from north to south, about 3½ broad, and covers about 10,000 acres. It is divided into two nearly equal parts by 'Jones's Falls,' a rapid stream which, though troublesome from its floods, and expensive from its bridges, at once affords immense water-power, and supplies an abundance of pure water for domestic use.

In 1871, imports were 26,770,181 dollars; and exports, 18,236,166 dollars. Entered the port, 362 British ships, of 131,316 tons; 519, other nations: cleared, 351 British ships, of 132,016 tons; 513, other nations. There are 25 newspapers.

Among the commemorative structures which have gained for B. the name of the 'Monumental City,' the most interesting is an elegant obelisk, which was erected in 1815 to the memory of those who had fallen the year before in defending the town against an attack of the British. As was to be expected in the wealthiest city of Roman Catholic Maryland, the Roman Catholic cathedral takes the lead among the ecclesiastical edifices of B. It is a massive building of granite, being 190 feet long, 177 broad, and to the top of the cross, 127 high; and besides one of the largest organs in the United States, it contains two beautiful paintings, presented respectively by Louis XVI. and Charles X. of France. In B., however, the Roman Catholics are now vastly outnumbered by other denominations, having only 20 churches out of 161.

BA'LTIMORE-BIRD, or BALTIMORE ORIOLE (*Icterus Baltimorii*), a very beautiful American bird, found in all parts of the United

Baltimore-Bird.

States, and as far north as 55° N. lat., but migrating to tropical or subtropical regions in winter. The genus to which it belongs is usually referred to the natural family of *Sturnidæ* (see STARLING). The B.-B. is in size somewhat less than a common starling; the bill conical, very acute, and a little curved; the plumage brilliant, particularly in the adult males, glossy black finely contrasting with bright orange and vermilion; the tail longish, rounded, and slightly forked. The bird is remarkably active and lively; its song extremely agreeable. Its nest is a curious and interesting structure—a pendulous cylindrical pouch of six or seven inches long, usually suspended from two twigs at the extremity of a lofty drooping branch; the mat, which vary according to circumstances, being together with great nicety. It is sometimes through and through with long horse-hairs which may happen to be bleaching, as very ha be appropriated to the purpose of nest-building.

The nests of other species of *Icterus* are pensile. Several are natives of North Americ others of South America. They are quite di from the true Orioles (q. v.).

BALTSCHI'K, or BALDJI'K, a town of Eur Turkey, 18 miles north-east of Varna, notew in consequence of being in the vicinity of the of Tomi, to which place Ovid was exiled.

BA'LUSTER, popularly, *banister* or *bal* (Ital. balaustro; Fr. balustre), the name giv the small shafts or pillars set in a line at

roofs of large edifices, &c., or as a mere termin to the structure. It is also used to enclose a altars, balconies, &c. Balustrades are made of s metal, or wood.

BALZAC, JEAN LOUIS GUEZ DE, born Angoulême in 1594. In his youth he was a tary to Cardinal la Valette at Rome, where cultivated his taste for elegant composition on his return to Paris devoted himself to ment of his native language. His effo direction have given him a permanent literature of his country; and though his not possess much intrinsic worth, they splendid phalanx of genius which a subsequent age of Louis XIV. He was of Cardinal Richelieu, a member of th Academy, a councillor of state, and his His violent literary disputes with F caused him to leave Paris and retire diary property of Balzac, where he d

18th February 1653. A collection of the works of B. appeared in Paris, edited by L'Abbé Cassaigne (2 vols. Par. 1665; 3 vols. Amst. 1684). Of all his works, his *Lettres* (3 vols. Par. 1806) have been most generally admired, and are still read. A selection from his writings was arranged by Malitourne (2 vols. Par. 1822). Compare Moreau de Mersan, *Pensées de B.* (Par. 1807).

BALZAC, Honoré de, one of the best of the modern French novelists, was born on the 20th May 1799, at Tours, where his father held a civil office. At the age of twelve, he entered the college of Vendôme, but finished his studies at the Pension Lepitre, in Paris. His father, who had been impoverished by the loss of his situation, then placed him with a notary, to whom he acted as clerk. This occupation proving intolerably irksome, B. soon after began his literary career, and wrote about 30 volumes, under the names, St Aubin, M. de Veillergré, St Alme, &c. He received some trifling assistance in writing these novels, which were, however, so unsuccessful, that he lived in the greatest poverty. In the year 1826, he entered into partnership with the printer Barbier, and published various works; but the speculation turned out so ill, that he fell into debt, and returned once more to book-making. His perseverance was admirable. Although long utterly unsuccessful, he continued to write on until at last he opened a path for himself by his novel *Les Dernières Chouans, ou la Bretagne en* 1800 (Par. 1829). In this book he abandoned for the first time the manner of Pigault and Lebrun, which he had hitherto adopted. Among his best works are the *Physiologie du Mariage* (2 vols. Par. 1831), *Scènes de la Vie Privée* (5 vols. 1831), *Scènes de la Vie de Province* (1832), *Scènes de la Vie Parisienne* (1832), *Le Médecin de Campagne*, *Le Père Goriot*, *La Peau de Chagrin*, *La Recherche de l'Absolu*, which were all received with much favour by the public. Of all his novels, two only can lay claim to anything like artistic completeness. They are the *Histoire Intellectuelle de Louis Lambert*, and *Eugène Grandet*. His other works suffer more or less from unnaturalness, diffuseness, and the want of a solid knowledge of the world, although there is a richness of description in portraying individual features of character, as drawn directly from the heart, not to be denied. B. exercises immense power over the female part of his readers. In his *Contes Drolatiques, colligez ès Abbaies de Touraine, et mis en lumière par le Sieur de Balzac pour l'ebattement de Pantagruelistes et non autres* (2 vols. Par. 1833), he follows exactly in the footsteps of Rabelais. Success made B. conceitedly ambitious. He thought himself equal to the most distinguished authors of all time, and represented the aim of his literary activity to be, to give a complete picture of human life in all its varied phases. As a dramatic author he decidedly failed. In the year 1850, he was seized with hypertrophy of the heart, of which he died on the 18th of August. Almost the whole literary world of Paris were present at his funeral.

BAMBARRA, one of the states of Sudan, Western Africa, lying, so far as has been ascertained, between lat. 12° and 14° N., long. 15° E. and 5° W., and occupying both sides of the Joliba or Niger, which flows through its centre from south-west to north-east. The principal towns of B. stand on the banks of this river. The mountains in which the Niger has its source divide it on the S. from Guinea; the Sahara desert bounds it on the N.; on the W., Senegambia; and on the E., some of its sister-states. In its general aspect, the country is said to bear a considerable resemblance to the agricultural districts of England; but in the west there are low chains of granite hills, forming continuations of the highlands from which the Niger springs. The climate in some parts is intensely hot; in others, it is more temperate, but it is generally healthy. The rainy season lasts from June to November. The land is well watered and fertile. Double crops of corn, rice, maize, yams, &c., are raised annually without much labour.

The butter-tree, cotton-tree, oil-palm, baobab, and date, are among the most important indigenous growths. The manufacturing industry of B. is important; the women making a soft coarse cloth, much esteemed for its beautiful blue colour, and the men articles in gold, iron, and ivory, in which a pretty extensive trade is carried on. The inhabitants, chiefly Mandingoes, are said to be superior to their neighbours in intelligence, and to be much sought after as warriors by the petty chiefs around them, who are at constant war with each other. They generally lend their assistance on condition of a certain payment. The upper classes profess Mohammedanism, but the lower are pagans. The introduction of the former religion has had at least one good effect. It has supplied the native dialect with a written speech through the use of Arabic letters. The chief domestic animals are horned cattle, goats, sheep, and fine horses. The wild animals are lions, leopards, elephants, wolves, panthers, &c.; and venomous reptiles, of which the natives are much afraid. Crocodiles are numerous in the rivers, which also abound with fish. The principal towns are Sego, Sansanding, Yamina, and Bammaku, which are all populous. The country has a nominal monarch, but it is in reality ruled by several chiefs.

BAMBERG, a city of Bavaria, in the district of Upper Franconia, beautifully situated on the banks of the Regnitz, not far from its confluence with the Main, and in the midst of vineyards, orchards, and hop-gardens. B., which has considerably declined in importance since the Reformation, is a city of considerable antiquity, having originated, it is said, with a colony of Saxons who settled here in 804. The most noteworthy of its public buildings is the cathedral, a magnificent edifice in the Byzantine style, founded by the Emperor Henry II. in 1004, and restored after fire in 1110. It contains, among other monuments, the elaborately carved tomb of the founder and his empress, Cunigunda. Attached to the cathedral is a library, with valuable missals and manuscripts, and what is represented to be the prayer-book of Henry II. There are several other fine ecclesiastical structures of early date, and the old palace of the former prince-bishops of Bamberg. The ruins of the castle of Altenburg, originally the seat of the Counts of Babenberg, and the scene of many important historical events, stand on an eminence about a mile and a half from the town. The educational institutions of B. are numerous. Pop. (1871) 25,718, chiefly engaged in the manufacture of beer, which is famous throughout Germany, porcelain, jewellery, gloves, musical instruments, &c. A large export trade in liquorice and garden-seeds is carried on.

BAMBINO, a term in art descriptive of the swaddled figure of the infant Saviour, which, surrounded by a halo, and watched over by angels, occasionally forms the subject of altar pieces in Roman Catholic churches. The *Santissimo* B., in the church of the Ara Coeli at Rome, is held in great veneration for its supposed miraculous power of curing the sick. It is carved in wood, painted, and richly decorated with jewels and precious stones. The carving is attributed to a Franciscan pilgrim, out of a tree that grew on Mount Olivet, and the

painting to St Luke. The festival of the B., which occurs at the Epiphany, is attended by great numbers of country people, and the B. is said to draw more in the shape of fees than the most successful medical practitioner in Rome.

BAMBO'CCIADES, in painting, are grotesque scenes from common or low life—such as country-fairs, penny-weddings, boors merry-making. The name is derived from Peter van Laar, a painter, who, on account of his personal deformity, was surnamed Bamboccio (Cripple); but he was not the first painter of such scenes.

BAMBOO' (*Bambusa*), a genus of grasses, of which most of the species attain a great size, many of them 20 or 30 feet, some 70 or 100 feet in height. The species are numerous, and are found in tropical and subtropical regions, both of the eastern and western hemispheres. They are of great importance to the inhabitants of the countries in which they grow. All of them have a jointed subterranean root-stock (rhizome), which throws up 10—100 stems. These are generally straight and erect; although one large species (*B. agrestis*), common in dry mountainous situations in the south-east of Asia, has crooked, and sometimes creeping stems. The stems grow to their full height unbranched, but afterwards throw out straight horizontal branches, especially in their upper parts, forming a dense thicket; and many of them being strongly armed with spines, they are planted for defence, presenting a formidable barrier, even against regular troops. Some of the smaller kinds are often planted as hedges. The stems are jointed

Bamboo.

like those of other grasses, very hard, but light and elastic, hollow, containing only a light spongy pith, except at the joints or nodes, where they are divided by strong partitions. They are, therefore, readily converted into water-vessels of various sorts; and when the partitions are removed, they are used as pipes for conveying water. They are also much employed for house-building, for bridges, and for many other purposes to which wood is usually applied. The smaller stems are converted into walking-sticks, and are imported into Europe under the name of B. Cane, both for that purpose and to be employed in light wicker-work. Some of the species grow to the height only of a few feet; and almost all of them are slender in proportion to their height, although *B. Guadua*, a native of New Granada and Quito, has a trunk 16 inches in diameter. The stems of different species vary also very much in the thickness of the woody part, and their adaptation to different purposes. The covering of the stem is, in all the spec ably silicious; the stem of *B. tabacaria* that it strikes fire when the hatchet is This species is a native of Amboyna and Java slender stems are polished, and used for the stall tobacco-pipes. The leaves of some kinds are for thatch, and the Chinese plait hats of them the external membrane of the stems of some make paper. From the knots of the B. there ex a saccharine juice, which dries upon exposure to atmosphere, and which the Greeks called *I Honey*. It is also sometimes named *Tabari sheer*; but this name more properly phosphorescent substance, containing and possessing remarkable properties, in the joints of some species of B., al large grasses growing in dry situations. SHEER.—The young shoots of some kinds of B. eaten like asparagus, or are pickled in vi Those of *B. Tulda*, a common Bengalese specie used for these purposes when about 2 feet The seeds of some species are used as rice making a kind of beer. Bamboos are very rapid growth, and they are oft situations, which would otherwise vegetation. It is not improbable that the be employed, where they do not naturally to render districts productive which are no else than deserts, in climates like those of A the north of Africa, and Australia; and the qu of the grain of different species seems to de more attention than it has ever receiv species common in the West Indies (*B.* supposed to have been introduced fr Indies. A few species are found in the an altitude of 12,000 feet, and a dwarf that region has been successfully tried air in England.

BAMBOU'K, a country of Senegambia, We Africa, lying in the angle formed by the Se and Faléme rivers, in N. lat. 12° 30'—14° long. 10'—12° 30'. Its extent, howe been accurately ascertained, but is mated at 140 miles in length, and in breadth. It is populated by are ferocious and cruel in the e is sultry and unhealthy, especially duri season. Low ranges of mountains cove portion of the surface of B. The valleys, which are subject to remarkable for their fertility. 'MPTON LECTURES. These lectures are ...lled after the name of their founder, the ... John Bampton, Canon of Salisbury, who left ... originally worth £120 per annum, to the ...rsity of Oxford, for the ... of eight ...ty-lecture sermons, to ... at Great ...ary's every year, and ... at the expense of the estate, within two months of their being preached. The preacher is to lecture on one of the following subjects: The Confirmation of the Christian Faith, and the Confutation of all Heretics and Schismatics; the Divine Authority of the Scriptures; the Authority of the Primitive Fathers in Matters of Christian Faith and Practice; the Divinity of Christ; the Divinity of the Holy Ghost; the Apostles' and Nicene Creeds. No person is qualified to preach these lectures who has not taken the degree of M.A., either at Oxford or Cambridge, and the same person shall never preach them twice. The first course was delivered in 1780. In 1834 and 1835, no lecturers were appointed, and no lecture was preached in 1841. With these exceptions, there has been an unbroken series of very valuable, but rather learned than popular, discourses. The most remarkable are the following: Those delivered in 1784, on Christianity and Mohammedanism, by Dr White, who was accused of having obtained assistance in their composition from Dr Parr and Dr Badcock; those by Dr Tatham in 1790, on the Logic of Theology; those of Dr Nott in 1802, on Religious Enthusiasm this series was directed against the pretensions of Wesley and Whitefield those of Dr Mant in 1812; those of Reginald Heber in 1815; Whately in 1822; Milman in 1827, Burton in 1829, on the Heresies of the Apostolic Age; Soames in 1830, on the Doctrines of the Anglo-Saxon Church. But of the whole series, none have caused greater excitement and controversy than those delivered by Dr Hampden in 1832, on 'The Scholastic Philosophy considered in its Relation to Christian Theology.' They were attacked on all sides, but especially by the leaders of the Oxford Tract Association. Hampden was accused of Rationalism and Socinianism. When he was appointed Regius Professor of Divinity in 1836, a petition against his appointment was sent up to the throne; and upon this being rejected, a censure was passed upon him in convocation by a large majority, declaring his teaching to be unsound, and releasing undergraduates from attendance at his lectures. Notwithstanding this, he was raised to the see of Hereford in 1847, under the government of Lord John Russell—thirteen of the bench of bishops protesting against the appointment. There has been a recent course of B. L., delivered by Henry Longueville Mansel in 1858, on 'The Limits of Religious Thought,' which have caused a less bitter, but scarcely less interesting controversy. Mr Mansel possessed great power as a dialectician, and his lectures contained many very eloquent passages. The main position which he took up was, 'That the human mind inevitably, and by virtue of its essential constitution, finds itself involved in self-contradictions whenever it ventures on certain courses of speculation,' i.e., on speculations concerning the infinite nature of God. He maintained that all attempts to construct an objective or metaphysical theology must necessarily fail, and that the attainment of a philosophy of the Infinite is utterly impossible, under the existing laws of human thought—the practical aim of the whole course being to show the 'right use of reason in religious questions.' Mr Mansel was accused by his critics of condemning *all* dogmatic theology (e.g., all creeds and articles), and of making revelation itself impossible. Mr Maurice has been one of his principal opponents. The B. L. for 1859 were delivered by Geo. Rawlinson, the subject being *The Historical Evidences of the Truth of the Scripture Records, stated anew*. Canon Liddon's lectures in 1866, on our Lord's Divinity, have been the most important recently delivered.

A course of lectures similar to the Bampton was

founded about the same time at Cambridge, by the Rev. John Hulse. See HULSEAN LECTURES.

BAN. This word occurs in most of the modern languages of Europe, and its primary signification appears to have been, 'to make a signal' (see BANNER), 'to proclaim' or 'publish.' This meaning it retains in the phrase, *bans* or *banns* (q. v.) of marriage. In Germany, the *acht* or *bannum* was a sentence of outlawry pronounced in the middle ages against those who escaped from justice, or refused to submit to trial. We often read of refractory princes, and even cities, being placed under the *ban of the empire*. The following are the terms of banning used in an old formula: 'We declare thy wife a widow and thy children orphans; we restore all thy feudal tenures to the lord of the manor: thy private property we give to thy children; and we devote thy body and flesh to the beasts of the forest and the fowls of the air. In all ways and in every place where others find peace and safety, thou shalt find none; and we banish thee into the four roads of the world—in the devil's name.' Besides these sentences of outlawry, many other announcements were accompanied with denunciations and imprecations. When a grant of land was made for a religious purpose, or when a charter of liberties was granted, the transaction was proclaimed in public with certain ceremonies, and curses were denounced against any one who should violate the deed. Thus *banning*, or publishing, came to be associated with cursing; and hence the origin of the popular use of the word. It occurs in this sense in Shakspeare and Milton, and other old writers.

BAN; ARRIÈRE BAN. Besides the civil use of the word ban, as a proclamation or prohibition, there was a military application of the term in former days in France. When the feudal barons, who held their estates and honours from the king, were summoned to attend him in the time of war, they were called the *ban*, or the levy first called out; while the tenants, subordinate to these barons, formed the *arrière ban*, or secondary levy.

BAN, or BA'NUS, supposed by some to be a contraction of the Illyric word *Bojan*, i. e., lord, but more probably another form of the Slavonic word *Pan*, which possesses the same signification. Formerly, it was a title given to some of the military chiefs who guarded the eastern boundaries of the Hungarian kingdom, and was therefore synonymous with the German *Markgraf*. The ban, who was appointed by the sovereign, but not for life, and whose appointment had to be ratified by the national diet, had originally very extensive, in fact, almost unlimited powers. In political, judicial, and military affairs, he was the supreme authority. Within his own territory, he exercised an influence similar to that of the Palatin in Hungary, and only lower than a king. In time of war, he headed the troops of his *Bezirk* (q. v.), and if the campaign occurred within its limits, it was his duty invariably to occupy the post of danger. He led the van to battle, or covered the rear in retreat. For these services, he was recompensed partly in ready money, and partly by a monopoly of salt. The most important banats were those of Dalmatia, Croatia, Slavonia, Bosnia, Machow, and Szoreny, but their boundaries changed so frequently, that at the present day it is impossible to ascertain what they originally were. The encroachments of the Turks in the 16th c. rendered the union of the various banats necessary; and after some time, the whole were formed into the double banat of Dalmatia and Croatia. A still more complete unity was subsequently obtained by centralising the military power. In 1723, the authority of the B. was made entirely subordinate to that of the supreme government of Hungary. After many vicissitudes, his powers, rights, and titles strictly defined during the reign of Maria Th He was then acknowledged to be the third dig of the Hungarian kingdom, appointed a mem the Hungarian council of government, and pre of the council of the banat, and at the corona the Hungarian king went before him, bearin golden apple, the symbol of sovereignty. Sim the position of the ban until the 4th of March when Croatia, Slavonia, and Dalmatia were formed into Austrian crown-lands, and the wholly independent of Hungary, and endo the same extensive powers as the governors crown-lands, but retaining, nevertheless, his title. During the disturbances in H Hungary, in 1848, the Ban Jellachich (q. v.) important service to the Austrian emperor.

BANA'NA, a fruit originally East Indian, much cultivated in warm countries over the w globe. It is now generally regarded as a variety of the Plantain (q. v.); although they formerly ranked by botanists as distinct species Plantain under the name of *Musa Paradisiaca*, the B. of *M. sapientum*—the specific name signif 'of the wise men,' and being intended to conv allusion to a statement by Theophrastus concer a fruit which served as food for the wise India, and which, from his description, is s to have been the plantain or banana. The plantain and B. are somewhat vaguely used

Banana.

application to different cultivated ties. are very numerous; those called B. dark purple stripes and spots on th the fruit is smaller, less curved, and o taste than the plantain, with a soft pulp. Each fruit is generally about inches long. The B. is always used in and never like the plantain, as a sub bread; unless when the pulp is squeezed fine sieve, and formed into small los when dried, may be kept for a great le but which are saccharine, and not fa is sometimes fried in slices; it is preserves; and its juice affords an ex It has been produced of good quality in Britain.—The fruit of *Musa* (is sometimes also called banana. See Pl

'NA BIRD (*Xanthornus Icterus*), a beauti- ..ru, allied to the Baltimore Bird (q. v.), which ..nsiderably exceeds in size; a native of the West s and warm parts of America. Its colours ..awny and black, with white bars upon the . It is very lively and active. It is gregari- ..d a number of the nests may often be seen each other, suspended to the extremities of er branches of trees, so as to be out of the ..s of snakes and monkeys. It is often kept in ..ses to destroy insects. It is very easily domesti- ..ated, and delights to be caressed.

BA'NAT, any district or territory under a ban, but specially applied to a province of the Austrian empire, which has, curiously enough, *no* ban. It is bounded on the W. by the Theiss; on the S., by the Danube; on the E., by the line of mountains which separates Hungary from Walachia and Transylvania; and on the N., by the Maros. It consists of the three Comitate, Temesvár, Torontál, and Krassowa. Pop. (1869) 1,028,263. It is partly mountainous and partly flat, but is everywhere copiously watered, and exceedingly fertile. The chief rivers are the Temes and Karasch. The climate is warm in summer, and comparatively cold in winter; but, though not unpleasant, it is far from salubrious in the west, on account of the swamps and morasses which abound. Nevertheless, it is the most productive of the Austrian provinces, yielding rich crops of wheat, spelt, and other grains; the vine is little cultivated. Wild-fowl are numerous, and the rivers swarm with fish. The mines are valuable; coal, iron, copper, gold, silver, and zinc being procured in considerable quantities. The mineral springs of Mehadia are in great repute. The principal town is Temesvár.

B. belongs to the Hungarian portion of the Austrian Empire. It was formed into an Austrian crown-land in 1849, but was restored to Hungary in 1860.

BA'NBRIDGE, a small town in the west of Down county, Ireland, on a steep slope on the left bank of the Bann, 76 miles north of Dublin. It is a thriving seat of the linen manufacture in all its stages, from the preparation of the soil for the flax-seed to the finishing of the finest linen. Miles of bleaching-greens exist in the vicinity, and numerous factories along the Bann. Pop. (1871) 5599.

BA'NBURY, a small town in the north of Oxfordshire, on the right bank of the Cherwell, 23 miles north of Oxford. There formerly existed here a very strong castle, which was built about 1125, and sustained various sieges during the early English civil wars. At Danesmore, near B., the Yorkists were defeated in 1469. B. is the centre of the famous rich red land of Oxford county. This land is among the most fertile in the kingdom. A system of canals connects the town with all parts of England. The vicinity of B. is thickly studded with villages. Numerous remains of the ancient Britons are found in the neighbourhood. B. is noted for its manufacture of agricultural implements, and for its malt liquors, cheese, and cakes. There are also manufactures of plush, shag, girth, and other webbing. B. returns one member to parliament. Pop. (1871) of municipal borough, 4122; of parl. borough, 11,726.

BANC, legally, is a seat or bench of justice, and in this sense has given rise to the expression of the courts of law at Westminster 'sitting in banc,' or *in banco*—that is, sitting together on the bench of their respective courts, in term-time, and otherwise, as is provided by statute.

BA'NCA, an island north-east of Sumatra, 1° 30'—3° 5' S. lat., and 105° 10'—106° 53' E. long., has an area of 6883 square miles. Pop. (1871) 153 Europeans and 41,748 natives and Chinese. Gold, iron ore, silver, lead, and amber are found, and the tin exported to Java for Holland averages 4200 tons. The sales in 1872 had a value of £533,137.

BA'NCO (It.), a commercial term meaning the standard money in which a bank keeps its accounts, as distinguished from the current money of the place. The distinction was more necessary when the currency consisted, as it often did, of clipped, worn, and foreign coins. These the early banks (Venice, Amsterdam, &c.) received at their intrinsic worth, and credited the depositor in their books with this bank-value. The term is now chiefly applied to the money in which the Hamburg bank keeps its accounts, which is not represented by any coinage. The Hamburg Mark B. (=1s. 5½*d.* sterling=15½ Prussian S. groschen) is to the current mark (=1s. 2½*d.*=12½ S. groschen) as 20 to 16. Sweden has also a peculiar bank-money, 8 dollars B. being equal to 3 dollars specie. Genoa had at one time a bank standard, and the present current money being different from that, is still called 'fuori banco,' outside the bank.

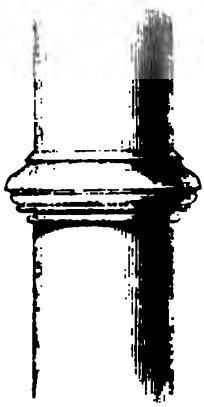
BA'NCROFT, GEORGE, American historian, born 3d October 1800, near Worcester, in Massachusetts, was the son of Dr Aaron Bancroft, an eminent Unitarian minister. He entered Harvard College at the age of 13, and obtaining a valuable exhibition there, proceeded in 1818 to Gottingen, where he studied history and philology under Heeren, Plank, and Eichhorn, and in 1820 obtained the degree of doctor. At Berlin, he attended the lectures of Hegel, and had frequent intercourse with Schleiermacher, W. von Humboldt, Savigny, Varnhagen von Ense, and other literary men of note. Subsequently, he travelled through Germany, and formed an acquaintance with Goethe and Schlosser. Having visited Paris, London, and Italy, B. returned to America, and after some time spent in tuition, devoted himself to politics. He soon became celebrated as a democratic politician, and was made collector of customs at Boston. He still continued his literary labours, especially in lectures upon German literature, philosophy, &c. When Polk was elected president, in 1845, he appointed B. secretary of the navy. While in this office, he established an observatory at Washington and a naval school at Annapolis. In the autumn of 1846, B. was sent by Polk as ambassador extraordinary and plenipotentiary to England, where he remained till 1849, carefully collecting materials for a *History of America*. He published the result of his labours in his *History of the Revolution in North America* (Boston, 1852). He had already published his *History of the Colonisation of the United States of North America* (3 vols., Boston, 1834—1840). The whole of these writings are included in the author's *History of America*, a work of solid excellence, the 10th and last vol. of which appeared in 1874. In 1866, B. delivered an oration in honour of Abraham Lincoln. From 1867 to 1871, he was Minister Plenipotentiary at the court of Berlin. For some years he was a principal contributor to the *North American Review*.

BA'NCROFT, RICHARD, Archbishop of Canterbury, and a bitter opponent of the Puritans, son of John B. and Mary, niece of Hugh Curwyn, Archbishop of Dublin, was born at Farnworth, Lancashire, in September 1544. Educated at Cambridge, he took the degree of B.A. at Christ's College in 1567, and that of M.A. at Jesus' College in 1570. He became rector of Teversham, Cambridgeshire, in 1575, of St Andrews, Holborn, in 1584, and treasurer of St Paul's Cathedral in 1585. In the latter year, he was admitted D.D. By the Lord Chancellor, Hatton, to whom he was chaplain, he was presented

to the rectory of Cottingham, Northamptonshire. In 1589 he became a prebendary of St Paul's, in 1592, of Westminster, and in 1594, of Canterbury. Consecrated Bishop of London, May 8, 1597, he attended Queen Elizabeth during her last illness. At the famous Hampton Court Conference under James I., he was one of the chief commissioners on behalf of the Church of England, and took the lead in the disputations. In the convocation of 1603—4, he sat as president. In October 1604, he succeeded Whitgift as Archbishop of Canterbury; and was sworn in one of his majesty's privy council in September 1605, and chancellor of the university of Oxford, 1608. He died November 2, 1610. B. had a high character as a preacher and statesman; and was a vigilant ruler of the church. He is author of two sermons, one of which, preached at St Paul's in 1588, contains a furious invective against the Puritans, and of two treatises respecting church order and discipline. B. left his library to his successors in the see of Canterbury for ever. —His nephew, JOHN B., Bishop of Oxford, 1632, died 1640, built the palace of Cuddesden for the bishops of that see. Burned by the parliament troops, 1644, it was rebuilt, 1679.

BAND, or BANDS, a portion of clerical dress, and the only relic of the ancient *amice*, a linen vestment which was used in the ancient church to cover the shoulders and neck of the priest. It also forms a part of the full dress of the bar, the universities, and the leading functionaries in schools of old foundation. At Winchester and some other schools, it is even worn by the scholars themselves. The bands worn by lawyers and other civilians, may be a relic of the wide stiff collar which was a part of the ordinary civilian dress in the reign of James I.

BAND, in Architecture, is the name given to any kind of ornament which is continued horizontally along a wall, or by which a building is encircled. Bands often consist of foliage, quatrefoils, or of simple bricks. *B. of a shaft* is the moulding or suits of mouldings by which the pillars and shafts are encircled in Gothic architecture. Several bands are often placed at equal distances on the body of the shaft, when it is long, in which case they are known as shaft-rings.



Band of a Shaft.

BA'NDA, chief town of a district in Bundelcund, in lat. 25° 28′ N., and long. 80° 23′ E. In 1872, its population was 27,573. It is a great mart for cotton. It is situated on the right bank of the Cane or Keyn, an affluent of the Jumna, being 95 miles to the south-west of Allahabad, 560 to the north-west of Calcutta, and 190 to the south-east of Agra. The district of B. contains 3030 square miles, and 696,443 inhabitants.

BA'NDAGES are used by surgeons to apply pressure on a part, or to retain dressings upon wounds. The most common bandage is a strip of linen, calico, or elastic web, from 3 to 5 or more inches in breadth, rolled longitudinally; hence the name *roller*. There are also B. to suit special purposes, as the four-tailed for the head or knee, which consists of a piece of cloth split up on each side towards and nearly to the centre. When applied, the tails are crossed and tied so as to make an extemporaneous night-cap. In applying the roller

Bandage.

bandage to a leg, the surgeon first turns it round the foot, then round the ankle; and so by repeated turns, each one of which should overlap about a third of the previous one, till he reaches the calf of the leg, when he must fold at each turn the bandage sharply back on itself, by which manœuvre the bandage will lie flat and smooth on the limb. The operator must remember that the bandage must be applied more tightly at the foot than in the leg, so that it may not impede the course of the blood through the veins. This requires to be practised, as the effect of a bandage is always for good or evil as it is well or ill applied.

BA'NDA ISLES, a portion of the Moluccas, consisting of 12 islands, 6 of which are inhabited, about 50 miles to the south of Ceram. Pop. (1870) of Banda and Amboyna, 236,737; of the former alone probably about 110,000. Their mean lat. and long. respectively are 4° 30′ S., and 129° 50′ E. Their chief production is the nutmeg, the annual export of that spice being about 1,000,000 lbs., with a corresponding quantity—about one-third—of mace. Like most of the islands in this neighbourhood, they belong to the Dutch. They are lofty and volcanic.

BA'NDA ORIE'NTAL, a state of South America. See URUGUAY.

BANDA'NA, a kind of printed handkerchief of Indian origin, now extensively made in Britain, usually of cotton. The cloth is first dyed Turkey red, and then the pattern is made by discharging the colour with bleaching liquor in a powerful Bramah press. The pattern to be discharged is cut out on two plates of such metal (lead) as may not be acted on by the liquor, and of the full size of the handkerchief. A dozen or more are put in at once between the plates, and so many of these couples are entered together as fill the press, when the pressure is applied, and the liquor is run in on the uppermost plate, which is grooved on the upper side to receive it, and holed to pass it from plate to plate through all the cloth-folds in the press. The pressure on the cloth to make clean work by preventing the spreading of the liquor, is enormous. The patterns in the real B. style of printing are spots and diamond prints, the best suited for discharging, and even for these a pressure of 800 tons is required to work them clean. See CALICO PRINTING.

BA'NDEL, ERNST VON, an eminent modern sculptor, was born in 1800, in Anspach. While attending the academy at Munich, he prosecuted his studies so diligently that in 1820 he sent to the exhibition a plaster figure of Mars reposing, as large as life, which procured for him considerable reputation

Of various models of this kind done by him, one, a figure of Charity, was executed in marble. This work occupied the artist about ten years. It exhibits great chasteness of design, and a minute carefulness of execution. Among his best portrait busts, in which he excels, are those of Maximilian, king of Bavaria (1832), and of the artists D. Quaglio and Peter Hess. In 1834, he removed to Berlin, where his chief works were a colossal statue of Hermann, the foundations of which were laid in 1841, but which was not completed till after 1862; a life-size statue of Christ; a life-size statue of Hermann's wife; and a bust of the poet Grabbe. For Hanover, where he has chiefly resided of late years, he has executed the statues of Shakspeare and Goldoni for the theatre, and other works. For Gottingen, he executed a statue of William IV.

BANDE'LLO, MATTEO, an Italian writer of *novelle* or tales, was born at Castelnuovo in Piedmont about the year 1480. In early life, he became a Dominican monk, in the Convent delle Grazie at Milan, but soon abandoned this vocation for a more free and independent life. His uncle, who had been elected general of the order in 1501, took him to travel with him; and in Rome and Naples, B. devoted himself to the study of belles-lettres. He then returned to Milan, whence he was driven by the Spaniards, as a partisan of France, after the battle of Pavia in 1525. He accompanied Francis I. to France, and was, in 1550, made bishop of Agen by Henry II. He left the care of his diocese to the Bishop of Grasse, in order to be able to devote himself without disturbance to the completion of his tales, which he published in the Italian language in three volumes (Lucca, 1554), to which a fourth was added after his death, which took place in 1561. The tales of B. rank next to those of Boccaccio in Italy. They are distinguished by unaffected simplicity of style, fluency and vividness of narrative, and a harmonious brevity of periods. It must be confessed, however, that they are not unfrequently very impure in tone. B. wrote several other works.

BANDE NOIRE ('Black Band') was the name given, during the first French Revolution, to the societies of capitalists who bought the confiscated buildings which had belonged to the church, emigrants, &c. The opprobrious name was fixed on them on account of their vandalism in the destruction of old relics, works of art, churches, convents, abbeys, episcopal residences, &c., many of which possessed both a scientific and historical interest. It has, however, been alleged, on the other hand, that these societies have frequently done considerable service to the community, in removing old and useless edifices, and that their minute subdivision into lots of the old territorial domains, has both favoured agriculture and ameliorated the condition of the people.

Banderole.

BA'NDEROLE, a small streamer fixed immediately under the crook, on the top of the staff of a crosier (q. v.), and folding over the staff.—Also an architectural term for the flat inscribed band used in the Renaissance buildings, similar to those now used for mottoes to coats-of-arms.

BA'ND-FISH, or SNA'KE-FISH (*Cepola*), a genus of fishes of the Ribbon-fish (q. v.) family. The body is much elongated and compressed. The bones are little more solid than a mere fibrous net-work, and everything else exhibits a corresponding delicacy, so that specimens are seldom to be obtained in an uninjured state. All the species inhabit quiet depths, and are incapable of contending with waves and currents. Their singular form, and the beauty of their colours, make them objects of great interest. One species, the Red B. (*C. rubescens*), not uncommon in the Mediterranean, is occasionally cast ashore by storms on the British coasts. It is about fifteen inches long. Its brilliant appearance, when seen moving in the water, has suggested the names of Fire-flame and Red Ribbon, by which it is known at Nice.

BA'NDICOOT (*Perameles*), a genus of marsupial (q. v.) quadrupeds, occupying in the zoology of

Bandicoot.

Australia a place somewhat analogous to that of shrews (q. v.) in Europe. Their dentition is remarkable, as they have ten cutting teeth in the upper jaw, and only six in the lower, the posterior ones of which are two-lobed: in other respects, it nearly resembles that of opossums. They have an elongated head and pointed muzzle; the hind-legs are considerably longer than the fore-legs; the thumb and little toe of the fore-feet are little more than simple tubercles, so that there seem to be only three toes; and there is a fleshy tubercle in place of a thumb on the hind-feet. Their movements are similar to those of hares or rabbits. They live on bulbs, insects, &c., make ravages in potato-fields, and devour corn in granaries. There are several species. The Long-nosed B. (*P. nasuta*) is about a foot and a half in length from the extremity of the nose to the origin of the tail, which is not unlike that of a large rat, but better covered with hair. It is chiefly found in the mountainous parts of New South Wales. *P. Gunnii* is common in Van Diemen's Land.

BA'NDICOOT, BA'NDICOOT RAT, MALABA'R RAT, or PIG-RAT (*Mus giganteus*), the largest known species of rat. The name B. is a corruption of the Telinga *pandikoku*, literally signifying pig-rat. The animal inhabits many parts of India, and is plentiful in Ceylon. It is chiefly found in dry situations, and often in hilly districts. It attains the weight of two or three pounds, and is 24–30 inches long, including the tail, which at the base is 2½ inches in circumference. The body is thick, and greatly arched, black above, grayish below. Its flesh is a favourite article of food with the coolies of India, and is said to be delicate, and much to resemble young pork. It feeds chiefly on grain and roots, and is very destructive in gardens. 'Its nests, when rifled, are frequently found to contain considerable quantities of rice, stored up against the dry season.'—Sir J. E. Tennent's *Ceylon*.

BANDIE'RA, ATTILIO and EMILIO, two brothers well known for their tragic fate, were descended from a distinguished aristocratic family of Venice, which had once held a place in the red book of the republic. They were lieutenants in the Austrian navy, their father being rear-admiral; but, instead of sharing the pro-Austrian sentiments of their parent, they cherished enthusiastic dreams of the free and

united republic of Italy. In the year 1842, they entered into correspondence with Mazzini, whom they regarded as almost a demigod. Their glowing and enthusiastic patriotism breathes in every line of their letters. Both were noble spirits, ready for any sacrifice, but unfortunately impressed with the delusive idea that their native country could be saved by means of a conspiracy. Emilio, the younger, of a stronger bodily frame, but of a lighter disposition, was under the influence of his graver and more thoughtful brother. In the year 1843, they believed that the time was come for a revolution by force of arms; but their premature appeal finding no practical response, they fled to Corfu in March 1844, where they endured many bitter disappointments and much misery. Hope alone inspired them with life; but at length, misled by false rumours of a rising in Naples, with which it is supposed the Neapolitan police had something to do, they ventured to land with twenty companions at the mouth of the small river Nieto, in Calabria, believing that their appearance would be the signal for a general insurrection. The Neapolitan government expected them; one of their companions, a certain Boccheciampe, had betrayed them. They were attacked by an overwhelming force, and were nearly all taken prisoners at once. One only fell on the spot, and two escaped. Nothing was ever allowed to transpire respecting the trial of these unfortunate men. Attilio and Emilio were shot along with seven of their comrades in the public square of Cosenza, on the 25th July 1844. They died joyfully, exclaiming 'Viva l'Italia!' The public mind had not then become accustomed to hear of bloody deaths for political causes. A cry of indignation resounded through Europe at this 'kingly revenge,' as it was called in a conservative paper of the day. A year later, their remaining companions were pardoned. The fate of the brothers B. attracted much attention in England, from the circumstance that letters of M. Mazzini, then in London, had been opened in the post-office by authority of government, which was accused of giving such information to the Italian governments as enabled them to entrap the insurgents.

BANDINE'LLI, Baccio, the son of a famous goldsmith of Florence, and one of the best sculptors of his time, was born at Florence in 1487. His first instructions were probably received in the workshop of his father, for in those days goldsmiths wrought from their own designs. He was afterwards a pupil of Rustici, and the friend of Leonardo da Vinci. He was an angry and jealous rival of Michael Angelo, whose grandeur of conception he strove to equal, and who is said to have retaliated his enmity by contempt. It must be admitted, however, that we have only prejudiced sources from which to draw our information regarding him. Benvenuto Cellini, whose language is generally passionate and hyperbolical, is his chief accuser, although Vasari also speaks of his proud and envious disposition. Whatever may have been his moral infirmities, it is impossible to deny that, as a sculptor, he was in his day second only to Michael Angelo. His feuds with his brother-artists do not appear to have injured him in the opinions of persons of distinction. He was patronised by Cosmo de' Medici, Charles V., Francis I., Clement VII., and other powerful friends. Clement even bestowed on him an estate. He died at Florence, 1559—1560.

His best works are bassi-rilievi, among which are those that adorn the choir of the Duomo at Florence. On the high-altar in the same building is to be seen his Corpse of Christ, supported by an angel, with God the Father, over it. His most ambitious work is Hercules with Cacus at his feet. In the Medicean Gallery are his copies of the group of the Laocoon—a masterly imitation of the antique, in which he boasted that he excelled even the ancients themselves. He also executed statues of some of his patrons; all his works exhibit power, vigour, and skilful drawing, but it is alleged, apparently with considerable truth, that 'he was too fond of the terrible graces of composition.'

BA'NDIT, a word originally signifying a 'banished' or outlawed person; then one who, because outlawed, wages war against civilised society; and finally, a highway robber. The bandit, or banditti, formed in Italy in earlier times, as it were, a separate community or guild, who submitted to their own stringent laws, carried on both open and secret war with civilised society, and kept up a certain romantic idea of honour. By means of the severe measures which were adopted in 1820 by the papal government against the banditti and their abettors, their bands were broken up. Those who still occasionally disquiet the frontiers of Naples are in general people settled on the spot, who regard robbery and murder as equally a branch of their trade with agriculture. Peter the Calabrian, one of the most famous B. chiefs in 1812, assumed the titles of 'Emperor of the Mountains, King of the Woods, and Lord of the Highroads from Florence to Naples.' The government of Ferdinand I. found themselves obliged to conclude treaties with him. The banditti must be distinguished from common robbers, who were called *Malviventi*. In later times, the banditti were joined by adventurers of all kinds, to such an extent, that the Austrian troops who occupied Naples were obliged to make frequent expeditions against them. In Sicily, the banditti are most numerous in the Val Demone. They formerly acquired so much power there, that the Prince of Villafranca, as a piece of policy, declared himself their patron, and treated them with much confidence. In the years 1841—1843, political fugitives united with robbers and adventurers of all kinds in the Abruzzi, Calabria, and Romagna, and since then they have never been entirely extirpated. The revolutions of 1848—1849 added greatly to their numbers, and in several districts of Italy, especially in the States of the Church, between Ferrara and Ancona, they reached an unheard of degree of boldness, notwithstanding the Austrian army of occupation. Under the command of one Bellino (known by the name of 'Il Passatore'), a daring and talented man, who died in March 1851, they kept the country in terror, and even burned several villages to the ground. They also carried on a real guerrilla warfare against the military forces of the country. Recent events in Italy, have, it is said, recalled numbers of these banditti to a more honourable course of life.

BANDOLEE'R, or BANDALEE'R. Two centuries ago, soldiers' muskets were provided with *matchlocks*, a very slow and ineffective contrivance for firing. The musketeers were furnished with gunpowder in small cylindrical boxes made of wood, tin, or leather, each containing sufficient for one charge. Twelve of these little boxes were fixed to a belt called a *bandoleer*, worn over the left shoulder. In what way these were superseded by a superior arrangement, will be found noticed under Cartridge.

BA'NDOLINE is a mucilaginous substance used for stiffening hair, and keeping it in shape or form. It is much used by ladies in the present prevailing mode of wearing the hair, and by gentlemen, to dress their moustaches. The usual receipt for making the B. sold in the shops is to boil Carragen

v.) or Irish-moss with water till a thick mucilage obtained, which is afterwards scented with *Eau* ...*gne* or other perfumed spirit; a second mode preparing B. is to soak quince-seeds in cold water ... a day or two, then strain, and add perfume; and a third process is to heat gum tragacanth with water, and when a mucilage is obtained, add the scent.

BANDON, a town of Ireland, county Cork (q.v.).

BANDO'NG, a commercial town on the west coast of Java, in the vicinity of the volcano Gunong Guntour, by an eruption of which eighty villages were destroyed in 1822.

BANDS, MILITARY, consist each of a body of ...d musicians, attached to a regiment in the ... service. According to military regulations, ... indispensable instruments are drums, fifes, ... and trumpets, all of which are employed to ... als on the march or in active service, either ... in ...try or for cavalry. To supplement this musical establishment, however, the officers ...nents organise, chiefly at their own cost, ... military bands, who use a variety of instru- ...-such as flutes, clarionets, bassoons, horns, ...ides, big drums, cymbals, triangles, &c. This ... ment has assumed almost the force of ... ...tion; for officers above the rank of subaltern ...bliged to contribute a sum not exceeding ...ive days' pay in the course of a year, and an ... sum when promoted, to the band fund. The ...ers of these bands are selected from the ranks; ... band-master, though in uniform, is often ... n who is hired for the purpose, and who ...y refuses to accompany the regiment abroad, ... at an increased rate of remuneration. The ..., generally, are in an anomalous position; ...ast serving in the band, their pay, and ... lly their pensions, are restricted to those ... private soldier. Good musicians have at ... a tendency to quit the B.; their better ...prospects as teachers, and players in orchestras and ...concerts, induce them to obtain release by paying ... amount of compensation prescribed by regulation. ...mpt made by the Duke of Cambridge in 1856, ...e the commissioned officers of part of the ... entailed upon them by the present system, ... and matters remain as they were. In most ... regiments of the line, the band consists of a ... ...ster and about fifteen musicians; but in the ...choice corps the number is often much larger. When ...a regiment consists of two or more battalions, the band goes with the first. The band plays on parade at mess, as a part of regular duty. When M. ... play at festivals, concerts, &c., 'by permission of commanding-officer,' the payment goes to the ...icians; and the chance of obtaining these fees ...one of the inducements to the men to remain in a ...e which has very few attractions in relation to ... d regular amount of pay. The bands of the ...e regiments of foot-guards—Grenadier, Cold- ...eam, and Scots Fusilier—are very frequently engaged in this way during the London season.

BA'NEBERRY. See ACTEA.

BANFF (pron. Bamf), the capital of Banffshire, a seaport in the north of the county, on the left bank of the mouth of the Doveran, 45 miles by road, and 50 by rail, north-north-west of Aberdeen. It forms a higher or inland town, and a lower or sea town, on the Moray Firth. On a height between the towns are some remains of a royal castle, on the site of which is now a large house - the 'Castle.' To the east of B. is Duff House, the seat of the Earl of Fife, with a large park. The harbour is liable to be sanded up. A seven arched bridge over the Doveran unites B. with the seaport of Macduff, half a mile to the east. The chief exports are corn, cattle, salmon, and herrings. In 1872, 429 vessels of 70,386 tons, entered the port. Pop. (1871) 7439 in B., and 3407 in Macduff. In 1873—1874, valued rental, £9947 in B., and £5021 in Macduff. B., with Elgin, Cullen, Inverury, Kintore, and Peterhead, sends one member to parliament. Robert II., in 1372, made B. a royal burgh. Archbishop Sharp of St Andrews was born here in 1613. Macpherson, a noted robber, was executed here in 1700. Some houses and much property in B. were destroyed by the August flood in the Doveran in 1829.

BA'NFFSHIRE, a county in the north-east of Scotland, bounded N. by the Moray Firth; E., S.E., and S. by Aberdeenshire; W., by Elgin and Inverness shires. It stands fifteenth among the Scotch counties in size, and fourteenth in population. Its greatest length is about 68 miles, its greatest breadth about 32 - average 12; its extent of sea-coast about 30; estimated area, 686 square miles. The surface, especially in the south and south-east, is mountainous, interspersed with fertile valleys and fine pastures; but the surface near the coast is comparatively level. The chief mountain-ranges, rivers, and strike of the stratified rocks, run from south-west to north-east, and the whole county is an extensive slope in the same direction, from the Grampians to the Moray Firth, into which the rivers flow. The coast is rocky, but not high, except to the east of Banff. The highest peaks are the North Cairngorm, 4090 feet; Ben-a-Main, 3874; Ben Rinnes, 2763; Corryhabbie, 2569; Knock, 1416. Ben Muicdhui, 4296 feet, is partly in Banffshire. The chief rivers are the Spey, which bounds a third of the county on the west; and the Doveran, 60 miles long, and mostly included within the county. The predominant rocks are granite, quartz rock, mica-slate, clay-slate, syenitic greenstone, graywacke, graywacke-slate, old red sandstone with fossil fishes, metamorphic limestone, and serpentine. The serpentine near Portsoy has long been famous as the 'Portsoy Marble.' Beryl and rock-crystal occur on Cairngorm. Lead, iron, antimony, and plumbago occur in small quantity. The soil in many parts is very fertile, and highly cultivated. In 1873, a third of the surface of B. was in crop, the chief crops being oats, turnips, and grass. The breeding of cattle is the chief object of the farmer. In 1873, B. had 6994 horses, 43,595 cattle, 47,699 sheep, and 2880 pigs. The chief manufactures of B. are weaving, bleaching, tanning, distilling, and artificial manures. Glenlivet whisky has long been celebrated. The chief exports are grain, meal, and cattle. There are twelve fishing towns and villages along the coast. The herring-fishery is extensively carried on. The salmon-fisheries of the Spey and Doveran are very valuable, the Spey ranking after the Tweed and Tay as a salmon-river. B. is divided into the districts of Enzie, Boyne, Strathisla, Strathdoveran, Balveny, Glenlivet, and Strathavon. The chief towns and villages are Banff, Macduff, Portsoy, Keith, Cullen, Buckie, Dufftown, and Tomantoul. Pop. in 1871, 62,023, with 107·7 females to every 100 males; 84·79 per cent. of the children between the ages of 5 and 13 were receiving education. There are 23 civil parishes in the county, and 81 places of worship (of which 33 belong to the Established Church, and 24 to the Free Church). Valued rental of county, £295,919. The parliamentary constituency in 1873–1874 was 2418. B., along with the counties of Aberdeen and Elgin, enjoys the Dick Bequest (q. v.) for parochial education. Two-thirds of B. belong to four landed proprietors. The county returns one member to parliament, and Banff and Cullen unite with Elgin, Inverury, Kintore, and Peterhead in returning another. B.

contains numerous remains of antiquity, the most remarkable being the old churches of Gamrie and Mortlach. The former, built in 1010, and used for public worship till 1830, is called the 'Kirk of Skulls,' the bones of the Norsemen who fell on the neighbouring field of Bloody Pots having been built into its walls. Mortlach was for a century the seat of a bishop, but David I., in 1139, incorporated the see with that of Aberdeen.

BANGALO'RE, a fortified town of Mysore, situated 70 miles to the north-east of Seringapatam, in lat. 12° 58′ N., and long. 77° 38′ E. It is the chief military station of the British in the territory. It has a manufacture of silk; but that of cotton is, or has been, far more important, having been at one time estimated to employ 3000 looms. The population of B. was (1872) 142,513. As the place is 3000 feet above the level of the sea, the thermometer, during six successive years, is said to have risen only twice above 90°, and then only to 92° and 93°. During the same period of time, the lowest temperature was 61°. B. was a favourite residence of Hyder Ali; and, in 1791, it was stormed by the British under Lord Cornwallis. Water is good and abundant; and the usual vegetables of Europe come to maturity in the gardens.

BANGKO'K, the capital city of Siam, is situated on the banks of the Meinam, about 20 miles from the mouth of that river, in the Gulf of Siam, and in lat. 13° 38′ N., and long. 100° 34′ E. The population is about 500,000, about half of whom are Chinese,, in whose hands is centred nearly all the trade of B., which is large, as is shewn by the commercial returns. The exports in 1871 were 6,132,913 dollars; in 1872, 6,684,390 dollars. The imports in 1871 amounted to 4,509,461 dollars; in 1872, to 5,247,729 dollars. For their right to trade here, the Chinese pay a poll-tax of about three dollars on entering the kingdom, and a similar sum is collected from them every three years. The payment of this tax exempts them from the half-yearly servitude which all other oriental strangers resident in Siam are required to give. The approach to B. by the Meinam, which can be navigated by ships of from 200 to 300 tons burden, is exceedingly beautiful, the banks being skirted by fine trees full of gay birds. As the town is neared, numerous temples present themselves, and floating-houses become common; and finally, the whole city, with its rich gardens, and shining temples and palaces, bursts full upon the view. A large number of the houses float on rafts, and can be transferred from one place to another at pleasure. There are a few houses in the city built of brick and stone, but the greater part are of wood. There are usually in each house a division for males and one for females. The land-houses are raised upon piles, 6 or 8 feet from the ground, and are reached by rude ladders—the daily flow of the tides and the annual inundations rendering this plan necessary. The floating-houses are made of bamboo-boards, wicker-work, or palm-leaves, and have generally a verandah in front, with a small wing at each end. The circumference of the walls of B., which are 15 feet high and 12 broad, is said to be 6 miles. The internal traffic of B. is chiefly carried on by means of canals, there being only a few passable streets in the whole city. Horses and carriages are rarely seen except in the neighbourhood of the palaces. The chief interest of the kingdom of Siam, according to Sir John Bowring, concentrates itself in Bangkok. B. is the constant residence of the two kings of Siam and their respective courts. The palace of the first king is surrounded by high walls, and is nearly a mile in circumference. It includes temples, public offices, accommodation for some thousands of soldiers, with their necessary equipments, a theatre, and rooms for about 3000 females, 600 of whom are the wives of the king. The sacred white elephant has also a place within the palace. Throughout the interior are distributed the most costly articles in gold, silver, and precious stones. The palace of the second king, whose functions are not very clearly defined, is nearly as large as that of the first king, but not so ostentatious. See SIAM. The temples of B. are innumerable, and decorated in the most gorgeous style, the Siamese taking a pride in lavishing their wealth on them. Some of them, according to the Catholic bishop Pallegoix, have cost more than 4,000,000 francs (£160,000). In the neighbourhood of B. are iron-mines and forests of teak-wood. The chief exports are sugar, pepper, cardamoms, ivory, feathers, hides, fine woods, rice, salt and fish. By the treaty concluded by Sir John Bowring in 1855, the Siamese reserve the right to prohibit the exportation of salt, rice, and fish, in cases of threatened scarcity. The imports are tea, manufactured silks and piece-goods, opium, hardware, machinery, and glass wares. In 1872, 336 vessels of 132,012 tons entered, and 294 of 136,148 tons, cleared the port. See Sir John Bowring's *Siam*.

BA'NGOR, an episcopal city, borough, and seaport town in the north-west of Caernarvonshire, North Wales, on the south-east bank of the Menai Strait, 2½ miles from the Britannia Bridge, and 59¾ west of Chester. It consists chiefly of a narrow crooked street, a mile long, stretching south-west through a narrow fertile valley, bounded on the south by steep precipices. The grandeur and beauty of the surrounding scenery has long made it a favourite resort, and the opening of the Chester and Holyhead Railway, on the great line of communication from London to Dublin, has greatly promoted its prosperity. The town has of late years been greatly improved, and mostly rebuilt. Its chief trade is derived from the great slate-quarries of Llandegai, 6 miles distant, and employing 2000 men. The slates are exported to all parts of the world, and also manufactured at B. into tables, chimney-pieces, &c. Pop. 9838. B. unites with Caernarvon, Conway, Criccieth, Nevin, and Pwllheli, in sending one member to parliament. B. is a place of great antiquity. In 525, St Deiniol founded a college here. It was raised to a bishopric in 550, the founder being the first diocesan. The cathedral founded by him was destroyed by the Saxons in 1071, rebuilt in 1102, and again destroyed by fire in 1402. The present edifice, built between 1496 and 1532, is a plain embattled cruciform structure, 214 by 60 feet, with a pinnacled tower 60 feet high. Several Welsh princes and distinguished ecclesiastics are buried here. B. bishopric is the oldest in Wales.

BA'NGOR, a small seaport town in the north-east of Downshire, on the south side of the entrance to Belfast Lough, and 12 miles east-north-east of Belfast, with which it is connected by rail. Pop. (1871) 2356. It has linen and cotton manufactures, and the embroidering of muslin is carried on. Cattle and provisions are exported. Coal is found in the neighbourhood. It is a favourite watering-place of the middle classes of Belfast. St Cungall, in 555, founded Bangor Abbey ('Ban-choir,' the 'White Choir,' whence the name Bangor), of which the ruins still remain. From this abbey, Alfred selected professors when he founded the university of Oxford. In the 9th c. it had 3000 inmates.

BA'NGOR, a city in the state of Maine, 221 miles north-east of Boston, on the right bank of the Penobscot, about 60 miles from its mouth, and at its confluence with the Kenduskeag, which intersects the

city, and affords an extensive supply of water-power. At spring-tides, which here rise 17 feet, the harbour is accessible from the sea for the largest vessels, and as the navigation cannot go higher, B. is one of the largest lumber depots in the world, absorbing and monopolising the trade of the heavily timbered basins of the Penobscot and its tributaries. About 2000 vessels are annually employed in the trade. B. possesses several churches, a theological seminary, foundries, planing and sawing mills, &c. There are 2 daily and 4 weekly newspapers. Steam-boats run between B. and the adjacent ports of Portland and Boston, and it is a station on the Penobscot and Kennebec Railway. Pop. (1870) 18,290.

BANGO'RIAN CO'NTROVERSY. Dr Benjamin Hoadley, Bishop of Bangor, in a sermon preached before George I., March 31, 1717, on the text, 'My kingdom is not of this world,' advanced opinions regarding the constitution of the church which excited strong opposition from the zealous advocates of ecclesiastical authority. A controversy ensued, which was carried on with great heat for many years, and resulted in a ponderous collection of pamphlets. See HOADLEY.

BA'NGOR-ISCOE'D (Bangor below the Wood), an inland village, beautifully situated, in a fertile and richly wooded country, on the right bank of the Dee, on the borders of Flint and Denbigh shires, North Wales, 5 miles south-east of Wrexham. Pop. between 500 and 600. It was once the seat of one of the largest monasteries in Britain. This monastery was founded before 180 A.D., and contained 2400 monks in the time of St Augustine, in the end of the 6th c., when they distinguished themselves in resisting the claims of the papal see. Ethelred, king of Northumbria, in 593, devastated the monastery, and massacred 1200 of the monks.

BANIALU'KA, a fortified town of Bosnia, European Turkey, situated on the left bank of the Verbas, with a manufactory of gunpowder, and numerous bazaars and public baths. Pop. 8000.

BA'NIAN or **BANIA'N** (from the Sanscrit *banij*, a merchant), a word used in India to designate a merchant or trader generally. It is more particularly applied to the great merchants in the west of India, especially in the seaport towns of Bombay, Surat, Cambay, &c., who carry on a very extensive trade by means of caravans, with the interior of Asia, even to the borders of Russia and China. Contrary to the general custom of the Indian people, these merchants travel much, and the establishments and counting-houses of Indian Banians are to be found in almost every commercial town of any note in Asia. The banians form a class or division of the caste (q. v.) of the Vaisya, adopt a peculiar costume, and are strict in the observance of fasts and in abstaining from the use of flesh.

BA'NIAN DAYS, a sailor's phrase, nearly equivalent to the *jours maigres* of the French. The term denotes the days when no meat is served out to a ship's crew. How far this is likely to occur in the royal navy, or the mercantile marine, will be found noticed under VICTUALLING. The term is derived from the practice of the Banian (q. v.) traders.

BA'NIAN-TREE. See BANYAN.

BANIM, JOHN, a celebrated Irish novelist, born 1800, whose pictures of manners, in the form of tales, have excited considerable interest in England. His aim was to become for Ireland what Scott had been for Scotland. He has given proof of vigorous intellectual grasp and vivid fancy, in a series of pictures of life, in which he delineates the peculiarities of the Irish character in strong light and shade, and appeals forcibly to the national feeling. His *Tales of the O'Hara Family* (London, 1825) were followed, in 1826, by a second series, which did not disappoint the high expectations excited by the first. Of these, several have been translated into German by Lindau. Next appeared *The Battle of the Boyne*, *The Croppy* (1828), *The Denounced* (1830), *The Smuggler* (1831), *The Mayor of Windgap*, *Father Connell*, &c. In 1837, general sympathy having been attracted towards B.'s privations, occasioned by disease that precluded all literary exertion, a pension of £150 per annum from the civil list was awarded him by government, which was afterwards further increased by £40 for the education of his daughter, an only child. He died in poverty on the 1st August 1842, at Windgap Cottage, near Kilkenny.

B. failed in his attempt to portray the manners and frivolities of the higher classes; but none of his predecessors, such as Edgeworth, Morgan, and Crofton Croker, have succeeded in depicting so vividly and truly the Irish peasant, with his picturesque peculiarities in his sufferings and errors. Although generally happy in the plot and development of his story, he is too much disposed to dwell on the horrible. His denunciations may be well founded, but they disturb the poetic effect. B. was also not quite free from a somewhat tiresome minuteness of description, and his imitation of Scott is frequently very palpable.

BA'NISHMENT, excepting in the penal sense of Transportation (q. v.), with which it is popularly synonymous, can only now be said to have a legal meaning historically. Formerly, in England, parties who were required to *abjure the realm*—that is, renounce and depart from the country—were, so to speak, *banished*; but the word appears to have a more technical and precise significance in the Scotch law than in the English, and in Scotch law-books, is defined as the punishment of exile from Scotland inflicted on persons convicted of certain offences for which that punishment is provided. But as a punishment, it has either been abolished in that country by express enactment or become obsolete by disuse. See TRANSPORTATION, PENAL SERVITUDE.

BA'NISTER, a corruption of Baluster (q. v.).

BANJERMASSI'N, a large kingdom on the south-east of Borneo, has an area of 7880 square miles, and a pop. of about 150,000 souls, chiefly Mohammedans. Since 1860, it is governed by the Dutch Resident for the south and east of Borneo, who has an assistant at Martapura, where the sultans formerly lived. B. is watered by large rivers and intersected by a chain of mountains, in several parts rising to 3000 feet. Excellent small-arms are manufactured. The products are pepper, wax, edible nests, rattans, benzoin, dragons' blood, coal, iron, diamonds, and gold dust.

B., the capital of the residency, is built on the island Tatas, about 12 miles from the mouth of the Banjermassin or Barito; pop. 35,000. In 1871, the pop. of the residency numbered 326 Europeans and 847,846 natives. There is a considerable trade in native products, and the imports are piece-goods, gunpowder, rice, sugar, Chinese porcelain, silks, and a few horses from Java.

BANK, BANKING. A banker is the custodier of the money of other persons. Such is his business, viewed in its simplest aspect. A banker, if he hoarded the money deposited with him, would be simply a cash-keeper to the public; his bank would be literally a bank of *deposit*. Even were the business of banking limited to the keeping of deposits, it would be of no small advantage to society: the depositors would be relieved from the care of their money, and in many cases, from the trouble of handing

it to those to whom they required to make a payment. If the person to whom the depositor wishes to pay money intend also to deposit it, a transfer in the books of the banker from the one to the other, made on the order or *cheque* of the depositor, would effect the payment. The money itself would lie undisturbed. The Bank of Amsterdam, as it existed in the 17th c., was a bank of deposit, pure and simple. But the business of receiving money on deposit has almost always been, and is now, universally, combined with that of lending it out. A banker does not hoard all the money deposited with him—he gives the greater portion out in loan. The lending of money is as much a part of his business as the receiving of deposits. The advantages accruing to society from the operations of banking are thus immense. A million of money lent out to be used, and which otherwise would have lain dead, either in small portions in the repositories of the owners, or in one large hoard in the coffers of the banker, makes the world one million the richer—or at least prevents it from becoming one million the poorer; for money, so long as unused, serves no end as a means of exchange. With the money thus lent out, manufacturers can purchase raw material to be worked up, and procure food and clothing for their workmen; and traders can go into the markets and purchase commodities for resale. Commodities are thus more quickly turned to useful purposes, and a stimulus is given to the production of more. But a banker deals not with the money only of others; he uses money belonging to himself. This is his *capital*. Few would be found to deposit their money with a person known to possess none of his own. If he should lend deposits to those who fail to repay them—that is, *make bad debts*—he has the means from his capital of replacing the deposits thus lost. Such, then, are the simple functions of a banker: he borrows and lends.

But for the money he lends he receives interest from the borrowers; and in this interest he is paid for his trouble in taking charge of the deposits, and for his risk of bad debts. The services that a banker performs as the cash-keeper of his depositors are very great. In the case of persons not themselves in business, it is quite usual for a banker to make all their money-payments, beyond their small daily expenditure, and to receive the money payable to them. The money transactions of such persons are thus contained in their banker's books. This is effected by the depositor giving a cheque or order on his banker for the sums he has to pay; and by handing to him all the *cheques* or orders the depositor receives for sums payable to himself. Suppose a person's income derived from dividends on government stock: he sends a *power of attorney* or authority to his banker to uplift the dividends for him. These are received by the banker as deposits, and are drawn out by the depositor as occasion occurs, by cheques issued by the depositor to those to whom he requires to pay it away. So he may receive money due to him by a cheque given to him by his debtor. This cheque he sends to his banker, who will obtain payment. If both persons deal with the same banker, a simple transfer in his books will carry through the transaction; and if the bankers be different, and each has had received, in the course of his business, as is always happening, a cheque on the other, there will be a set-off between them; and two payments will be made as well as two deposits, without trouble to the persons concerned, and without the employment of any money. But this mode of managing one's pecuniary transactions is not confined to the case of those not engaged in business; on the contrary, it is followed on a scale out of all proportion greater in carrying through the money transactions of those in business or trade in the principal industrial countries.

Besides thus performing the function of cashiers to their depositors, in consideration of the profit made on their deposits, many banks allow their depositors interest on their deposits. The rate allowed is, of course, always less than that received by the banker. Frequently a depositor bargains with the banker not to draw out his deposit without previous notice, longer or shorter as may be agreed on; and in this case the banker will allow a higher rate of interest than when the deposit is repayable *on call*—that is, at any time, without previous notice. The practice of allowing interest on deposits always obtained in Scotland, but in England is of later growth. It has led there, of late years, to a great increase in the amount of deposits, especially, it is believed, of small sums. Where banks allow interest on deposits, it is quite common for persons to lodge their money with them, solely for the sake of the return received in the shape of interest from the banks. These persons prefer the low rate of interest which banks give, to the higher rate which may be obtained from individual borrowers, or to the greater return which may be received if they traded on their money. The low rate of interest is compensated for by the greater security, and the absence of trouble and labour to the depositor.

Occasions are always occurring for withdrawing deposits, as well as making them. Traders and commercial men, for example, day by day, deposit with their bankers the drawings or sums of money which they receive in the course of their business; and, on the other hand, day by day, draw out such sums as they require to pay away in purchases of goods, in wages, rent, and other expenditure. A bank, therefore, while continually receiving deposits, is continually repaying deposits; and the amount uncalled for is subject to a daily fluctuation. At one period of the year, or in a certain condition of trade, the amount of deposits may be high; at another, low. As it is a principle, at the very root of banking, that money deposited shall be returned, either on demand, or punctually at the expiry of a stipulated notice, it follows that banks must always have in their coffers as much of the money deposited with them as there is the least likelihood of being called for by depositors. When business is in its ordinary condition, a bank can, after some experience, approximate pretty nearly to the amount of the greatest demand for a return of deposits throughout the year, and provide accordingly. But sometimes the credit of a bank becomes doubted, either from causes peculiar to itself, or on occasions of a *panic* or general distrust, when all who own money wish to have it in their own possession. In these cases, there is a run on the bank for repayment of its deposits, and the amount called for may be far beyond the maximum demanded in ordinary times. If the bank has not retained as much of the deposits in its coffers as meet the demand, it is said to *suspend payment*, and, as a general rule, it must wind-up its business; the confidence of the public that it will in future restore its deposits on demand being now destroyed. There are two prime rules in safe banking: the one is, that the bank shall lend its deposits only on good and undoubted securities, however low the profit; and the other is, that the bank shall retain a sufficient amount of its deposits—and this is called the *reserve*—to meet the possible demands of the depositors, even in cases of a run, although there may be no reason to expect a run or unusual demand; for when a run comes, it seldom casts its shadow before. But it is evident that the greater the *reserve* of a bank, the less the amount of deposits

which it is lending out and drawing interest for; hence the temptation which banks lie under of imprudently lending out a too great proportion of their deposits; and it is their yielding to this temptation which almost always precipitates the failures of banks.

The *reserve* of the banking department of the Bank of England is always in coin, or, what is the same thing, in notes against which there is coin lying in what is called the *issue* department of the Bank. In the case of all other banks in this country, the reserve is only partly in coin; sometimes the proportion of coin is very small. A great portion of the reserve is generally in Bank of England notes, equivalent, of course, to coin. These other banks also hold a portion of what is truly their reserve, in the shape of government stock, in which they have invested it. In this way, the banks obtain a return on this last portion of their reserve, in the dividends or interest paid by government on the stock—this return being less, indeed, in the usual case, than if the bank had lent out the money in the ordinary course of business, but better than no return at all, as must be when the coin or notes are lying idle. The reason why government stock, in Great Britain, is a safe reserve is, that it is sure to command a purchaser at all times. If there be a run on a bank, it immediately finds a purchaser for the stock, and with the price, whether paid in gold, or in Bank of England notes, the only other legal tender, it meets the demands of its depositors. Sometimes, a bank has its reserve in the form of a deposit at the Bank of England; or, if a provincial bank, with some London bank which has its own reserve there. From the Bank of England being the channel through which, directly or indirectly, payments are made, and moneys received, by other banks, it is more convenient for them to have their reserve lying as a deposit in it, than lying as gold within their own walls. In the case of a demand on their reserve, the banks will draw out their deposits, in notes, or, if gold be in demand, in gold, from the Bank of England. Whether, therefore, the reserve of a bank is invested in government securities, or is deposited in the Bank of England, or is in Bank of England notes, it is from the coin in that bank that the gold comes in the case of a run. It is apparent from this that it is essential to the stability of all banks in this country, so long as they themselves do not keep a sufficient reserve of coin in their coffers, that the Bank of England shall always be possessed of coin, and never be unable, on demand, to pay its depositors in gold, or to give gold in exchange for all its notes that may be presented to it. It may be added, that while banks gain, through the annual dividends, in keeping their reserve in government stock, they run the risk of a loss in the event of their requiring to sell it in the time of a panic. For at such a time, when many securities and stocks become unsaleable, and all of them suffer depreciation in value, government stock itself falls in price, although less so than the others. Banks often invest portions of their reserve in other stocks than government stock. The higher return obtained on these other is, however, outweighed by the greater risk of depreciation in their value, whether continued unsold or thrown into the market for sale in times of panic.

We have hitherto been treating banks as banks of *deposit* and *loan*; but many of these banks, in all countries where banks are known, are also banks of *issue*. Banks of deposit, as has been mentioned, make loans from their capital and deposits. If from capital, the banker has no greater profit by the transaction than if he had lent out his money in any other way, equally safe, and involving the same amount of trouble. If from deposits, the interest he receives, in so far as it exceeds the interest, if any, paid to the depositors, and a rateable proportion of the expense of carrying on the business of the bank, is pure gain to him. But a banker may give the loan from his own notes, and in that case his gain is still greater. A bank-note is simply a written promise by the bank issuing it, to pay to the bearer, on demand, a sum of money—that is, in coin of the realm. Of course, the borrower would not accept a loan from a bank in its own notes, unless he believed that it could redeem its promise of paying in coin, and that the public were of the same opinion; for the moment that a suspicion arises that the promise will not be made good, the note will cease to pass from hand to hand as coin, or to perform all the functions which coin performs. But when the loan is accepted in a bank's own notes, it is evident that the interest which the bank draws for the loan of its promises to pay is pure profit, except the rateable proportion—as in the other cases—of the expense of carrying on its business, and the expense of the paper and printing of the notes with the government stamp-duty. In other words, a bank which can get people to pay to it interest for the loan of its promises to pay, draws the same income- barring the comparatively trifling expense of manufacturing the written promises—as a bank does which has to provide itself with gold for making its loans. The motive which a bank has to extend its issues on loans is therefore apparent, so long, of course, as it is not compulsory on it to retain unemployed in its coffers as much in gold as it issues in notes.

But it by no means follows that when a bank makes a loan in its own notes for a definite period, it will really obtain the benefit of the interest on it for that period; for the borrower does not apply for the notes that he may keep them beside him, but that he may pay them away in making a purchase, or in liquidating a debt, and this, most commonly, on the very day he receives them. If the person to whom the notes are thus paid by the borrower has himself no purchase to pay for, or no payment to make, he may, the moment he gets them, return them to the bank that issued them, to be there on deposit. If the bank pays interest on deposits, as most banks do, then out of the interest drawn by it on the original loan, it will have to pay interest to the depositor of the notes; in other words, the loan is no longer a loan of its notes, but a loan from its deposits. Or, the person receiving the notes from the borrower, may immediately present them to the issuing bank for coin, instead of depositing them. Here, too, therefore, the loan that was made in notes is now converted into a loan of coin, that was in reserve from previous deposits, or that was part of the bank's own capital; in which cases, the bank obtains no advantage whatever in having made the loan originally in its notes. It might equally well, so far as profit is concerned, have originally made it in gold from its reserve of deposits or capital. Notes generally find their way back to the bank that issued them through other banks, into which they have been paid as deposits, or for the liquidation of debts due to them. These banks suffer the loss of profit or interest on the amount of the notes thus received by them so long as they keep them; they therefore immediately present them to the issuing bank for gold, to replenish their own reserves, or to lend out; or, what is the same thing, they present them to the

issuing bank for government stock, or other securities bearing interest, and which that bank has had to provide from its capital and deposits.

It will now be apparent to the reader that there are two checks which prevent a bank issuing notes to any extent it pleases. In the first place, there must be a demand for its notes by borrowers. It is only to people in good credit, and likely to make a profitable use of them, that a bank will lend its notes, and such people will not take an increase of loans unless trade be increasing, and new opportunities be presenting themselves for profitably employing the notes borrowed. True, banks, when imprudently conducted, or when deceived in the character of their customers, frequently lend their notes to reckless persons, who overtrade with them, and become bankrupt. But banks commit this error, when they do commit it, to a far greater extent by loans of their deposits and capital, than by loans of their notes. In the second place, the immediate return of the notes, chiefly through other banks for gold, or for other portions of the reserve of the issuing bank, is a check to its issuing more notes than it has a reserve to meet. This return of notes through banks is called the *exchange* of notes—the notes issued by a bank being returned to it in exchange for the notes held by it of another bank.

Besides issuing its notes in loans, a bank may issue them in repayment of deposits. In this case, there is the same profit to the bank as in the other case. The bank gets the profit which it makes on the money which was originally deposited or lodged with it, without having to pay interest to the persons who made the deposit or lodgment; the deposit, or money lodged, having now been repaid in its notes. But here, too, these notes are equally liable to be returned to the issuer as when they are issued on loans.

Of all the notes issued, in whatever way, by banks, a certain amount is not returned to them, but is kept in circulation, being what is required by the necessities of the public for use as money, passing from hand to hand. It is of course on this portion that the banks make their profit; and, in consequence of this profit, they are able to afford banking facilities to the public more cheaply than they could otherwise do. The profit is just the interest on the notes in circulation—less the expense of manufacturing the notes, a rateable proportion of the expenses of conducting the banks, and the loss of interest or profit on an unemployed reserve kept from prudence, or by the requirement of law, to meet a return of notes. This interest is paid by the persons who originally borrowed these notes from the banks, and who have not repaid them; or if the banks have repaid deposits with the notes, the interest is paid by those to whom they lent what was originally these deposits. The amount of the bank-notes in circulation varies at different periods of the year: at term-times and quarter-days, when more payments than usual are made, there is a greater quantity of money required by the public than at other times, and the notes in circulation increase in amount. This addition to the circulation is drawn from the banks by depositors or borrowers. After it has served its purpose, this additional quantity gradually returns to the banks as deposits or in repayment of loans. If the credit of an issuing bank is at any time suspected, the holders of notes will present them for gold, just in the same way as its depositors will call for a return of their deposits; and a bank requires to provide itself with a reserve—on which, of course, it makes no profit—to meet a *run* from its note-holders, as well as a *run* from its depositors. It has been generally imagined that when issuing banks suspend payments on a run, the run is one on the part of their note-holders; but this is only a popular error. In a well-established bank, the amount of its notes in circulation is almost nothing compared to its deposits; and though the holders of small sums in notes may be more apt than depositors to take alarm and rush in a panic to the bank for gold for its notes, a small proportion of its depositors suddenly demanding a return of their money in gold, as effectually drains a bank of its reserve, as if its whole circulation were to be at once presented to it for gold.

Banks make their loans chiefly in the form of *discounts;* that is, upon bills of exchange. Commodities in the wholesale market are generally sold on credit. The buyer promises to pay the amount at a certain date to the seller, and his promise is contained in a bill of exchange. The seller transfers it to a bank, which, on the faith of it, advances the amount in loan to him, less *discount*, that is, interest of the money till the bill be due. This is called *discounting*. But banks lend on other securities. A holder of government stock, for example, will obtain a loan on the security of his stock; the banker being entitled to sell it, and repay the loan from the price, if the borrower fail to make punctual payment. So also, the holder of stock or shares in any public company, as a railway company, or of a debenture or bond due by such, will, where the company is believed to be in a sound condition, or the security is saleable, obtain a loan from a bank. The owners of commodities lying in a public warehouse, may obtain a loan on depositing with the bank the *warrants* or certificates of ownership. Loans, too, are occasionally made for short periods on the mere note of hand of the borrower, when the banker is satisfied of the ability of the borrower to repay the money. It is seldom in this country that banks lend on mortgages over land. Borrowers, in these cases, generally take loans to lie unpaid for a few years; but to have his money locked up in that way does not suit the trade of a banker. Where a banker finds the security which he has received to be insufficient, and repayment of the loan is not forthcoming, he will, of course, like any other trader, to avoid making a bad debt, take any other security the debtor can give him—such as a manufactory or a mine. Banks have in this way frequently become involved in manufacturing transactions, in their attempts to make more money of the securities than they would have done by an immediate sale of them; they have become manufacturers and miners, and suffered great loss in consequence. And it is not to be supposed that banks always abstain from making loans when the security is known to be doubtful; far from it: banks, like other commercial establishments, have been, in many occasions, recklessly managed. In trying to push business, they have made loans on insufficient security, and banks are under strong temptation, to which they frequently yield, when a trader largely indebted to them is approaching bankruptcy, to sustain his credit by additional advances, in the hope that he may retrieve his affairs, and pay in full both the old and the new advances. The result is often the loss of both. Conduct of this kind has been the ruin of many banking establishments in England, of two or three in Ireland and Scotland, and elsewhere.

Bankers perform another very important function: they *remit* money from one place to another. One illustration will serve to explain how this is managed. A debtor in Edinburgh makes a payment to his creditor in London in this way: he pays the money to a banker in Edinburgh, who, for a small charge, called the *exchange*, gives him a draft for the amount on a banker, his correspondent, in London.

The debtor transmits the draft to his creditor, who presents it to the London banker, and receives the money from him. No actual transmission of the money, however, takes place, for there are debtors in London requiring to pay money to creditors in Edinburgh, and these debtors effect the payment by paying the money to the London banker, and obtaining his drafts on the Edinburgh banker. The one set of drafts are thus set off against the other. Not only may remittances between two places be thus made without the use of money, but the payments to and by the parties in both places may also be made without it. The debtors may pay for the drafts by cheques on the banker who grants them, and the creditors may receive the money by drawing cheques on the banker by whom the drafts are made payable.

The large amount of money transactions carried through without the intervention of coin or bank-notes, in a country like England, is inconceivable to those not engaged in business pursuits. The manner in which these transactions may be effected without money, would be at once apprehended, if all persons in the same locality dealt with the same bank, and if all the banks scattered throughout the kingdom were only branches of the same establishment. But in practice, matters are so managed as if this were the case. The cheques, bills, or other drafts which come into the hands of a banker, drawn on (that is, payable by) other bankers, are set off and liquidated by drafts, which they have received, drawn on him. The balance or difference only is paid in money. In London, the centre of the money-world, there is an establishment called the Clearing-house (q. v.), of which most of the London banks are members. There, at a fixed hour daily, attendance is given by a clerk from each of these banks, who presents all the drafts immediately payable which his bank holds on the others; the balance or difference, on the whole, for or against each bank is ascertained; and the bank which holds a less amount of drafts on others than they hold on it, pays the difference by cheques on the Bank of England. The lowest weekly clearing during 1873, was £79,207,000, and the highest £161,770,000. There are clearing-houses in some of the provincial towns, conducted on a similar principle.

Bank of England.—This institution, which is the largest and most important banking establishment in the world, was projected by William Paterson, a Scotsman, and received its charter of incorporation July 27, 1694. It was constituted as a joint-stock association, with a capital of £1,200,000, which sum was lent at interest to the government of William and Mary, at the time in a state of embarrassment. From its very outset, therefore, the Bank of England was a servant of government; and in a lesser or greater degree, it has enjoyed this character through all the stages of its subsequent history. At first, the charter of the Bank was for eleven years only; but in consequence of the great services of the institution to government, its charter has been at various times renewed. The last renewal was in 1844, and the charter of that year still subsists, its term being subject to modification or revocation by the legislature at pleasure. By the act or charter of 1844, the Bank was divided into two departments—the *issue* and the *banking*. What led to the division was this: it was supposed that, when a foreign drain of gold from us set in, it would, if the currency or circulation in this country had been purely metallic, have produced a contraction of the circulation, and a consequent fall of prices, and, as an ultimate result, the cessation of the drain. It was further supposed that banks could issue their notes to any extent they pleased; that their excessive issues increased the currency, and therefore increased prices, which in their turn led to foreign drains; and that, on the occasions of these drains, the continued issues prevented the natural and desirable contraction of the circulation, and aggravated the commercial convulsions occurring at such periods. The object of the act of 1844 was to prevent issues of notes beyond a certain amount, unless against an equal amount of gold held by the issuing bank, so that the mixed currency of notes and coin might thus expand and contract like a self-acting metallic currency. Experience, however, has shewn, that when these foreign drains occur, the gold exported is taken chiefly from the reserves in the Bank of England, being withdrawals of deposits or loans by the Bank; and that the amount of notes in the hands of the public has not been affected by the legislation of 1844. In practice, whenever there are signs of a foreign drain, and the reserve of the Bank is diminishing, the Bank counteracts the tendency to a drain by raising the rate of discount and restricting its loans; the purchasing power of the public is thereby limited, and prices kept down; and, at the same time, gold is attracted to this country for investment. The circulation is in reality not interfered with. It was also intended by the act of 1844 to add to the security of bank-notes by insuring a supply of gold to meet the payment of them at all times. But the solvency of the Bank of England is undoubted; its notes would at any time be taken as gold; and this effect of the act of 1844, and the supplementary act of 1845, has in the case of the notes of other banks been hitherto inappreciable.

In the *issue* department of the Bank of England, its sole business is to give out notes to the public. Before the separation of the departments, the government was due to the Bank £11,015,100. This sum was declared to be now a debt due to the issue department, and for the issues of notes to that amount, no gold requires to be held by it. This was just the same thing as if the Bank had originally lent £11,015,100 of its notes to government, and these notes had found their way into circulation. The Bank was also allowed to issue additional notes on securities—that is, to lend them to a limit which at present amounts to £3,984,900, and this also without holding gold. The amount of notes which may thus be issued, without gold being in reserve against it, is £15,000,000. All notes issued above that amount can be issued only in exchange for gold. At the passing of the act in 1844, the limit of notes to be issued against the government debt and securities was fixed at £14,000,000—past experience having shewn that there was not the least risk of there being at any time less than that amount of Bank of England notes in the hands of the public. The addition of the £1,000,000 is an extra issue, authorised by the act, in consequence of certain issuing banks having since ceased to issue. The Bank has to account to government for the net profit of this issue loan of notes of £1,000,000, and the profit the Bank derives from its issue department is the interest received on the £14,000,000 of government debt and securities, which, at 3 per cent., is £420,000 yearly. But out of this the Bank pays to government, for its banking privileges, and in lieu of stamp-duties, £180,000. If we assume the expense of the issue department to be £160,000, the net profit upon it would be £80,000. The Bank also makes a profit upon bullion and foreign coin. These are brought to the Bank for notes; they are worth £3, 17*s.* 10½*d.* per ounce; but the Bank is obliged by its charter to purchase them at £3, 17*s.* 9*d.* The holders prefer taking this price to having their bullion and foreign coin coined, free of charge, at the public mint, as the delay in the

coining is equal to a loss of interest of 1½*d.* per ounce. The amount of notes in the hands of the public averages about £25,000,000; but the amount issued by the *issue* department is greater. The difference is the amount lying in the *banking* department, and represents the reserve of gold of that department; that is to say, the banking department retains only a half or three-fourths of a million of coin, and transfers the bulk of its reserve to the issue department, in exchange for notes. We therefore require to regard the reserve of the banking department as gold, though lying in the shape of notes issued by the other department.

Viewed in its *banking* department, the Bank differs from other banks in having the management of the public debt, and paying the dividends on it; in holding the deposits belonging to government, and in making advances to it when necessary; in aiding in the collection of the public revenue, and in being the bank of other banks. For the management of the public debt, the Bank receives about £247,000, against which there has to be set £124,000 of charges. The remaining profits of the Bank are derived from its employment, like other banks, of its deposits, on which it allows no interest, and of its own capital. The capital was originally £1,200,000; in 1816, it reached £14,553,000—the present amount. There is besides a rest of above £3,000,000. During the year 1873, the public deposits varied between £16,730,000 and £3,880,000, and the private deposits between £22,960,000 and £16,490,000.

In 1797, the Bank found itself likely to be obliged to suspend payments, and its notes were declared by law a legal tender, although no longer convertible into coin. This state of matters continued till 1821. The notes during this interval not having been convertible into coin on demand, there was no check upon the Bank in the amount of its issues; and the currency became depreciated—that is, a £5 note would not exchange for five sovereigns; and every man to whom £5 was due, was thus obliged to accept payment in a £5 note, not worth £5. It is, however, said that the value of gold at the time was enhanced owing to absorption by hoarding and by military-chests, and that the depreciation was more apparent than real. The export of gold following on a rise of prices occasioned by an issue of bank or government notes is unlimited, except by exhaustion, if these notes are not payable in coin on demand, and are issued without any check from without or self-imposed. But as prices estimated in these notes rise, the price of bullion, like other commodities, rises too, and the price of coin which can be converted into bullion, or be used abroad at its previous purchasing power, rises also. Since 1821, the Bank has been oftener than once on the verge of a suspension of payments, owing to foreign drains of gold. The separation of the Bank into two departments is regarded by many as having a tendency to produce a suspension in times of panic, when the reserve is reduced by withdrawals to supply a foreign drain, or to meet an internal run. Before the separation, the Bank, in the case of withdrawals of gold, had the whole amount of gold within the Bank to meet them; but now it loses the command of all the gold in the issue department. It cannot get that gold unless in exchange for notes, but, its reserve being reduced or exhausted, it has none to spare. The restriction of credit consequent upon the approach to an exhaustion of the reserve of the banking department, is so great, that the fear of it occasions a panic; and in 1847, 1857, and 1866, on the possible suspension of payments by the banking department, owing to a reduction of its reserve, being apparent, the government of the day took the responsibility of authorising the Bank to lend additional notes, not represented by gold, which was an indirect way of getting at the gold in the issue department, where the object of the borrowers was to obtain gold. In 1857, it was found necessary to take the benefit of this authorisation.

The Bank of England is situated in the centre of London; but it has a branch in the west end, and several branches in the provinces.

Joint-stock Banks in England and Wales.—There are 120 of these banks, of which 56 in the provinces are entitled to issue notes to the extent of £2,730,669, without its being compulsory to hold any gold in reserve against them. Their actual issue is considerably less. The deposits of the joint-stock banks in London are above £90,000,000. All of them, except the Cheque Bank, allow interest on deposits. The Cheque Bank, which was recently established, receives deposits without doing any other banking business. For the amount lodged by a depositor, it supplies to him blank forms of cheques for sums limited from £1 to £10 each, to be issued by him, as if money. The receiver of one of those cheques, is, from its nature, assured that funds have been lodged in the Cheque Bank to meet it when presented.

Private Banks in England and Wales.—Of these, there are 255, of which 57 are in London. Of the provincial banks, 117 have a fixed authorised issue of £3,874,621.

In the case of all these banks, whether issuing or non-issuing, their profits are chiefly derived from the use of their deposits.

There are also in London 58 foreign, Indian, and British colonial joint-stock banks.

Banks in Scotland.—The earliest banking institution in North Britain was the Bank of Scotland, instituted by a charter of incorporation from the Scots parliament in 1695. The original capital was £1,200,000 Scots, or £100,000 sterling. The amount was raised by shares differing in extent, from £1000 Scots, or £83, 6*s.* 8*d.* sterling, to £20,000 Scots. In 1774, the amount of stock was extended to £200,000 sterling: now it is £1,000,000 sterling, and the shares £100 sterling.

The Bank of Scotland continued to be the only bank in the country till the year 1727, when a new and similar establishment was constituted under the title of the Royal Bank of Scotland, whose advanced capital is now £2,000,000. In 1746, another association was formed, and incorporated by royal charter, with the title of the British Linen Company. The object of this association was at first to encourage the linen manufacture of Scotland, but gradually it fell into the course of common banking business. From £100,000, its capital has increased to £1,000,000. Besides these three banks, there are in Scotland other nine joint-stock banks, with capitals varying from £1,000,000 to £120,000. There are now no private banks. The amount of deposits is above 75 millions, on which interest is allowed. Their authorised issue of notes is £2,749,271, but their actual issue is about double that amount. The Western Bank, with a capital of £1,500,000, a circulation of above £400,000, having 1300 shareholders, and about 100 branches, suspended payments in 1857. The shareholders, however, being under unlimited liability, neither the depositors nor the note-holders sustained any loss. The solvency of the shareholders, as a body, being undoubted, the other banks at once paid off the Western Bank deposits, and redeemed its notes, by which they became its creditors at a remunerating rate of interest. Another Scottish establishment, called the Edinburgh and Glasgow Bank, had about the same time to wind up its affairs, with the entire loss of its capital. Both cases of stoppage arose from a

sily profuse system of discounting bills. In nd and Ireland, the creditors of bankrupt banks generally found great difficulty in recovering a dividend on their deposits and notes; but otland, the loss on such occasions has fallen ly on the shareholders, as in the case of the ·n Bank. In consequence of allowing interest posits, the banks in Scotland may be said to he whole capital of the country, minus only ency passing from hand to hand. This wide l system of depositing is greatly aided by the ishment of branches from the parent-banks; se branches are found in every small town in ngdom. The entire number of branch-banks otland, in 1874, was upwards of 800, having ased by 252 in the course of fourteen

At these branch-banks, the agent (usually pectable person in business) discounts bills certain limits, issues letters of credit, and out notes, and also gives cash on demand for though, strictly, the notes of a bank are only le on demand at the head-office. By a strict n of supervision, Scottish branch-banks are y well conducted, and are of great service in department of trade. For one thing, they powerfully contributed to extinguish burglary ighway robbery, as no one thinks of keeping , except to a trifling amount, either in his or about his person. At all the great fairs, rs attend to receive deposits, and to pay es. Forgeries of Scottish bank-notes are now wn.

banks in Scotland, like the banks in Ireland, nlike the provincial banks in England, are l to issue notes beyond their fixed issues, lding gold equal in amount to the extra issue. e the gold thus retained is, like the other n reserve, liable for all the deposits, as well the whole circulation of a bank, if it should he security of the establishment is increased n a small degree by this arrangement, which, from the loss of profit to the bank on the nemployed, is attended with inconvenience at seasons when the circulation is extended. In nd, and Ireland also, banks can issue one- notes; the English banks are not permitted ulate notes of less value than £5.

ides employing money in discounting bills, Scottish banks grant loans of fluctuating nt, called *cash-accounts* or *cash-credits*. By a ccount is signified a process whereby an lual is entitled to draw out sums as required, ipulated amount, and by an implied condition ke deposits at his convenience towards the ation of the same. On entering into this ement, he finds security to the bank that ll repay to the bank, whenever called on, dance of sums drawn out, less those paid in, he interest that may be due. These accounts lanced yearly like current or deposit accounts. nly difference between the latter and a cash- nt on the face of them is, that if the credit sl on the cash-account is being made use of, alance is in favour of the bank; whereas, on her kind of accounts, the balance is in favour bank's customer.

ks in Ireland. There are nine joint stock , having 382 branches and sub-branches. Their ·ised issue is £6,354,494; the actual issue is a sometimes above, and sometimes below that it. Of the authorised issue, £3,738,428 is that Bank of Ireland. It is a national bank, lend- ,630,769 of its capital to government. It was shed in 1783, with privileges resembling those Bank of England. Its capital is about ,000, and its rest £1,077,000. It allows no interest on deposits. The capitals of the other banks vary from £250,000 to £1,500,000. Five of them are issuing banks. There are also three private banking firms in Dublin.

Foreign and Colonial Banks.—On the continent of Europe, there are both national or incorporated banks and private banks. The national banks are, to a greater or less extent, government establishments, managing the public debt and finances, and, unlike the Bank of England, subject to government influence or interference. In India and the British colonies, there are joint-stock banks and private bankers. The joint-stock banks of Australia are establishments of magnitude. The United States of America are overrun with banks. Insufficient capital, reckless management, and the smallness of the reserve kept, have frequently led to the suspension of payments of these banks. As a means of securing the note-holders, the law in some states requires the banks to deposit with the state government securities against the notes issued. At all times, the number of forgeries of bank-notes in the United States is very considerable, and great caution requires to be exercised in accepting notes as payment.

BANK-NOTES, MANUFACTURE OF. The chief object in the manufacture of B. is to render forgery impossible, or at least easy of detection. This is sought to be effected by peculiarity of paper, design, and printing, or by a combination of these means. See PAPER-MAKING. The main reliance has been on mechanical design the writing, the emblems, and the ornaments being so combined as to render forgery difficult. The ink, too, is peculiar (see INK-MAKING), being the blackest and most indelible of inks. As a further security against forgery, a self-registering machine was contrived by Messrs Oldham. Copperplate printing was the only printing in use for bank-notes till 1837, when a great improvement was made by Messrs Perkins and Heath. This was the reproduction of designs by the mill and die by mechanical pressure. The pattern is engraved on a soft steel plate, which is then hardened, to transfer the pattern by pressure to a soft steel roller, on which, of course, the pattern is produced in relief; the roller or mill is then hardened, to reproduce the pattern in the plate from which the printing is to be done; and thus almost any number of plates for all common purposes can easily be produced.

This system of siderography continued in use for bank-note printing in the Bank of England till 1855, when electrotype printing was introduced by Mr Smee, with the assistance of the mechanical officials (see ELECTROTYPING); and since that time, the notes of the Bank of England have been all produced by surface-printing by the electrotype.

The usual production of notes equals a value of about £24,000,000 per week; it being the policy of the bank to renew the notes before the paper loses that peculiar crispness which distinguishes it from all other paper, and is a safeguard against forgery.

There are seventy or eighty kinds of Bank of England notes, differing in their denominations or values, but similar in the mode of printing. The paper is expressly made for the purpose, by one firm only, and is remarkable for its strength, lightness, and difficulty of imitation. The Bank of Ireland notes are printed on the copperplate plan, not by surface-printing; but the use of delicate mechanism enables this to be done with great accuracy and celerity; the Bank of France notes are produced from plates, the result of photography, electrotyping, and steel-plate printing. Zincography and lithography are employed by some banks; and also *aciérage*, a mode of hardening copper electrotypes with a thin surface of steel.

BA'NKRUPTCY. See INSOLVENCY.

BANKS, in Navigation, are elevations of the bottom of the sea; when tolerably smooth at the top, they constitute *shallows*, *shoals*, and *flats*; but when rocky, they become *reefs*, *ridges*, *keys*, &c. Pilots and captains of ships require to be intimately acquainted with the B. along their route; and a chart, if properly prepared, always defines them by means of small dots, if sands, and small crosses, if rocky. In war-time, small vessels often escape capture by running into shallows where larger vessels dare not follow them. The Newfoundland and the Bahama B. are well-known examples of this kind of sea-bottom.

BANKS LAND, an island in the Arctic Ocean, 70 miles to the south-west of Melville Island. It is intersected by the parallel of 74° N., and by the meridian of 116° W.

BANKS, SAVINGS'. See SAVINGS' BANKS.

BANKS, SIR JOSEPH, a zealous naturalist, was born, according to some accounts, at Revesby Abbey, in Lincolnshire, according to others, in London, in January 1743, and died June 19, 1820. He was descended from a family of Swedish origin, which had been settled in England for about 200 years. To this family belongs also John Banks, who made his name known as a writer of tragedies, in the latter half of the 17th c. B. was educated at Eton and Oxford. In 1763 he made a voyage to Newfoundland and Labrador, collecting plants; and from 1768 to 1771, he sailed with Cook round the world in the capacity of naturalist, and wrote the botanical descriptions for the first voyages. In the year 1772 he visited the Hebrides and Iceland, whence he brought back a rich treasure of specimens for his studies in natural history. Before this voyage, Staffa was hardly known beyond its immediate vicinity. It was carefully examined by B., and through him its wonders were made known to the public. In 1777, he was elected President of the Royal Society, an office which he held for 42 years; and in 1781 he was created a baronet. He deserves particular credit for founding and managing the African Association; and the colony of Botany Bay owed its origin mainly to him. Through his efforts, the bread-fruit tree was transferred from Otaheite to the West Indies, and the mango from Bengal, as well as many of the fruits of Ceylon and Persia. Many naturalists and travellers—Blumenthal, Hornemann, Burckhardt, Mungo Park, and others, were indebted to him for zealous and disinterested assistance in their labours. During the French war, B. did much to alleviate the sufferings of all captive men of science, and used his influence with government to procure the restoration of their papers. Cuvier, in his *éloge* on him before the French Academy of Science, states that no less than ten times had collections, captured by the English, been restored to the Jardin du Roi at Paris through the instrumentality of B. No man of science appealed to him in vain for pecuniary assistance; and his splendid library of natural history was at the service of those who desired to consult it. With the exception of articles in magazines, and contributions to the publications of learned societies, especially to the *Philosophical Transactions*, B. has written nothing but two small works—*A Short Account of the Causes of the Diseases in Corn called Blight, Mildew, and Rust*, which was printed for his friends in 1803, and for the public in 1805; and *Circumstances Relative to Merino Sheep* (London, 1809). He left a valuable library, of which an excellent catalogue was made by his friend Dryander; and a rich collection of specimens in natural history, both of which he bequeathed to the British Museum.

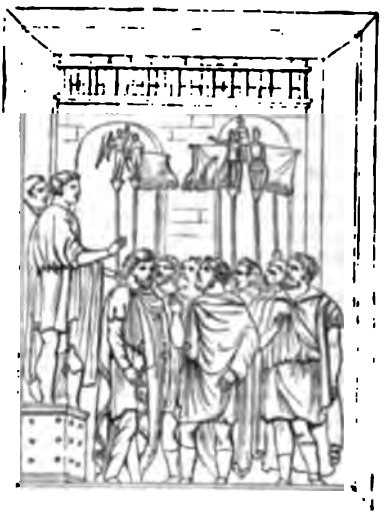
NN, the name of two rivers in the north-east
land; the one, the Upper B., flowing into, and
ner, the Lower B., out of Loch Neagh. The
B. rises on the north side of the Mourne
ains, in the south of Downshire, and runs
es north-north-west through the counties of
and Armagh, successively in a granite, silurian,
and tertiary basin, into the south side of
Neagh. It passes Banbridge, Gilford, and
own. At the latter place the Newry Canal
. The Lower B., strictly the continuation of
pper, issues from the north-west corner of
Neagh, and flows 40 miles north-north-west,
h Lough Beg, and dividing the counties
trim and Londonderry. It runs past Port-
e and Coleraine, into the Atlantic Ocean 4
south-west of Portrush. One mile above
it falls over a ledge of rock 13 feet high.
surplus waters of Lough Neagh to the
... has important salmon and eel-fisheries.
f 200 tons can reach Coleraine by the river,
from the ocean.

ATYNE CLUB, a literary club deriving
e from George Bannatyne, to whose industry
indebted for the preservation of much of the
h poetry of the 15th and 16th centuries. The
as instituted in Edinburgh in 1823 by Sir
Scott, with the assistance chiefly of Mr David
of the Signet Library, Mr Archibald Con-
and Mr Thomas Thomson. The object of the
ion was to print rare works illustrative of
h history, topography, poetry, miscellaneous
re, &c., in a uniform and handsome manner,
t the expense of the club, or as the contribu-
individual members. As a general rule, the
of copies of each work printed was limited
number required for distribution among
rs, but in some instances a few were printed
. The club originally consisted of 31 mem-
ly, who paid an annual contribution of five
; but, owing to the anxiety of many eminent
become members, the number was gradually
ed to 100, where it was definitively fixed, the
annual payment being still required. Its
resident was Sir Walter Scott, who was
ed by Mr Thomas Thomson, and Lords Cock-
nd Rutherfurd; and its first secretary was
rid Laing, who continued to its close to dis-
the duties of the office. The club had annual
gs in December, which were of a very con-
character, so far as can be judged from an
t of their first meeting published in the *Edin-
literary Gazette* of February 1824—afterwards
ed by the club itself—which suggestively
nat the *Bannatyne Garland*, No. 1, a song
ed by one of the members, was sung 'to the
Four Bottles more.' These meetings, how-
ere given up, and the club itself, which, in
umbered about eighty members, was finally
ed on 27th February 1861. Since its com-
ent it numbered among its members many
most distinguished Scotsmen, and printed 116
some valuable as they are rare, and all bring-
h prices at sales.

NER, a piece of cloth attached to a pole,
ually bearing some warlike or heraldic device,
onal emblem. In this sense B. is a generic
ncluding many species, such as standard,
pennon, flag, &c. Banners have been used
e earliest times, and in all countries, for the
of directing the movements of troops. We
them constantly in the Old Testament, as in Numbers ii. 2, 'Every man of the children of Israel shall camp by his standard, and under the ensign of his father's house.' The earliest Roman standard was a bundle of straw fixed to the top of a spear. This was succeeded by figures of animals —the horse, the boar, &c., all of which soon gave place to the eagle, which continued all along to be the chief Roman ensign, and was afterwards assumed by the German, and latterly by the French emperors of the Napoleon dynasty. In addition to the eagle, each Roman cohort had a B., generally a serpent or dragon woven on a square piece of cloth. The standard of the cavalry was a square piece of cloth expanded on a cross, and it was to this that the term *vexillum* properly applied. Examples of these standards are sculptured on the Arch of Constantine at



Roman Standards from the Arch of Constantine.

Rome. The top of the staff was also frequently adorned with a figure of Mars or of Victory, and in later times, with the head of the reigning emperor. After Constantine embraced Christianity, the Cross was substituted for the head of the emperor on the purple B. of Byzantium. Standards were less in use amongst the Greeks than has been usual with warlike nations; but a standard, and sometimes a scarlet flag, was employed as a signal for giving battle. On the rise of Chivalry, in the middle ages, the ordering of banners, like every other branch of military organisation, attained to something like scientific exactitude. From the B.-royal, which bore the national emblems, to the small streamer attached to the lance, with its cross or stripes, there was a regular subordination, each emblem having its place and its meaning. The pennon of the simple knight differed from the square B. of the banneret (q. v.), in being pointed at the ends. In addition to their varieties in size, shape, and colour, these banners were distinguished by the emblems which they bore. One of the earliest is the Danish raven, depicted on the standard taken by Alfred, of which Asser mentions the tradition, that 'in every battle, wherever that flag went before them, if they [the Danes] were to gain the victory, a live crow would appear flying on the middle of the flag; but if they were doomed to be defeated, it would hang down motionless.' Nor did the privilege of carrying banners belong to princes and knights alone, bishops and abbots displayed similar ensigns, which were carried before them in religious processions,

and under which their retainers fought in their defence. It was to these that the term 'Gonfalon,' a word as to the origin of which much diversity of opinion exists, was more commonly applied. In place of the heraldic emblems of the knight, the B. of the Church, and of towns and communes, usually bore the effigies of saints. Some banners, however, displayed no ensigns whatever, and were known simply by their colour. Of this the *oriflamme*, or plain ruddy flag of St Denis, was a famous example. The celebrated Bayeux Tapestry (q. v.) throws considerable light on banners, as well as on other matters connected with the warlike arrangements of the middle ages. Much curious information on this and kindred subjects will be found in Hewitt's *Ancient Armour and Weapons in Europe*. By every warlike people the B. has been regarded as the emblem of national honour, as a palladium for the defence of which the individual warrior was at all times ready to sacrifice his life. From the converse of this feeling, banners and flags taken from the enemy have always been regarded as special trophies of victory, and places of honour in churches and public buildings have consequently been assigned them. As to the flags borne by the ships of different nations, and the arrangements concerning them in peace and war, see FLAG; as to colours of regiments, see COLOURS.

The relation which banners bear to other kinds of flags, in their forms and uses will be explained under COLOURS, MILITARY; ENSIGN; FLAG; PENDANT; &c.

Banner displayed, is the term used by heralds to describe a B. open and flying.

BA'NNERET, a higher grade of knighthood conferred by the sovereign for some heroic act performed in the field, and so called because the pennon of the knight was then exchanged for the banner—a proceeding which was effected by the very simple means of rending the points from the pennon. The first B. in England is said by Froissart to have been made by King Edward I., and the last time the honour was conferred was by Charles I. after the battle of Edgehill, the recipient being an individual who rejoiced in the familiar name of John Smith. The ceremony of the creation of a Knight-B. must have been very impressive to persons filled with the ideas which were prevalent in the ages of chivalry. The king, or his general, at the head of his army, drawn up in order of battle after a victory, under the royal standard displayed, attended by all the officers and nobility of the court, received the B. elect, who was not necessarily a knight previously, led between two knights of note, or other men famous in arms, carrying his pennon in his hand, the heralds walking before him and proclaiming his valiant achievements, for which he deserved to be made a Knight-B., and to display his banner in the field. The king, or general, then said to him: 'Advance, Banneret!' (*Advances toy Banneret*), and caused the point of his pennon to be torn off. The new knight, with the trumpeters sounding before him, and the nobility and officers bearing him company, was sent back to his tent, where a noble entertainment was provided by the king. Some attempts have been made to revive the title in recent times, as when George III., at a review of the navy at Portsmouth in 1773, conferred it on Admiral Pye and several other officers.

BA'NNOCK, a cake of home-made bread, common in the country parts of Scotland, but now less so than formerly. It is usually composed of pease-meal or of pease and barley meal mixed; prepared without any leaven, it is baked on a circular plate of iron, called a girdle. When made of mixed meal, it is called a mashlum bannock. 'Bannocks of barley-meal' form the theme of a popular Scottish song. A superior kind of B., called a Selkirk B., from the place where it is made, resembles the finer and lighter species of tea-cakes prepared by bakers. The word B. is from the Gaelic *bonach*, a cake. In the west of Scotland, it is pronounced *bunnock*. There is an amusing fairy-tale called *The Story of the Wee* (little) *Bunnock*. The B. is doubtless of great antiquity, being, in fact, the primitive cake, only varied in material, of every country.

BA'NNOCKBURN, a village in the east of Stirlingshire, three miles south-south-east of Stirling, on the Bannock rivulet, which falls, a few miles below this, into the Forth. Near this was fought the great battle of B. on Monday, 24th June 1314. Robert Bruce, with 30,000 Scotch, gained a signal victory over Edward II., with 100,000 English, and secured his throne and the independence of Scotland. The English are said to have lost 30,000, and the Scotch 8000 men. The 'Bore Stone,' on which Bruce is said to have fixed his standard on that eventful day, is still to be seen on an eminence near the scene of the fight. On the south-east of the field of B., at Sauchie Burn, James III. was defeated in 1488 by his rebellious subjects, and assassinated after the battle in a mill where he had taken refuge. B. is now an important seat of the woollen manufactures, especially those of tartans and carpets. It has long supplied the tartan worn by the Highland regiments. Tanning is carried on to some extent, and the neighbouring villages are noted for the manufacture of nails. Coal abounds in the vicinity. Pop. (1871) 2258.

BANNS, or BANS, in the law of England, means a proclamation, or public notification, or summons, in which general sense, however, it may be said to have become obsolete. It is now chiefly, if not solely, used in the publication of intended marriages, as to which, see next article.

BANNS or BANS OF MA'RRIAGE. This is one of three alternative preliminary forms now essential to the legal celebration of marriage in England. The other two are marriage by licence, and marriage by a registrar's certificate. B. of M., like many of our ecclesiastical regulations, has its origin in the ancient practice of the Roman Catholic Church, which our reformers wisely refrained from abolishing. By the publication of these B. is meant the legal proclamation or notification within the parish, district, or chapelry, and in the proper church or chapel, of the names and descriptions of the persons who intend to be there married; the object being the notoriety of the solemn act, so that all who have objections to the marriage may be enabled to state them in time. According to the old English canon law, the publication of B. might be made on *holidays*; but a change was made to *Sundays* by the first important Marriage Act, the 26 Geo. II. c. 33; and although that act was afterwards superseded by the 4 Geo. IV. c. 76, the regulation as to Sundays has been since continued. Seven days' notice at least must be given to the clergyman before publication of bans. The other acts in force are the 6 and 7 Will. IV. c. 85, the 1 Vic. c. 22, the 3 and 4 Vic. c. 72, and the 19 and 20 Vic. c. 119. The law, as contained in these acts of parliament, is as follows: By the 4 Geo. IV. c. 76, s. 2, it is enacted that all B. of matrimony shall be published in an audible manner, according to the rubric prefixed to the marriage-service in the *Book of Common Prayer*, upon three Sundays preceding the ceremony, during the time of morning-service, or of evening-service (if on the day of publication there shall be no morning-service) immediately after

cond lesson. The rubric referred to is in llowing terms: 'I publish the banns of ge between M. of - - - and N. of . If you know cause or just impediment why ersons should not be joined together in holy ony, ye are to declare it. This is the first l, or third] time of asking.' By the 22d of the same act, all marriages celebrated t such publication of B., or without licence e, under the 6 and 7 Will. IV. c. 85, s. 42, t a Registrar's certificate), are declared to be ıll void. By the 26th section of the last-med act, the bishop, with consent of the and incumbent, may license chapels for the ation of marriages in populous places; and by d section of the 1 Vic. c. 22, B. may be publ in such chapels. By section 9 of the 4 V. c. 76, it is provided, that if the marriage celebrated within three months after publ n of B., the marriage shall not take place the B. shall have been republished on three Sundays, unless it be a marriage by licence, by certificate, which two latter alternatives, er, must also be availed of within the three s. It only remains to be added on the law, ained in these marriage acts, that by section ne last of them, the 19 and 20 Vic. c. 119, it ided, that in every case in which one of the intending marriage without licence shall in Scotland, a certificate of proclamation of cotland, under the hands of the session-clerk parish in which such proclamation shall have nade, shall, when produced to any person uthorised under the provisions of this act emnise a marriage, be as valid and effectual thorising such person to solemnise such ge as the production of a certificate for ge of a superintendent registrar of a district gland would be in reference to a party t within such district.

purpose of the law is to secure public knowf intended marriages, and therefore, although Geo. IV., following in this respect the 26 H., declares that marriages shall be void t publication of B. (where, of course, that chosen preliminarily, it is not necessary that ublication should be made in the real baptismal of both or either of the parties; it is sufficient he B. be published in the names by which rties are *known*, or either of them. Nay, it ppears that where the baptismal names have discovered, having been previously concealed nown, it is better, if not necessary, that publ should be made in the names by which the are familiarly known in the district, by indeed, they may be said to be known to rld. There are numerous cases decided in nd from which such doctrine necessarily fol-

As the publication of banns invites people ect, if the parent or guardian express dissent, e duty of the clergyman, when such objections ered, to proceed no further; and if he, notanding, marry the parties, he will be liable re penalties by the ecclesiastical law, though ll not be liable to an indictment. Again, on her hand, if he refuse, without cause, to perhe marriage, he is liable to an action. It has en decided, that a fraudulent knowledge of a name in the publication of B. will not void arriage, unless the fraud should be on *both*

Scotland, B. have the same Roman Catholic as in England. Indeed, Mr I . . of est authoritative Scotch legal w a opinion, that the Scotch borrows the decrees of the *Council of*

recent able writer (see *Fraser's Domestic Relations*, vol. i. p. 113) considers this opinion erroneous, and shews that B. were first sanctioned in Scotland by councils which were held in that country long before the time of the Council of Trent. After the Reformation in Scotland, the practice of proclaiming B., as the phrase is in that country, was continued. They are described in the Scotch Act 1661, c. 31, 'as a part of the laudable order and constitution of the kirk;' and they have since been mentioned in various acts of parliament applicable to Scotland, such as the 10 Anne, c. 7, and the 4 and 5 Will. IV. c. 28. By the first of these acts, the privilege of publicly celebrating marriage was extended to the Scotch *Episcopalian* clergy, but with a proviso that the B. should be duly published three Lord's Days, not only in the Episcopal churches which the parties frequent, but also in the parish church or churches. Should the parish minister, however, neglect or refuse to publish the B. of such parties, the act declares that it shall be sufficient to do so in any Episcopal congregation alone. The 4 Will. IV. c. 28, puts other dissenting bodies in Scotland in the same position as the Episcopal Church there; but there is this little difference, that publication of the B. of such dissenters is required to be made in the *parish* church alone. There is one other regulation of the Scotch law on this subject which is deserving of notice for popular information namely, that when both of the parties have their *domicile* (q. v.) within Scotland, and enter into marriage in England or Ireland, they must have their B. proclaimed in the parish church of their domicile in Scotland, otherwise they are liable to the penalties of clandestine marriage. Such is the express enactment of the Scotch statute 1661, c. 31.

The Scotch law differs from the English in regard to the effect of non-publication of banns. In England, in some cases, the consequence is to render the marriage absolutely void. In Scotland, however, marriage, without proclamation of B., is valid; but in such case the parties, celebrator, and witnesses are liable in the above penalties. See MARRIAGE, SPECIAL LICENCE, REGISTRATION OF BIRTHS, DEATHS, AND MARRIAGES.

BANQUETTE, in Fortification, is a raised ledge or step beside the parapet of a rampart, of such a height that musketeers, when standing on it, may be able to fire over the crest of the parapet without too much exposure to the enemy. It is about 4 feet wide, and 4 or 4½ feet below the crest. The musketeers ascend to it from the rampart either by a few steps or by a sloping path.

BANTAM, a seaport, now decayed, in a district of the same name, which forms the west end of Java. It is 40 miles to the west of Batavia, lies in lat. 6° 2′ S., and long. 106° 11′ E. It was founded by the Dutch in 1602, being their earliest establishment in the island. The district contains 362,242 inhabitants.

BANTAM FOWL, a well-known variety of the common Domestic Fowl (q. v.), originally brought from the East Indies, and supposed to derive its name from Bantam, in Java. It is remarkable for small size, being only about a pound in weight, and for a disposition more courageous and pugnacious than even that of a game-cock. A bantam cock will drive to a respectful distance great dunghill cocks five times its weight, and has been described as 'a beautiful example of a great soul in a little body.' There are several subvarieties of the bantam. Most of them have the legs much feathered. The flesh and eggs are good, although the eggs are of course small; and the bantam lays well in winter.

BANTENG (*Bos Banteng* or *B. Sondaicus*), a species of Ox (q. v.), a native of Java and Borneo, which, in colour, shape, horns, and want of dewlap bears some resemblance to the Gaur (q. v.) of India, 'but in the skeleton of the gaur, the sacrum consists of 5 vertebræ, and the tail of 19, while in the skeleton of the B., the sacrum consists of but 4 vertebræ, and the tail of 18.' The B. is black, with white legs. The hair is short and sleek, the limbs slender. The muzzle is sharp. The back rises into a high arch immediately behind the neck. The B. inhabits forests, and has been generally described as untamable, but this opinion rests on no satisfactory authority.

BA'NTRY, a seaport town in the south-west of Cork county, Ireland, in a cove opposite Whiddy Isle, at the head of B. Bay, and 44 miles west-south-west of Cork. The two chief streets converge into an open space towards the sea, and mountains, 933 feet high, rise behind the town. The chief trade is the export of agricultural produce. A little fishing is carried on. In last century, there was an extensive pilchard-fishery here; but the pilchard has now deserted the coast. Many tourists resort to B. in summer. Pop. between 2000 and 3000.

BA'NTRY BAY, a deep inlet in the south-west extremity of Ireland, between Crow Point and Sheep's Head Point, in Cork county. It is 25 miles long, running east-north-east, with a breadth of 3 to 5 miles. It is one of the finest harbours in Europe, affording safe and commodious anchorage for ships of all sizes. Near the entrance on the north side is a fine large sheltered harbour, formed by Bear Island, with a safe passage on both sides. At the head of the bay are two harbours: the one to the south, or the landlocked roadstead of B. harbour, is formed by Whiddy Isle, opposite B. town; the other to the north, or Glengariff harbour, is also sheltered by an island, but is small, and narrow at the entrance. The coast around B. B. is rocky and high, consisting of Devonian strata, and exhibiting some of the finest scenery in the kingdom. On the north side, 17 miles west of B. town, is the great cataract of Hungry Hill, where three lakes, at the heights of 1011, 1126, and 1360 feet above the sea, discharge their waters, by almost continuous cascades, into Adrigoole Creek. Near the opening of B. B. a skirmish took place, in 1689, between a small English fleet under Admiral Herbert (afterwards Lord Torrington), and the French fleet, which conveyed James II. to Kinsale. Several ships of the French invading expedition under General Hoche anchored here in 1796.

BANX'RING (*Tupaia*), a genus of insectivorous quadrupeds, remarkably differing from the other *insectivora* (q. v.) in their habits, as they climb trees with the agility of lemurs or squirrels. They are also remarkable for their very elongated muzzle. They have soft glistening fur, and a long bushy tail. The few species known are all natives of the Indian archipelago.

BA'NYA (NEGAY), or **NEU'STADT**, a town of Hungary, province Szathmar, with a royal mint, and productive mines of gold and silver. Pop. 9082.

BA'NYAN, or **BA'NIAN** (*Ficus Indica*), a tree, native of India, remarkable for its vast rooting branches. It is a species of FIG (q. v.); has ovate, heart-shaped, entire leaves, about five or six inches long; and produces a fruit of a rich scarlet colour, not larger than a cherry, growing in pairs from the axils of the leaves. The branches send shoots downwards, which, when they have rooted, become stems, the tree in this manner spreading over a great surface, and enduring for many ages. One has been described as having no fewer than 350 stems, equal to large oaks, and more than 3000 smaller ones, covering a space sufficient to contain 7000 persons. The branches are usually covered with monkeys, birds, and enormous bats. The monkeys eat both

Banyan-Tree.

the fruit and leaves. The vegetation of the B. seldom begins on the ground. The seeds are deposited by birds in the crowns of palms, and send down roots which embrace and eventually kill the palm. As the B. gets old, it breaks up into separate masses, the original trunk decaying, and the props becoming separate trunks of the different portions. The wood of the B. is light, porous, and of no value. The bark is regarded by the Hindoo physicians as a powerful tonic, and is administered in diabetes. The white glutinous juice is used to relieve toothache, and also as an application to the soles of the feet when inflamed. Bird-lime is also made from it. Gum-lac is obtained in abundance from the B.-tree. The B.-tree is beautifully described by Southey in his poem *The Curse of Kehama*.

BANYULS-SUR-MER, a town of France in the Pyrénées Orientales, with a fishing-port on the Mediterranean. The celebrated wines of Grenache and Rancio are produced in this district. Near the town are four old towers, one of which marks the division between France and Spain. B. was the immediate scene of many encounters between the French republicans and the Spaniards during the first French Revolution. Pop. (1872) 2227.

BANYUWA'NGY, or **BANJOUVANGY**, an important and populous seaport town and military post belonging to the Dutch, on the east coast of Java, capital of district of same name.

BA'OBAB. See ADANSONIA.

BAPAUME, a fortified town of France, [illegible] ment of Pas-de-Calais. A portion of the [illegible] troops advanced to this place after [illegible] French to abandon their fortified [illegible] retreat behind the Scarpe, in August 1

BA'PHOMET is the name [illegible] symbol, which was in use amo[illegible] the [illegible] According to the oldest and mo[illegible] pretation, the word is a corrupti[illegible] to whose faith the members [illegible] accused of having a leaning. wisdom. He charges the knights with a depraved Gnosticism, and makes the word signify the baptism of wisdom—the baptism of fire; in short, the Gnostic baptism—a species of spiritual illumination, which, however, was interpreted sensually by later Gnostics, such as the Ophites (an Egyptian sect of the 11th c.), to whose licentious practices he declares them to have been addicted. But this explanation is generally discredited.

BA'PTISM (Gr. *bapto*, to dip or wash, or to stain with a liquid), one of the sacraments (q. v.) of the Christian Church, deriving its name from the outward rite of washing with water, which forms an essential part of it. B. is almost universally acknowledged among Christians as a sacrament, and is referred to the authority of Christ himself, whose express commandment is recorded in the gospels (Mat. xxviii. 19; Mark xvi. 16). B. is frequently mentioned in the New Testament as a divine ordinance.

The name and the rite were not, however, altogether new when the ordinance was instituted by Christ. Religious meanings were early attached to washings with water, both by heathens and Jews; they were among the ordinances of the Jewish law; and it is not necessary to go beyond that law to find the origin of the custom of washing or *baptising* proselytes upon their admission into the Jewish Church. Washing with water was requisite for the removal of ceremonial uncleanness, and every proselyte must have been regarded as, prior to his admission into the Jewish Church, ceremonially unclean. John the Baptist baptised not proselytes upon their renouncing heathenism and entering the Jewish Church, but those who, by birth and descent, were members of it, to indicate the necessity of a purification of the soul from sin—a spiritual, and not a mere outward change.

One of the most important of the controversies which have agitated the Christian Church as to B., is that concerning the proper subjects of B., whether adults only who profess faith in Christ are to be baptised, or if this ordinance is to be administered to their infants also. See BAPTISTS, and BAPTISM, INFANT. The B. of adults was certainly more frequent in the apostolic age than it has ordinarily been where the B. of infants has prevailed; for which an obvious cause presents itself in the fact, that the first members of churches were converts from Judaism or from heathenism. It is, however, generally held by those who advocate the B. of infants, that it was the practice of the apostles and of the church of the apostolic age to baptise the infants of Christians; which, on the other hand, is as stoutly denied, and infant B. is alleged to have crept in along with other corruptions. For neither opinion can any positive historical proof be adduced, the arguments on both sides being purely inferential.

It is admitted, on all hands, that at an early period in the history of the church, B. was administered to infants, although, according to Neander, even after 'it had been set forth as an apostolic institution, its introduction into the general practice of the church was but slow.' He finds 'the first trace' of it in Irenæus. It was opposed by Tertullian about the end of the 2d c.; and was advocated by Cyprian, and acknowledged as an apostolic institution in the North African Church and in the Alexandrian and Syro-Persian Churches in the 3d c.; but it was not until the 5th c. that it became fully established as the general practice of the Christian Church. It has unquestionably continued to be the general practice from that period to the present day; feebly opposed by some of the sects of the middle ages, and more vigorously by some of those who have adopted the general principles of the Reformation. See BAPTISTS.

Both the practice of infant B., and the neglect of it in the early ages of the church, were connected with particular views of religious doctrine, and of the nature and purpose of B. itself. The prevalence of the Augustinian doctrine of original sin is generally regarded as a principal cause of the prevalence of infant B.; but Pelagius, whilst opposing that doctrine, maintained the necessity of infant B., apparently upon the ground that the kingdom of heaven can be attained by human beings only through God's grace. No little influence in favour of infant B. must be ascribed to the growing belief of the absolute necessity of B. to salvation, and of a sort of mysterious efficacy in the rite itself. It is certain, on the other hand, that the belief in the forgiveness of sins in B. led to a practice of deferring it as long as possible, that all sins might be blotted out at once; thus the Emperor Constantine the Great was baptised only a short time before his death. The approach of a war or pestilence caused many to rush forward in haste to be baptised, who had previously delayed.

Two modes of B. are practised: by immersion or dipping, and by aspersion or sprinkling, concerning which there has been much controversy in the early period of the church's history, as well as in recent times. Affusion, or pouring, the common practice of the Church of Rome, may be regarded as essentially the same with sprinkling. The advocates of sprinkling universally admit the validity of B. administered in the other mode, but the advocates of dipping generally refuse to acknowledge that B. by sprinkling can be true Christian baptism. The opponents of infant B., almost without exception, insist upon immersion; whilst aspersion or affusion of water is general, except in the Eastern churches, wherever the B. of infants prevails. The argument upon which Baptists depend most of all is from the word B., and the verb *baptizo*, to baptise, which also, in classic Greek, signifies to immerse. On the other side, it is contended that a strict limitation to this sense does not well accord with its character as a 'frequentative' form of *bapto;* and instances are adduced from the New Testament itself, in which this signification cannot easily be attached either to the noun or to the verb, as 1 Cor. x. 2, where Paul says that the Israelites were 'baptised unto Moses in the cloud and in the sea;' and Heb. ix. 10, Mark vii. 4, and Luke xi. 38, where both verb and noun are employed concerning the *washings* of the Jews, and the noun even of their washing of 'cups, and pots, brazen vessels, and of tables.'—To the argument in favour of immersion, derived from the phrases employed when B. is mentioned in Scripture, as when we are told (Mat. iii. 6) that John the Baptist baptised 'in Jordan,' that our Lord after his B. (Mat. iii. 16) 'went up out of the water,' that Philip and the Ethiopian eunuch (Acts viii. 38) 'went down both into the water;' it is replied that all the passages of this description, even if their meaning were certainly as precise and full as Baptists suppose it to be, are insufficient to sustain the weight of the conclusion as to the necessity of a particular mode of B.; that, however, it is far from being clear that these passages must be interpreted or the meaning of the Greek prepositions so strictly defined as the argument requires; and further, that there are instances mentioned in Scripture which afford a presumptive argument in favour of another mode of B., as where we are told of great numbers added to the church in one day; whilst we have nowhere any

intimation of converts being led to any pond or river to be baptised. To the argument drawn from the language of Paul in Rom. vi. 4, Col. ii. 12 (see BAPTISTS), it is replied that it depends upon a fanciful interpretation of these texts.—According to most of the advocates of B. by sprinkling, the great error of their opponents is that of attaching too much importance to the question of the mode of baptism.

It is, however, indisputable that in the primitive church the ordinary mode of B. was by immersion, in order to which *Baptisteries* (q.v.) began to be erected in the 3d, perhaps in the 2d c., and the sexes were usually baptised apart. But B. was administered to sick persons by sprinkling; although doubts as to the complete efficacy of this *clinic* (sick) B. were evidently prevalent in the time of Cyprian (middle of 3d c.). B. by sprinkling gradually became more prevalent; but the dispute concerning the mode of B. became one of the irreconcilable differences between the Eastern and Western Churches, the former generally adhering to the practice of immersion, whilst the latter adopted mere pouring of water on the head, or sprinkling on the face, which practice has generally prevailed since the 13th c.; but not universally, for it was the ordinary practice in England before the Reformation to immerse infants, and the *fonts* (q. v.) in the churches were made large enough for this purpose. This continued also to be the practice till the reign of Elizabeth; and the change which then took place is ascribed to the English divines who had sought refuge in Geneva, and other places of the continent, during the reign of Mary. To this day the rubric of the Church of England requires, that if the godfathers and godmothers 'shall certify him that the child may well endure it,' the officiating priest 'shall dip it in the water discreetly and warily;' and it is only 'if they shall certify that the child is weak,' that 'it shall suffice to pour water upon it,' which, however, or sprinkling, is now the ordinary practice.

B. was accompanied, from an early period in the history of the church, with various forms and ceremonies, besides the simple rite of washing with water and the pronouncing of the formula which declares it to be 'in the name of the Father, and of the Son, and of the Holy Ghost.' These ceremonies are almost all retained in the Church of Rome, and also generally in the oriental churches, but have been entirely or almost entirely laid aside by Protestants. The Church of England retains the sign of the cross made upon the forehead after B., but the other Protestant churches in Britain reject it. It was an ancient custom that the *catechumens*, as candidates for B. were called whilst receiving instruction with a view to that sacrament, when they were to be baptised, publicly made a profession of their faith and a renunciation of the devil and all his works. The profession of faith is still retained by Protestant churches as the formal ground of the administration of B.; the renunciation of the devil and his works is required by the Church of England of the person baptised, if an adult, or of the *sponsors* or 'sureties' of a child. Sponsors (q.v.) were early admitted to answer for those who could not answer for themselves, and particularly for infants. The belief in the absolute necessity of B. to salvation led even to B. of the dead among the Montanists in Africa, in which sponsorship was also introduced. Presbyterian and Independent churches generally reject all sponsorship, and regard the profession made by parents as simply a profession of their own faith, which entitles their infants to baptism. The ancient practice of exorcism (q. v.) immediately before B. has been rejected as superstitious by almost all Protestant churches; as have also that of immersing three times (*trine immersion*), or sprinkling three times, with reference to the three persons of the Godhead—that of breathing upon the baptised person, 'to signify the expulsion of the devil,' and to symbolise the gift of the Holy Spirit—that of anointing with oil (*chrism*, q.v.), to symbolise the same gift, or to indicate that the baptised person is ready, as a wrestler in the ancient games, to fight the good fight of faith—that of giving him milk and honey, in token of his spiritual youth, and of his reception of spiritual gifts and graces—that of putting a little salt into his mouth, to signify the wisdom and taste for heavenly things proper to a Christian—that of touching his nostrils and ears with spittle, to signify that his ears are to be ever open to truth, and that he should ever feel the sweet odour of truth and virtue—and that of clothing him after B. with a white robe (*the chrysome*), in token of the innocence of soul which by B. he was supposed to have acquired. The white robe and the anointing with oil were retained in the Church of England for a short time after the Reformation.—The giving of a name in B. (see the article NAMES) is no essential part of it, but is a custom apparently derived from that of the Jews in circumcision (Luke i. 59—63).—The Church of Rome prefers the use of holy-water (q.v.) in B., but regards any water as fit for the purpose in case of necessity.—According to an ancient usage, long obsolete, the ordinary administration of B. was limited to the two great festivals of Easter and Whitsuntide.—Whether B. may be administered in private, has been much debated, both in ancient and modern times. The administration of B. in private houses, and not in the presence of a congregation, was one of the things earnestly contended against by the Presbyterians in Scotland in the first half of the 17th c.; their opposition being grounded, not only upon hostility to what they deemed usurpation of authority, but upon the danger of superstitious views of baptism. And apparently upon this latter ground, B. in private houses is also discouraged, even while it is allowed, if there is 'great cause and necessity,' by the Church of England; yet it has become very frequent both in the Church of England and among the Presbyterians of Scotland.

Some of the most important questions concerning B. will be most appropriately noticed in the article SACRAMENT, particularly those relating to its place in the Christian system and among the means of grace. The opinions early became prevalent, that forgiveness of sins is obtained in B., and spiritual life begun, and that it is indispensably necessary to salvation—exception being only made, if any was made at all, of the case of believers, adult persons, who desiring B., were prevented from being baptised, and particularly of those who suffered martyrdom, which was generally held to be equivalent to baptism. The Church of Rome still owns, as supplying the place of B. by water, these two—B. by desire, and B. by blood—i. e., in martyrdom.—According to the general doctrine of the Protestant churches, B. is 'a sign and seal' of the covenant of grace, representing as a sign the blessings of the covenant, and as a seal, confirming the covenant. As a sign, it is generally held to represent in its rite of washing, the removal both of guilt and corruption, by the blood and by the Spirit of Christ, and as to relate equally to pardon and regeneration, although some have limited its symbolic reference to regeneration alone. One of the most important points disputed concerning B., is that of baptismal regeneration. See REGENERATION.

Some early Christian sects appear to have rejected B., on grounds somewhat similar to those on which it is rejected by Quakers (q.v.) at the present day,

in the passages which relate to it symboli-
insist that a spiritual B. is the only real
ristians.—The Socinians also in modern
e maintained that B. is not an ordinance
ent obligation, but a merely symbolical
le importance.
ntroversy has taken place concerning *Lay*
Wherever there is a recognised ministry in
, there is a general agreement in referring
ry administration of B. to those who hold
. It might be expected that the more
he necessity of the transmission of *holy*
apostolical succession is asserted, the more
lso would exclusiveness be manifested with
he right of the *clergy* to administer B. But
ncy is counteracted by the belief in the
f B., or at least of its great importance to
ion of infants; so that from an early period
allowed, although not without a struggle,
apprehended danger; and in the Church
this principle is logically carried out to
extent, and even women are authorised
ster B. in cases of necessity. On the
nd, lay B. was at first permitted in the
Church of England; but the prevalence
iews led to a kind of formal restriction of
of administering it to 'lawful ministers,'
in practice the validity of lay B. is still
recognised.
question much agitated in the church
times, is that concerning the validity of
retics. The opinion ultimately prevailed,
y heretics is valid, except in the case of
do not baptise in the name of the three
the Godhead. This continues to be the
iversal opinion. Few Protestant theolo-
itate to acknowledge the validity of B.

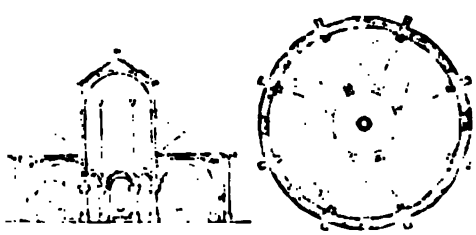
blessings which children are capable of.
tended that the arguments in favour of
lvation derive additional strength from
r of the place of infants in the church
according to which they are entitled to baptism. The passages which connect B. with faith are regarded as exclusively relating to adults, like the passages which connect salvation with faith and repentance. In reply to the argument that there is no express command for infant B., it is argued that the state of the case rather demands of those who oppose it the production of an express command against it, without which the general command must be held to include it; the words and actions of our Saviour (Mark x. 14) with respect to children are quoted as confirming the opinion that the place of infants in the church is precisely what it was under the Jewish dispensation; and it is contended that it would have been a very great restriction of privilege in the new dispensation if infants had been excluded from a place which they held before, as entitled to a seal of the covenant, whereas it is evident that the new dispensation is characterised not by restriction but by enlargement of privilege.—Those who hold the doctrine of infant B. are styled Paedo-baptists.

The Roman Catholic and Lutheran Churches regard the B. of infants as admitting them into the church, and making them members of Christ's body. The Reformed (q. v.) Churches hold that the children of Christians are included in the visible church from their birth, and therefore entitled to baptism. These are the natural starting-points of very different systems.

BAPTISTERY (Gr. *baptisterion*, a large vase or basin), the name given sometimes to a separate building, sometimes to the portion of the church itself in which the ceremony of baptism was performed. In the latter case, the B. was merely the enclosure containing the font, to be seen in most English churches. According to the earlier arrangements of the Christian Church, however, the B. seems usually to have been a building standing



Section and Plan of Baptistery at Asti.

detached from, though in the immediate vicinity of the church to which it appertained. Baptisteries, at first, were either hexagonal or octagonal, but afterwards became polygonal, and even circular. The B. of St Giovanni in Fonte, at Rome, commonly known as the B. of Constantine, is octagonal, whilst the church of St Constantia, which was originally a B., is circular.

The celebrated B. of Florence is an octagonal structure, measuring about one hundred feet in diameter. It stands detached from, but in the immediate vicinity of the cathedral. It is built of black and white marble, in the style which Giotto is said to have introduced, and which is still peculiar to Florence. Internally, a gallery, which runs nearly round the whole building, is supported by sixteen large granite columns, and the vaulted roof is decorated with mosaics by Andrea Tafi, the pupil of Cimabue. But the magnificent bronze doors, with their beautiful bas-reliefs, are the most remarkable feature of the baptistery. The most celebrated of these was executed by Lorenzo Ghil

the work of Andrea of Pisa. Fifty years were required for their completion; and it is remarkable that the contracts for their execution are still preserved. Next in importance, and of even greater size, is the B. of Pisa. It is circular in form, the diameter measuring 116 feet. Externally, it is divided into three stories, the two under ones being surrounded by columns, of which the upper are smaller and more numerous than the under. The building is raised from the ground on three steps, and terminates in a pear-shaped dome, which is famous for its echo, the sides acting as whispering-galleries. The largest B. ever erected is supposed to have been that of St Sophia, at Constantinople, which was so spacious as to have served on one occasion for the residence of the Emperor Basilicus.

BAPTISTS (sometimes called *Antipædobaptists*, as opposed to *Pædobaptists*, or those who advocate Infant Baptism*). This denomination of Christians refuse to acknowledge any great name as founder of their sect. They trace their origin to the primitive church itself, and refer to the Acts of the Apostles and their Epistles as affording, in their opinion, incontestable evidence that their leading tenets had the sanction of inspiration. When Christianity became corrupted by the rise of Antichrist, they point to the maintenance of their scripture practice among the Cathari and Albigenses and other sects of the middle ages, who, in the midst of surrounding darkness, continued to hold fast the apostolic testimony. They sprung into notice in England under Henry VIII. and Elizabeth. They were persecuted under both reigns, but they received freedom to meet for worship from James II., and complete religious liberty under William III. Ever since, they have diffused their principles extensively in Great Britain and North America; many of their ministers have done good service to the cause of science and literature, and, both as preachers and writers, have taken a position of eminence in society.

The B. hold the plenary inspiration and supreme authority of the Holy Scriptures as a revelation from God; the equal deity of the Son and the Holy Spirit in the unity of the ever blessed Trinity. But, as a condensed view of opinions cannot be expected in this work, it may be as well to state that the denomination are distinguished by almost all the shades of belief which exist in other bodies. They have among them Calvinists both *hyper* and moderate, also high and low Arminians, diverging off in every variety of shade from a common centre. The great body of them in Britain and America hold the doctrine of Calvinism in a modified form; that is to say, they maintain the *sufficiency* of the Atonement for *all men*, the limitation for which some have pleaded, they consider, lies in its *application* to the sinner by the sovereign grace of God through faith. They maintain the necessity of regeneration and holiness of life as essential to true religion, and that 'without holiness no man shall see the Lord;' and their conduct, in general, will bear a comparison with any class of their co-religionists.

Particular B., so called because holding that Christ died for an elect number, and *General* B., who maintain that he died for all men, constitute the two leading roots into which the body is divided. *English* B., in their church order and government, are the same as Congregationalists, the rite of baptism excepted. *Scotch* B., properly so called, insist on a plurality of pastors in every church, and the exercise of mutual exhortation by the members in their public assemblies. There are Baptist churches in England, however, who are *Scotch* in their order, and English B. in Scotland who are *English* in theirs. Seventh-day B., we believe, are to be found almost wholly in America, who observe not the first day of the week, but the seventh, as a day of rest. There are, besides these great divisions, various small associations of B. scattered over Great Britain, America, and the continent of Europe, whose opinions cannot be gathered up into systematic arrangement, and who would not approve of being identified with any of the sectarian designations here set down.

The particular tenet which characterises B. among their fellow-Christians is, that baptism is an ordinance the validity of which depends on an intelligent faith on the part of the recipient. Their views on the matter of baptism may be reduced to two heads—the *subjects* and *mode* of baptism. The subjects of the baptismal rite they hold to be believers in the Lord Jesus Christ. They ground their faith in this matter on the following positions—namely: 1st, The Lord in his commission to his apostles associates teaching with baptism, and *limits* the administration of the rite to *the taught*. 2d, The Acts of the Apostles shews how they understood their Master, for they baptised none but believers, or such as appeared to be so. 3d, That the kingdom of Christ as it appears in this world is restricted to credibly converted persons, as is shewn in his discourse with Nicodemus: 'Except a man be born again, he cannot see the kingdom of God;' and his subsequent statements on to the hour when he emitted his memorable confession before Pilate, 'My kingdom is not *of* this world,' uniformly proves that its subjects and institutes form a distinct and separate community from the Jewish theocracy, which embraced parents and children in nonage in one commonwealth. 4th, They maintain that the ordinance, as explained in the New Testament, always points to a moral and spiritual change, apart from which it were indeed a meaningless ceremony.

As respects the *mode*, the B. hold that only immersion in water *is* baptism. They argue, that the original term *baptizo* conveys this meaning, and no other; that nothing less can possibly answer to the apostle's explanation in Rom. vi. 4, 5, and Col. ii. 12, 'buried with him in baptism, wherein also ye are risen with him;' that the many allusions in the epistles to the churches manifestly bear out this interpretation; and, finally, that the fact of John baptising at a spot selected for the purpose '*because* there was *much water* there,' is perfectly conclusive.

Their form of church-government is congregational. They maintain that the only order of officers remaining to the church, since inspiration ceased, are pastors (otherwise called elders and bishops), deacons, and evangelists; that the number of official persons in each of the apostolic churches cannot be ascertained from the record, but must of necessity have depended—and always must depend—on circumstances; that each church is possessed of the power of self-government under its exalted head, Jesus Christ, subject to no foreign tribunal or court of review; that discipline is to be exercised by the rulers in presence, and with the consent of all the members, and parties received or excluded at their voice.

The B. are divided among themselves regarding communion—one portion receiving communicants Pædobaptists to the Lord's table and membership

* The Baptists of Great Britain and America reject the name of Anabaptists, as expressing only an accidental circumstance of their tenets, viz., the re-baptising of converts from other sects, who happen to have been baptised in infancy, and also associating them with the scandals of the German Anabaptists (q.v.) of the 15th c., from whom they claim to be historically distinct. From the same feeling, the modern sect in Germany and Holland style themselves *Taufgesinnte*.

the other refusing this privilege to any but Baptists. The churches of the former are called open communionists; the latter, strict communionists.

Next to the Moravians, the B. were earliest in the field of missions. They have been honoured to plant Christian churches in many parts of continental India, in Ceylon, in the Bahamas, the West Indies, Africa, and China. No mission band has arisen in any denomination, within the century, who have surpassed the agents of the Baptist Missionary Society in ardent zeal, patient perseverance, and invincible fortitude, in carrying out their Lord's commission to preach the gospel to every creature. The names of Carey, Marshman, Ward, and Knibb will be had in grateful remembrance by all succeeding generations; and their footsteps are now being trod by a long list of Christian missionaries of all evangelical persuasions, who are 'the messengers of the churches and the glory of Christ.'

This section of the Christian church was probably less zealous than their brethren, at one time, in preparing their ministers for their work by a sound course of study in theology and general literature; but this reproach has been long rolled away. They have schools of learning inferior to none for training young men of piety for pastoral duties, presided over by men of great ability. At Bristol, Bradford, Regent's Park (London), Pontypool, Haverfordwest, and Nottingham, there exist seminaries of learning which are entitled to give certificates qualifying for matriculation at the university of London; and many of the students have already taken degrees and honours there.

In 1870, the B. of the United States had 17,745 churches, and 1,419,493 members. In 1872, the B. in England had 4013 churches and chapels, and 177,321 members; in Wales, 1072 churches, and 55,855 members; in Scotland, 216 churches, and 7036 members; in Ireland, 77 churches, and 1492 members; in Canada, 74,220 members; in the West Indies, 23,980; in Germany, &c., 19,393.

BAR is any elongated piece of wood, metal, or other solid substance. In the iron manufacture, B. is a rod either round or square shafted. The round ones are made by drawing the iron red-hot through a bore or hole in a plate, and the square ones by passing it likewise red-hot through a roller-mill between two rollers counter-grooved, with their triangular-grooved faces forming the square opening for the passage of the iron. Railway and knee iron are made in the same manner. See the article Iron.

BAR, in Hydrography, is a bank opposite the mouth of a river which obstructs or *bars* the entrance of vessels. The B. is formed where the rush of the stream is arrested by the water of the sea, as the mud and sand suspended in the river-water are thus allowed to be deposited. It is thus that deltas are formed at the mouths of rivers. The navigation of many streams (as the Danube) is kept open only by constant dredging or other artificial means.

BAR, in Music, is a line drawn across the stave, to divide the music into small portions of equal duration; each of these small portions is itself called a *bar*.

BAR, or **BARR**, in Heraldry, one of those more important figures or charges in heraldry which are known as *ordinaries*. By the heralds of this country, the ordinaries, or, as, by way of eminence, they are called, the 'honourable ordinaries,' are commonly reckoned as ten in number, the sub-ordinaries, or minor charges, being greatly more numerous. The B., like the Fess (q.v.), is formed by two horizontal lines passing over the shield, but it differs from it in size, the fess occupying a third, the B. only a fifth part of the shield. There is this further difference between these two ordinaries, that the fess is confined to the centre, while the B. may be borne in several parts of the shield. There is a diminutive of the B. called the Closet, which is half a B.; and again of the closet, called the Barrulet, which is half a closet, or the fourth part of a bar.—BAR-GEMEL is a double bar, from the French *jumeau*, f. *jumelle*, a twin.

Bar.

BAR, in Law. This word has several legal meanings; thus, it is the term used to signify an enclosure or fixed place in a court of justice where lawyers may plead, or perhaps more correctly, where they can address their advocacy on behalf of their clients. A veiled-off space within the Houses of Parliament is similarly called the B. See PLEADING. The dock, or enclosed space where persons accused of felonies and other offences stand or sit during their trial, is also called the B.; hence the expression, 'prisoner at the bar.' This word is likewise applied to the gate or rail thrown across a turnpike road for the levying of the toll-duties. It has also a general meaning in legal procedure, signifying something by way of stoppage or prevention. There is also a trial at B., that is, a trial before the judges of a particular court, who sit together for that purpose *in banc* (q.v.). See the following articles: BAR OF DOWER, PLEA, TRIAL AT BAR, TOLL, FELONY, TREASON, BARRISTERS, ADVOCATE.

BAR OF DOWER. Dower, the estate or provision which, by the law of England, a widow is entitled to out of the lands and tenements of her deceased husband, may be barred or defeated by her elopement, her divorce on the ground of her own adultery, the treason of her husband, and other disabilities, and by detaining the title-deeds or evidences of the estate from the heir until she restores them. A woman might also, while fines and recoveries were in force, be barred by these assurances, as she now may by the new method of conveyance appointed by the statute 3 and 4 Will. IV. c. 74, in substitution for a fine or recovery, in the case of a married woman. And another method of barring dower is by jointure, as regulated by the statute 27 Henry VIII. c. 10.—Stephen's *Commentaries*, vol. i. p. 273. See DOWER, JOINTURE, WIDOW, and FINE OF LANDS.

The term corresponding to Dower in Scotch law is TERCE (q.v.), which may also be barred or excluded in various ways; as, for instance, by the widow's express discharge or renunciation, by the deeds of the husband affecting his real estate, by the husband's conviction for treason, by the wife's express acceptance of a different provision in lieu of the terce, and by her divorce on the ground of adultery.

BAR, PLEAS IN. See the articles PLEADING and PLEA.

BAR, TOLL. See TOLL.

BAR, TRIAL AT. See TRIAL AT BAR.

BARABA', a steppe of Siberia, extending between the rivers Obe and Irtish, and occupying more than 100,000 square miles, and covered with salt lakes and marshes. It was colonised by the Russians in 1767, who have since cultivated parts of it.

BARACOA, a seaport town on the north-east coast of Cuba, belonging to the Spaniards. Lat. 20° 22' N., long. 74° 30' W. In its vicinity is a remarkable mountain called the Anvil of Baracoa.

BARAGUAY D'HILLIERS, LOUIS, a distinguished general of the French empire, was born in

Paris in 1764. After serving under Custine and Menou, he received an appointment in the army of Italy from Napoleon, and was a sharer in all the success of the campaigns of 1796—7. He was made a general of division; and in virtue of Napoleon's treaty with the Venetian Republic in May 16, 1797, commandant of Venice. B. accompanied the expedition to Egypt; and afterwards successively held appointments in the armies of the Rhine, and the Tyrol, and in Catalonia. He headed a division in the Russian campaign of 1812; but on the retreat, he incurred the displeasure of Napoleon. He was sent as governor to Berlin, where he soon after died of grief and exhaustion.

BARAGUAY D'HILLIERS, ACHILLE, a French general, the son of the preceding, was born in Paris on the 6th of September 1795. He rose rapidly through the inferior military grades, and obtained, in 1832, the appointment of governor in the military school of St Cyr, where he suppressed a republican conspiracy that threatened to break out in the institution. After he had served with various success in more than one campaign in Algeria, he was promoted to the rank of lieutenant-general, on the 6th of August 1843; and in 1847, he was made inspector-general of infantry. After the revolution of February 1848, he was chosen a member of the National Assembly, in which he joined the party of reaction, and was in favour of the restriction of the press. In the beginning of November 1849, he went to Rome, as commander-in-chief of the French army sent to sustain the authority of the pope. He returned in 1850; and in January 1851 obtained the command of the army of Paris, in the place of Changarnier. B. concurred in the policy of the *coup d'état* of December 1851, and was made a member of the Consultative Commission. During the Crimean war, he received the command of the French expeditionary corps of the Baltic, and co-operated with the British fleet in the capture of Bomarsund. He was afterwards made a Marshal of France, and commanded in the Italian war of 1859 with distinction. In Oct. 1871, he was made president of the Court of Inquiry appointed to investigate the conduct of the French generals who surrendered fortified places during the late war.

BA'RAS KHOTU'N, or BARS KHOTAN, a ruined city on the banks of the Kherlon, one of the head-streams of the Amur, in the Mongol country. Some suppose it to have been built by the Emperor Kublai; others, that it was erected by Toghon Timur in the 14th c., after the expulsion of the Mongols from China. The remains of the mud-walls shew that the city had been 5 miles in circumference.

BARB, the designation of a noble breed of horses cultivated by the Moors of Barbary, and introduced by them into Spain. Barbs are less remarkable for their beauty and symmetry, than for their speed, endurance, abstinence, and gentle temper.

BA'RBACAN. See BARBICAN.

BARBA'DOES, the most easterly of the Caribbees, and the residence of the governor-general of the British Windward Islands. See ANTILLES. The lat. and long. of its capital, Bridgetown, are 13° 4′ N., and 59° 37′ W. Its area is about 166 square miles, or 106,240 acres—the unprecedented proportion of 100,000 being under cultivation. Besides the capital, B. contains 3 other towns, all more or less in a state of decay—Jamestown, Speights-town, and Oistin. B. affords no harbours, being almost encircled by coral-reefs, which here and there extend as much as 3 miles to seaward. Inside of the coral-reefs, the coast, excepting at two points, presents long lines of sandy beach—one of the most remarkable being Carlisle Bay with its exposed roadstead, on which Bridgetown stands. Setting aside occasional attacks of yellow fever, the climate is healthy. In 1844, the fall of rain was 72 inches; and the temperature is said to have ranged only between 76½° and 83½° F. Shocks of earthquake are sometimes felt, and thunder-storms are frequent and severe. But hurricanes are the great scourge of Barbadoes. In 1780, one of them destroyed 4326 persons, and property to the value of £1,320,564 sterling; and in 1831, another destroyed 1591 persons, and property to the value of £1,602,800 sterling. Of the former of these, the violence appears to have surpassed all belief—the winds and the waves between them having carried a 12-pounder gun a distance of 140 yards.

In 1834, the commencement of the apprenticeship under the imperial act of emancipation, the population was 102,231; by 1871, it had increased to 162,042, being an average of 976 inhabitants to every square mile. The trade and the revenue bear a similar testimony to the benefits of emancipation. Between 1833 and 1870, the revenue had increased from £20,975 to £101,932; the imports from £481,610 to £1,069,868; the exports from £408,363 to £973,829; the total tonnage entered and cleared in 1870 was 278,517 tons. During that year, sugar was exported to the value of £594,690; molasses, valued at £98,383; and wheat, at £71,298. Being universally cultivated in regular plantations, the island affords no room for the squatting of negroes on unreclaimed lands, as in Jamaica and other West-India possessions. On this account, if from no other cause, the negro population have been compelled to labour diligently for hire, and are generally in a condition most creditable to their industry and prudence—contrasting, in this respect, with the improvidence and indolence of some of the lower classes among the whites. Altogether, however, the Barbadians are a shrewd and clever people, nor are they deficient in a due appreciation of their own power and importance. B. is the see of a bishop. It contains also many well-endowed seminaries—Codrington College, in particular, having a revenue of £3000 a year. It was first colonised by the English in 1625, having previously been depopulated by the Spaniards.

BARBA'DOES CHERRY, the name given in the West Indies to the fruit of two small trees, *Malpighia urens* and *M. glabra*, which are cultivated for its sake. Clusters of fruit are produced from the axils of the leaves. The fruit of *M. urens* is small, that of *M. glabra* is like a Mayduke cherry in size and appearance, but inferior in flavour. Each fruit contains three triangular seeds. The leaves of *M. urens* have stinging hairs on the under-side. See MALPIGHIACEÆ.

BARBA'DOES GOOSEBERRY (*Pereskia aculeata*), a pleasant West Indian fruit, produced by a plant of the natural order *Cactex* (q. v.), with a round stem, thick flat alternate leaves, and large strong spines. The fruit has expectorant properties.

BA'RBARA, SAINT, who suffered martyrdom at Nicomedia, in Bithynia, about 236, or, according to other accounts, at Heliopolis, in Egypt, about 306, was of good birth, and well educated by her father, Dioscorus. To avoid disturbance in her studies, he had a tower built for her, where she spent her youth in the deepest solitude. While in this retirement, she was led, through Origen, as is said, to embrace Christianity. Her father, a fanatic heathen, learning his daughter's conversion, and failing to induce her to renounce Christ, delivered her up to the governor, Martianus, to be dealt with by the law. Martianus, struck with the intelligence and beauty of the maiden, attempted first by arguments to make her

relinquish Christianity, and when that failed, had recourse to the most exquisite tortures. At last, the blinded father offered himself to strike off his daughter's head. Scarcely was the deed done, when he was struck with lightning. Hence St B. is to this day prayed to in storms. For the same reason, she is the patron saint of artillery, and her image was at one time frequently placed on arsenals, powder-magazines, &c. The powder-room in a French ship of war is to this day called Sainte-Barbe. St B.'s day is the 4th December.

BARBAREA. See CRESS.

BARBARIAN (Gr. *barbaros*), among the Greeks, as early as the time of Homer, signified one who could not speak the Greek language; and this restricted signification was not wholly obsolete even in the age of Plato, for the latter divides the entire human race into *Hellenes* and *Barbaroi*. The origin of the word is unknown, if it be not artificially formed, on the principle of imitation, to represent a meaningless babble of sound, such as the Greeks conceived all foreign languages to be. It first began to acquire its secondary and invidious signification at the period of the Persian wars. The Greeks, who always exhibited a proud consciousness of their superior intellect and privileges, employed the term to designate the character of their enemies. It then meant whatever was opposed to Greek civilisation, freedom, or intelligence; but it could not yet have attained the degraded sense in which it is now used, for the Romans in the time of Plautus accepted the appellation, and called themselves *Barbari*. Subsequently, when Rome, under Augustus, became the mistress of the world, the word was applied to all the Germanic and Scythian tribes with whom she came into contact. In modern times, B. signifies savage, uncivilised, or ignorant.

BARBAROSSA. See FREDERICK I.

BARBAROSSA, ARODJE or HARUJ and KHAIR EDDIN, two brothers, renegade Greeks, natives of Mitylene, who, as Turkish corsairs, were the terror of the Mediterranean during the first half of the 16th c. They made themselves masters of Algeria (q. v.) and Tunis, and brought these countries under the sovereignty of the Turkish sultan.

BARBAROUX, CHARLES, one of the most distinguished and energetic of the Girondists, was born at Marseille in 1767. The new ideas of equality and fraternity found in B. a warm advocate, and he did much to promote their spread. He was elected the special delegate of Marseille, to attend the Constituent Assembly at Paris. There he opposed the court, and took part with the minister, Roland, then out of favour. After the events of the 10th of August, he returned to his native town, where he was received with enthusiasm, and was soon after chosen delegate to the Convention. In the Convention, he adhered to the Girondists, and belonged to the party who, at the trial of the king, voted for an appeal to the people. As B. boldly opposed the party of Marat and Robespierre, and even directly accused the latter of aiming at the dictatorship, he was, in May 1793, proscribed as a royalist and an enemy of the republic. He wandered about the country, hiding himself as he best could, for thirteen months, when he was taken, and perished at Bordeaux by the guillotine, June 25, 1794. B. understood the revolutionary crisis much better than the most of his party. Had the Girondists generally possessed anything like his energy and sagacity, the Jacobins must have succumbed, and much bloodshed and horror would have been spared to France and the world.

BARBARY, an extensive region in Northern Africa, comprising the countries known in modern times under the names of Barca, Tripoli Proper, Fezzan, Tunis, Algeria, and Morocco, together with the half-independent province of Sus; and in ancient times, under those of *Mauritania, Numidia, Africa Propria*, and *Cyrenaica*. It stretches from Egypt to the Atlantic Ocean, and from the Mediterranean to the Desert of Sahara, or between long. 10° W. and 25° E., and lat. 25° 37° N. The north-west of this region is divided by the Atlas Mountains into two parts: the northern comprising Morocco, Algeria, and Tunis; the southern, a half-desert region, called Beled-el-Jerid, the country of dates. Though pertaining geographically to Africa, B. is not specially African in any of its characteristics; but in climate, flora, fauna, and geological configuration, belongs to that great region which forms the basin of the Mediterranean. It is watered by many small streams, which either flow into the Mediterranean or into the salt-lakes on the edge of the Desert, according as they rise on the northern or southern slopes of the Atlas Mountains. A large portion of the country is capable of cultivation, and sandy or rocky tracts are rare, except on the southern margin. During the times of the Carthaginians, Greeks, and Romans, it was richly fertile, and all the natural conditions of its ancient productiveness still remain.

For an account of the climate, geology, productions, &c., see the various countries.

Among the people, besides the French and other Europeans, seven distinct races may be enumerated: Berbers (or Kabyles), Moors, Beduins, Jews, Turks, Kuluglis, and Negroes. The Berbers and Beduins inhabit the open country, while the Moors, on the other hand, reside in the towns. Most of the Berber tribes are either wholly free, or subject to the mere nominal jurisdiction of native chiefs, kaids, judges, &c. The Beduins luxuriate in equal liberty. Jews had settled here in ancient times, but the greater number of that race immigrated when the Moors were expelled from Spain. The Turks entered B. in the 16th c. They form the dominant race in Tripoli and Tunis, but never established themselves permanently in Morocco. Their sway in Algeria was brought to an end by the French. The Kuluglis (the children of Turks by native mothers) are excluded from the possession of all the paternal rights and privileges. The negroes are not natives of B., but are brought thither as slaves, principally from Sudan and Guinea. They are for the most part domestic slaves. The population, exclusive of Jews and Christians, is about 10,000,000, all Mohammedans. Arabic is the language of commerce and not of course, and in Morocco, the language of government, and the mother-tongue of Beduins, Moors, and even Jews; but in Tunis and Tripoli, where, as we have said, the Turks are still dominant, the language of government is Turkish. The Berbers Proper, or Kabyles, especially in the highlands, to which they have been driven by foreign conquerors, use a peculiar speech among themselves.

In the oldest historical times, we find the Mauri (the ancestors of the modern Moors) mentioned as residing in the north-west of B., the Numidians in the interior and eastern parts, and the Phœnician colonies on the coast. These last people formed settlements and founded cities among them at Utica, Hippo, Hadrumetum, Leptis, and afterwards Carthage, about 1000 B.C. It does not appear that they ever penetrated far into the interior. Confining themselves to the coast between the Great Syrtis and the Straits of Gibraltar, they maintained commerce with the people of the interior and the seaport of the Mediterranean. In the 7th c. B.C., the Greeks founded Cyrene, considerably to the east of Carthage, and colonised the plateau of Barca, now styled Jebel-el-Achdar by the Arabs. While the

Phœnician colonies held sway on the coast, the Mauri and the Numidians were divided into several independent tribes, and, like their neighbours the Getuli, were wholly uncivilised. After the second Punic war, the Romans extended their sway over Carthaginian Africa, which became a Roman province at the close of the third Punic war, when the city of Carthage was sacked and destroyed. Numidia was 'annexed' after the victory over Jugurtha, and Mauritania after the defeat of King Juba, the ally of Pompey's party. The son of Juba, bearing the same name, was allowed to reign as a nominal sovereign by Augustus; but Mauritania was, in fact, a Roman province. Thus, the Romans had acquired a territory in Africa extending from the Great Syrtis to the Atlantic (corresponding to the modern states of B.), which formed some of the largest and most flourishing provinces of their vast empire. Everywhere they built large towns, whose extensive ruins are still to be seen scattered over the whole land, even to the verge of the Desert; as, for instance, those at El-Haman, in the regency of Tunis, at Sava, Musulupium, and especially the splendid city of ruins, Lambasa, not far from the Desert of Sahara. The Romans had, in general, only two legions, numbering 24,000 men, in their African provinces; nevertheless, their authority was uncontested, and they were enabled to undertake important works, such as the cisterns and aqueducts at Rusicada, Hippo, and Cirta, and the temples and amphitheatres of Calama and Anuna, which clearly shew that the inhabitants enjoyed the benefits of a safe and powerful civilisation.

Under Constantine, North Africa was divided into the several provinces, Mauritania-Tingitana, Mauritania-Cæsariensis (on the east of the former), Mauritania-Sitifensis, Numidia, Zeugitania, Byzacium, Cyrenaica, and the Regio Syrtica. At the division of the empire, the whole of these provinces, with the exception of the last, fell to the share of the Western Empire. About this time, Christianity was promulgated in Africa, and with such success, that in the three Mauritanias there were more than 160 dioceses. As Roman power declined in Europe, the consequences were severely felt in the African provinces. Religious disturbances, native revolts, and the ambitious aspirations of the Roman governors after independence, loosened the political bands which bound the provinces together, and made them an easy prey to the Vandals, who landed in Africa, in 429 A.D., under the ferocious Genseric, and in an incredibly short space of time overran the country, which they savagely misgoverned until 533, when they were defeated by Justinian's great general, Belisarius. Meanwhile the Numidians and the Mauri had made themselves masters of the interior and of the coast of Mauritania-Tingitana, and the Greek-Roman territories were restricted to the neighbourhood of Carthage and some points on the coast. The whole country of B. was thus made an easy prey for the Arabs, and in 647, Abdallah-ben-Said, with 40,000 fanatical Mohammedans from Egypt, defeated and slew the Greek prefect, Gregorius, at Tripoli. He did not, however, follow up his victories; but in 665—670 A.D., the Arabian general, Akbah, conquered the coast-towns of Tripoli, founded Cairo, and extended his sway almost to the Desert. Hassan, the general of the Calif Abd-el-Malek, in 692, stormed, plundered, and destroyed the new Carthage, and, in fact, annihilated the Greek-Roman dominion in Africa. In the course of less than a century, the greater part of the native tribes were converted forcibly to the faith of Islam. In 789, the western provinces separated themselves from the others, and Edris-ben-Abdallah founded there the dynasty of the Edrisites. After 800, when the governor, ben-Aglab, declared himself independent, founded the dynasty of the Aglabites. A lost to the califs. From this time down the changes of dynasty in B. were so frequent we cannot here describe them in detail. The were, that independent states arose in Algeria, Bugia, Tenez, &c. About this time, also, reaction of the Christian world against danism in North Africa and Spain. St took an expedition against Tunis. The by and by, expelled from Spain, and selves on the coast of Northern Africa, begin that course of piracy by which they odious to Europe, first as a fierce retaliation their Christian persecutors, but ultimately barbarous profession. As early as the Ferdinand the Catholic, the Spaniards check their insolent ravages, and landed on several occasions, capturing the Melilla, Oran, Bugia, the island befo Tripoli. The Portuguese landed on Marocco, where at first they had great they were ultimately compelled to leave After various changes of fortune, Algiers, Tripoli were brought under the governm sultan. Since 1830, however, the first of ALGERIA) has been under French sway. many years the other two have been dependent on the Turkish ruler. A a much earlier period, befell the wes where the successors of the Arabian Mehemed, overthrew the kings of Mar and established the Sherif dynasty, which the present day over these lands.—Shaw's *and Observations relative to several Parts* Mauroy, *Du Commerce des Peuples de l Septentrionale* (Par. 1845).

BA'RBARY APE, PI'GMY APE, a small species of ape or tailless monkey, as the only one of the monkey-race which in Europe. The only European locality, how which it occurs is the Rock of Gib said to have been originally br t of Africa. It inhabits the pre Rock, inaccessible to human foot, measure of protection from firearms is the amusement afforded by its manners garious, and large numbers are often seen the females carrying their young upon their In some parts of the north of Afri

Barbary Ape.

extremely abundant, inhabiting rocky and woods. It displays great agility in p tree to tree, and its bands often plunder of their number keeping careful watch on fruits, roots, &c.; and its fondn supposed to have given rise to

the battle of the pigmies and the cranes. It is of a greenish-gray colour, paler underneath; and in size resembles a large cat. The characters agree with those of the genus *Macacus* (Wanderoo Monkey, q. v., &c.), except that the tail is reduced to a mere tubercle. The muzzle is somewhat elongated, although not nearly so much as in the baboons, with which this ape has sometimes been classed, and the facial angle is much higher than in them. The face is almost naked, and somewhat wrinkled. The ears are in form not unlike human ears. The eyes are round, reddish, and of great vivacity. The B. A. is one of the monkeys most frequently to be seen in captivity, at least in Britain; and possessing a considerable degree of intelligence, is capable of being trained to many tricks. In order to this, however, it must be taken young, as the older ones are often sullen and mischievous. It usually walks on four feet, although it can be trained to stand or walk, in a more awkward manner, on two. It is filthy in its habits.

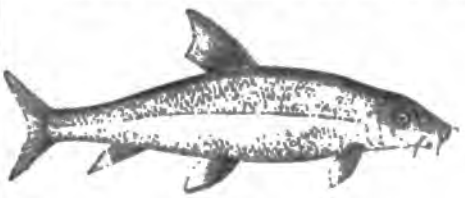
BARBASTE'LLE. See BAT.

BARBA'STRO, a walled town of Spain, in the province of Aragon. It is situated on the Vero, has a cathedral with some paintings by Antonio Galceran. Pop. 6500.

BA'RBAULD, ANNA LETITIA, an English authoress, was born at Kibworth-Harcourt, in Leicestershire—where her father, the Rev. John Aikin, a dissenting clergyman, kept an academy—on the 20th June 1743. Her private education, the religious influence of her home, and secluded life in the country, were well fitted to develop early her natural taste for poetry; but it was not until 1773 that she was induced to give her effusions to the public, who appreciated them so highly that four editions were called for during the year. Encouraged by this, she the same year, conjointly with her brother, published *Miscellaneous Pieces in Prose* (Lond. 1773), which also passed through many ions. In the following year, the poetess married Rev. Rochemont Barbauld, a dissenting minister Palgrave, in Suffolk, in which village the newly ied pair opened a boarding-school for boys. literary fame and the assiduity of Mrs B. soon e it celebrated. During the ten years Mrs B. engaged in the duties of tuition here, she pub- ed *Early Lessons for Children*, and *Hymns in Prose*, works which have been often reprinted in England for youthful readers, and translated into several languages. Her *Devotional Pieces* was also published during this period. In 1792, she commenced with the brother previously mentioned—who wrote the most of them—the well-known series, *Evenings at Home*, which were completed in three years. In 1795 she edited Akenside's *Pleasures of Imagination*, and Collins's *Odes*, prefixing to each a critical essay. In 1804, she began to edit a selection from the *Spectator*, *Guardian*, *Tatler*, &c.; and in 1810 published a collection of the British Novelists, the task of editing which she had undertaken to divert her mind from the loss she had sustained two years previously in the death of her husband. *The Female Spectator* (Lond. 1811) contains a selection from her writings. Her last poetical effort was an ode, entitled *Eighteen Hundred and Eleven* (Lond. 1812). All her compositions are characterised by simplicity of feeling, an easy, flowing style, and pure and elevated sentiment, and give token of a mind well versed in classical literature. She lived in quiet retirement till her death, which happened on the 9th March 1825. The life of Mrs B. has been written by Lucy Aikin, also known as an authoress, and prefixed to the collection of the *Works of A. L. Barbauld* (2 vols., Lond. 1825). The same lady also published from the posthumous papers of the authoress, *A Legacy for Young Ladies* (Lond. 1826).

BA'RBED AND CRE'STED, heraldic terms, by which the comb and gills of a cock are designated, when it is necessary to particularise them as being of a different tincture from the body. The common English term is *Wattled and Combed*, gules, or whatever else the tincture may be.

BA'RBEL (*Barbus*), a genus of fishes of the family of the *Cyprinidæ* (q.v.), differing from *Cyprinus* (Carp, Gold-fish, &c.) in the short dorsal and anal fins, in having one of the rays of the dorsal fin strong and serrated, and the mouth furnished with four soft barbules (whence the name B., from Lat. *barba*, a beard), two near the point of the snout, and one at each angle of the mouth. The



Barbel.

upper jaw also extends considerably beyond the lower. The species are numerous. Like the other Cyprinidæ, they are all inhabitants of fresh water, and generally of muddy ponds and rivers, where they seek food by ploughing up the mud with their snouts, like swine, and are said often to seize the small fishes which come to share with them the worms and insects of the mud. They also feed upon the leaves and roots of aquatic plants.—The Common B. (*B. vulgaris*) is abundant in many of the rivers of the temperate parts of Europe. It is the only species found in Britain, and only in some of the still and deep rivers of England. It is very abundant in the Thames, frequenting the weedy parts of the river in shoals in summer, and seeking the deeper water in winter, becoming so torpid during cold weather, that the fishermen sometimes take it with the hand, or by pushing it with a pole into a small net fastened to an iron hoop. It grows to a large size, sometimes 3 feet in length, and 15 to 18 pounds in weight; it is rather of a long shape, in section nearly circular; the general colour of the head and upper part of the body, greenish brown, becoming yellowish green on the sides, the belly white, the tail somewhat forked, and of a deep purple colour. It affords sport to anglers, but is a very coarse fish, and little used for food except by the poor, who often boil bacon with it to give it a relish. The larger barbels are esteemed the best. The roe has poisonous qualities, although its effects are disagreeable rather than permanently injurious.

Another species, called the Binny, or B. of the Nile, is very abundant in that river; attains a very great size, 70 lbs. or upwards; is much esteemed for food; and is taken by hooks baited with dates steeped in honey. A number of baited hooks, each attached to a separate strong line, are enclosed in a mass of clay, flour, dates, &c., which is sunk in the river, and to which, as it begins to dissolve, the binnies are attracted; when boring into it with their snouts, and devouring the dates, they are caught. The fish being generally hooked by the projecting upper jaw, is allowed to remain in the water, the line being fastened on shore, and is taken out when wanted for immediate use.

BA'RBEL, ANGLING FOR. The B. is a ground-feeding fish, grubbing on the bottom for his sustenance.

The baits principally used to capture him are worms and maggots, greaves, and cheese; and the means of angling for him are chiefly with a dead-line, called a ledger, or with float-tackle. The ledger is a perforated leaden bullet; through this the line runs freely. To prevent its slipping down on the hook, a large shot or other substance is fastened on the line, about a yard above the hook. The hook (about No. 5 or 6 in size) is baited either with a lob-worm or greaves, and the lead is cast into the water, and remains motionless on the bottom. When a fish bites, the angler feels the tug, and strikes smartly; as the fins of the B. are large, and his muscles powerful, he frequently offers considerable resistance. The rod used for ledger-fishing is short and stiff. In float-fishing for B., the tackle is finer, and the hook smaller. A cork-float suited to the depth and rapidity of the river is used, and it is fixed at such a height upon the line that the bait just touches the bottom. The instant the float disappears, the angler strikes, but not so forcibly as in ledger-fishing. Previous to angling for B., it is desirable to bait the place to be fished, for the purpose of drawing the fish together. This is accomplished by chopping up and casting into the water from 500 to 1000 lob-worms, and it should be done 18 or 20 hours before fishing. In float-fishing for B., the float should be allowed to travel down a considerable distance of water, at least 30 or 40 yards, in order that no spot where a portion of the worms may have lodged should be missed. This is sometimes done by the use of a float called a slider, which is not fixed on the line, but by the management of the angler, accommodates itself to the depth of the water. In this fishing, the bait trails along the ground, and the rod should be at least 14 or 15 feet in length, and the line very light and fine. B. will sometimes take a spinning bait, and are often caught by the angler while trout-fishing; but this is by no means a certain method of angling for them. The B. may be said to be gregarious; he spawns in May or June, choosing some gentle shallow for that purpose. He soon recovers his strength again, however; and about the end of July, he seeks the deep rapid streams, and may be seen vigorously springing from the water in his endeavours to rid himself of the parasitical insects which attach themselves to him during his quiescence. Here he remains the greater part of the summer and autumn. Frosty weather renders the B. torpid, and he takes shelter under some large stone or weed, where he can lie up during the winter. Although the B. is by no means an estimable fish for the table, it is much used by the Jews in their fasts and festivals.

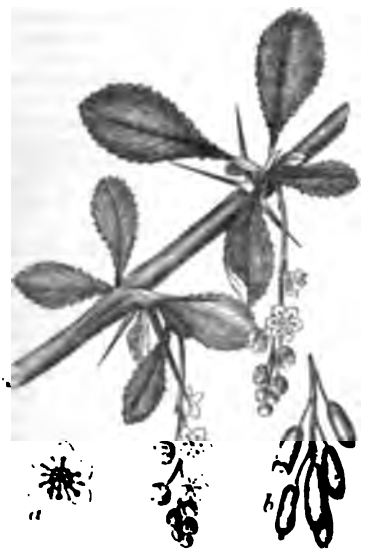
BARBER (Lat. *barba*, the beard), a shaver of the beard, and who ordinarily includes hair-cutting in his profession. Barbers are of great antiquity, if not for the shaving of the beard, at least for shaving a portion of the head. The office of the B. is referred to by the prophet Ezekiel: 'And thou, son of man, take thee a barber's razor, and cause it to pass upon thine head and upon thy beard.' —Ezek. v. 1. In all oriental countries, including China, the shaving the whole or part of the head continues to be performed by barbers. In every part of the world, the professional B. and hair-dresser is celebrated for his garrulity and general obliging qualities, such being required by those who place themselves in his hands. The amusing character of the B. in one of the tales in the *Arabian Nights Entertainments*, and also of the B. in Rossini's opera of *Figaro*, will readily occur to recollection. As will be seen from the succeeding article, barbers at one time acted as a kind of surgeons, and accordingly occupied a higher social position than they now enjoy. Latterly, on account of the simple mode of trimming the hair, and of the prevalence of private shaving, the business of the B. in England has greatly declined, and his services are chiefly confined to the humbler classes. In the United States, the business of the B. is almost exclusively in the hands of the coloured population. Anciently, one of the utensils of the B. was a brass basin, with a semi-circular cup in one side to compass a man's throat, by which means, in applying the lather to the face, the clothes were not soiled. Readers will recollect that Don Quixote crazily assumed a barber's basin as a helmet. At the end of a pole, the brass basin is still hung out as a sign at the door of the B. in Great Britain, France, and other countries.

BARBER-SURGEONS. In former times, as stated in the foregoing article, barbers acted as a kind of surgeons, or at least phlebotomists, and such appears to have been the case in all countries. To this day, on the pole on which the barber's basin is suspended, there is represented a twisted or spiral ribbon, which symbolises the winding of a fillet round the arm previous to blood-letting. In London, Edinburgh, and elsewhere, the B. formed corporations with certain privileges. The surgical duties of these bodies now pertain to the corporations of surgeons. The existence of B. as professors of the healing art, in England, can be traced as far back as the reign of Edward IV. in 1461, when they were first incorporated; and from then till the reign of Henry VIII., when they were united with the surgeons, until the time of George II., when the B. ceased to be anything but barbers, as we now understand the term. In the latter reign, an act was passed, the 18 Geo. II. c. 15, from the preamble of which we learn that not till then had the discovery been made that the business or trade of a barber was 'foreign to, and independent of, the practice of surgery;' and it therefore proceeds to dissolve the connection between the two bodies, and to remit the B. to the more humble functions they now perform. But this is done with an express saving of all their privileges as a company or corporation, and as such they exist to the present day. See an interesting account of them in Knight's *History of London*, vol. ii. pp. 177—192, which concludes with the following curious extract from the list of officers to Heriot's Hospital in the statutes of that charity compiled in 1627: 'One chirurgeon barber *who shall cut and pole the hair of all the scholars of the hospital*; and also look to the *cure* of all those within the hospital who *anyway* shall stand in need of his *art*.' And see the Report of the Royal Commissioners appointed to inquire into the corporations of London, and printed in 1837, in which all particulars relating to the government and working of this c[illegible] the present day are given. The report [illegible] the company exists 'for using and exe[illegible] and mystery of barbers, which inc[illegible] within the suburbs and liberties [illegible] it concludes as follows: 'The c[illegible] extensive powers for the regul[illegible] but in practice none are exercis[illegible] except [illegible] of compelling all persons using the trade [illegible] of barber (which, as before mentioned, include dressers) within the city to become free [illegible] company.' The barbers still retain their ancie[illegible] —which they possessed before the [illegible] disunited from them—in Monkwell [illegible] gate, in the city of London. See [illegible] SURGEONS, TRADE CORPORATIONS.

BARBERINO-DI-MUGELLO [illegible] Tuscany on the Siere, 11

a population of 9000, engaged in the manufacture of straw-hats. The royal villa of Caffegiolo, the ancient residence of the Medicis, stands in the environs.—B. Di Val-d'Elsa, a village in the same district, with a beautiful situation on the ridge between the valleys of the Pesa and Elsa, and celebrated as the place where Pope Urban VIII. was born. One of the palaces of the Barberini is here.

BARBERRY (*Berberis*), a genus of plants, of the natural order *Berberideæ* (q. v.). All the species, which are numerous, and found in temperate climates in most parts of the world except Australia, are shrubs with yellow flowers, having a calyx of six leaves, a corolla of six petals, and six stamens, which, when touched at the base, display a considerable degree of irritability, starting up from their ordinary position of reclining upon the petals,



Common Barberry (*Berberis vulgaris*): *a*, a flower; *b*, ripe fruit.

and closing upon the pistil, apparently a provision to secure fecundation. The fruit is a berry with two or three seeds. Not a few of the species are evergreen. They are divided into two sub-genera, sometimes ranked as genera; those with simple leaves forming the sub-genus *Berberis*, and those with pinnate leaves the sub-genus *Mahonia*, or Ash-leaved B.—The Common B. (*B. vulgaris*) is a native of most of the temperate parts of Europe, Asia, and North America. It produces its flowers and fruit in pendulous racemes; has obovate, slightly serrate, deciduous leaves; and numerous straight three-forked spines. It is a very ornamental shrub, especially when covered with fruit. Its berries are of an elongate oval form; when ripe, generally of a bright red colour, more rarely whitish, yellow, or almost black. They contain free malic acid. The fruit of the ordinary varieties is too acid to be eaten, but makes excellent preserves and jelly. Malic acid (q. v.) is pretty extensively prepared from it in France. A yellow fungus, *Æcidium Berberidis*, is very general upon the under-side of the leaves of the B.; and a notion prevails that it produces *rust* in corn, which is erroneous, the rust (q. v.) of corn being a totally different fungus, which, like this, is apt to appear in humid weather. The prevalence of this notion, however, appears to have prevented the general employment of the B. as a hedge-plant, for which it is admirably adapted, hedges made of it being easily kept free from gaps, and becoming more and more impervious by new shoots thrown up from the root. The yellow root of the B. is used for dyeing yellow, and especially the inner bark of it, and also of the stem and branches. The bark is capable of being employed for tanning leather. In like manner, *B. glauca*, *B. ilicifolia*, *B. tomentosa*, and *B. lutea* are used for dyeing in Chili and Peru; *B. tinctoria* by the inhabitants of the Neilgherry Hills, and *B. aristata* in Nepaul; and a strong similarity of properties appears to pervade the whole genus. *B. Lycium*, a native of the north of India, is characterised by great astringency, and an extract prepared from it is valuable in ophthalmia. Most of the species are more or less spiny, and some of the evergreen species might be very ornamentally employed for hedge plants; as *B. dulcis*, now frequent in shrubberies in Britain. This species, sometimes called the Sweet B., is a native of the south-west coast of America. Its leaves much resemble those of the common B.; it has solitary flowers on rather long stalks, and globose black berries about the size of a common black currant. The fruit is produced very copiously in Britain, is quite sweet when fully ripe, and makes excellent jelly. When unripe and very acid, it is used for tarts. Pleasant fruits are produced also by *B. aristata* and *B. Asiatica*, the berries of both of which are dried in Nepaul, after the manner of raisins; *B. concinna*, also a Himalayan species; *B. microphylla*, found in the southern parts of South America; and *B. trifoliata*, found in Mexico. Those of some of the other species are either disagreeable or insipid, which is particularly the case with most of the ash-leaved barberries, natives of North America and the north of India.—Numerous species of B., both from the Himalaya and South America, are daily becoming more frequent in Britain as ornamental shrubs.

BARBET (*Bucco*), a genus of birds generally placed by ornithologists in the family of the *Picidæ*, or Woodpeckers (q. v.), but regarded as the type of a very distinct sub-family, exhibiting points of resemblance to the cuckoos. They have a large conical beak, surrounded with tufts of bristles directed forwards - a characteristic from which the name B. is derived (Lat. *barba*, a beard). They prey on insects, and some of them also on young birds; some are at least partially frugivorous. They inhabit warm parts both of the eastern and western hemispheres, and most of them are birds of gay plumage. The Linnæan genus has been subdivided, and includes, besides the true barbets, the Barbacoas (*Monasa*), South American birds - the Barbicans (*Pogonias*) of Africa and India - the American Puff-birds (*Tamatia*), &c. The Puff-birds are remarkable for erecting their plumage till they resemble a round ball. Being birds of short wing, both they and the true barbets wait for their prey, generally sitting with great patience on some withered branch till it comes near them, when they suddenly dart upon it. They often choose positions close to human habitations, and shew little fear.

BARBETTE, an earthen terrace inside the parapet of a rampart, serving as a platform for heavy guns; it has such an elevation that the guns may be fired over the crest of the parapet instead of through the embrasures, to give them a freer scope by swivelling round into different directions.

BARBICAN (Ital. *barbacane*), a projecting watch-tower, or other advanced work, before the gate of a castle or fortified town. The term B. was more specially applied to the outwork intended to defend the drawbridge, which in modern fortifications

is called the *tête du pont*. 'To begin from without, the first member of an ancient castle was the B., a watch-tower, for the purpose of descrying an enemy at a greater distance' (Grose's *Antiquities of England and Wales*), and, to the same effect, Camden, speaking of Bedford Castle, says it was taken by four assaults; in the first was taken the B.; in the second, the *outer* balia. See BAILEY. See also Parker's *Glossary of Architecture*. There are

Barbican.

a few perfect barbicans remaining in England, as at Alnwick and Warwick; but the best examples of it, as of the other parts of the fortification of the middle ages, are probably to be seen in the town of Carcassone (q. v.). A very curious and minute account of the siege of Carcassone in 1240, in the form of a report to Queen Blanche by the seneschal who defended it, preserved in the archives of France, has been published in Hewitt's *Ancient Armour* (p. 355, *et seq.*), in which the uses of the B. are fully illustrated. The street called Barbican in London, near Aldersgate Street, marks the site of such a work, in front of one of the gates of the old city.

BARBITON, or BARBITOS, a stringed instrument of the ancient Greeks, made of ivory, in the form of a lyre, with seven strings, and said to have been invented by Anacreon.

BARBOU, the name of a celebrated French family of printers, the descendants of John B. of Lyon, who lived in the 16th c. From his press issued the beautiful edition of the works of Clement Marot in 1539. His son, Hugh B., removed from Lyon to Limoges, where, among other works, his celebrated edition of *Cicero's Letters to Atticus* appeared in 1580. Joseph Gerard B., a descendant of the same family—who in the beginning of the 18th c. settled in Paris—continued in 1755 the series of Latin classics in duodecimo—rivals to the Elzevirs of an earlier date—which had been begun in 1743 by Coustelier, at the instigation of the learned Lenglet Dufresnoy. This series of classics, which is much prized for its elegance and correctness, was purchased, along with the rest of the business, by Delalain, from the heirs of Hugh B., who died in 1809. There is a complete set of the B. classics in the Royal Library of the British Museum.

BARBOUR, JOHN, an eminent Scottish poet of the 14th c., regarding whom history has not much to record beyond the production of the national epic, entitled *The Bruce*. Nothing is known of his parentage, and of his birth it can only be conjectured to have been about 1320. The ascertained facts of his life are few. We are informed only that in his own age he was accounted a man of great learning and worth; that he was Archdeacon of Aberdeen as early at least as 1357, and held that office till his death in 1395; that in 1357, he travelled into England, accompanied by three scholars, for the purpose of studying at Oxford; that he repeated his visit to England for purpose in 1364; that in 1365, he ob[tained] port 'to travel through England with [two] on horseback towards St Denis and [other] places;' that in 1368, he again received [permission] to travel through England with two servants [and] two horses, on his way for scholarly purposes [to] France; that in 1373 he was Clerk of Audi[t] the household of King Robert II., and one [of the] auditors of Exchequer; that in 1375, [the] poem was more than half finished; [and] he had a gratuity of ten pounds from [King Robert] II.; that in 1378, he received from the same prince a perpetual annuity of twenty shillings, which in 1380 he bequeathed to the dean and chapter of Aberdeen, under the condition that they should a yearly mass for the rest of his soul; that in 1381 he had a gift from the crown of the [wardship of] a minor, whose estate lay within the parish [where] he was rector; that in 1383, and [again] in 1388, was one of the auditors of Exchequer; that King Robert II. granted him a [pension] of ten pounds a year; and that he died between March 1394 and Whitsunday 1395, probably on [the] 13th March of the year last named, his anniversary [being] celebrated in the cathedral of Aberdeen being celebrated on [that] day until the Reformation. Besides *The Bruce*, B. wrote another poem, now lost, called *The Brut*, in which he recounted the origin and [early] history of the royal house of Stuart. *The Bruce* is [remarkable] by great purity and clearness of style, [considerable] and versification contrasting advantageously with those of any contemporary English poet, not excepting even Chaucer. His imagery is not rich, but [what] is seldom other than lively, simple, and energetic. Fortunate in the choice of a noble theme, he has depicted, in rough but faithful outlines, the manners, and deeds of a truly [great] given to his country, not only the [first] literature, but the earliest history of her [greatest] greatest king.—The best edition of *The Bruce* accessible to the public, is that of Dr James [Cumming] (Edin. 1820); but a superior one, under the care of Mr Cosmo Innes, was produced for the Spalding Club in 1856.

BARBU'DA, one of the British Caribbees, lies 30 miles to the north of Antigua. Of its [two] end, the lat. and long. are 17° 33' N., and 61° [48'] Its area is estimated at 75 square miles. [The] number of its inhabitants in 1871 was 8[000]; proportional density, therefore, of population [only] about ⅛ of that of Barbadoes (q. v.). In [1871] island, small as it is, has never been cleared [for] cultivation, the greater part of the interior [being] dense forest interspersed with patches of [scrub]. The agriculture, such as it is, is confined [to] rearing of stock and the growing of provisions. [The] is of coral formation, and is beset with reefs. [It has] a roadstead, but no harbour.

BA'RBY, a walled town of Prussia, on the left bank of the Elbe, 15 miles [N.] Magdeburg. It is well built, [and has some] Pop. 5212, chiefly engaged in the manufacture of woollens and linens.

BA'RCA, a country in the north of Africa, 26°—33° N., and long. 20°—25° E., lying [on] Great Syrtis (now called the Gulf of Sidra) [and] Egypt. It forms the eastern division of [Barbary], having the rest of that dominion on the Mediterranean Sea on the N., the Libyan Desert on the S., and it is separated from [Tripoli] E. by no definite line, but by a [tract] of independent tribes. It nearly corresponds [to] ancient Cyrenaica (q. v.). Population [is] estimated from 300,000 to 1,000,000.

ıy and agreeable in the more elevated parts, reach a height of about 1200 feet, and in exposed to the sea-breeze. There are none small streams, but the narrow terrace-like of country are extremely fertile, realising all s said of the ancient Cyrenaica. Rice, dates, saffron, &c., are produced in plenty. The es are excellent; the horses still celebrated, ancient times. But the good soil extends over about a fourth of B.: the east exhibits only rocks and loose sand. Many ruins in the western parts attest a former state of cultiva- much superior to the present. So early as the of Cyrus, B. became a state, which proved rous to the neighbouring state of Cyrene; but a single century it sank, and became subject pt. In the Roman period, its inhabitants oted for their predatory incursions. It was rards a province of the Greek empire, and had ed itself independent when the Arabs invaded onquered it in 641. The present inhabitants t of Arabs and Berbers, who profess the mmedan religion, and are subject to the Pacha ripoli, to whom each of the beys pays an l tribute.

BARCAROLLE, a species of song peculiar to ondoliers of Venice. The name is applied to al compositions for voice or pianoforte of a r character.

BARCELONA, the most important manufac- city in Spain, in the province of the same , is beautifully situated on the Mediterranean en the mouths of the Llobregat and the Besos, midst of a district as luxuriant as a garden. walled, and possessed of a citadel, which, how- is effectually commanded by the fortress of jouy on the south-west. B., like Edinburgh, ided into two parts—the old town and the new the *Rambla* (river-bed), which has been planted flowering shrubs, and formed into a beautiful nade. The streets of the old town, forming orth-west division, are crooked, narrow, and ved. Those of the new are much more spacious egular. There is a large suburb to the east of own, where the seafaring portion of the popula- chiefly reside. In 1861, the population was 0; but in 1865 it had been reduced to 167,095, y by a frightful cholera epidemic in 1865. B. see of a bishop. It has a university, and es and schools for general and special educa- purposes; public libraries, in one of which is a splendid collection of MSS.; several hos- and other charitable institutions; the finest re in Spain; and numerous ancient and elegant hes, with a cathedral which, began in 1298, is et completed. B. manufactures silk, woollens, n, lace, hats, firearms, &c., which form its ipal exports. It imports raw cotton, cotton, sugar, and other colonial produce; also Baltic r, salt-fish, hides, iron, wax, &c. Next to , it is the most important port in Spain. In- more vessels clear out of its port than out of ; but they are of smaller size, the entrance to harbour, which is itself commodious, bein active to large vessels. The number of vessels entered in 1868 was 5161, with a tonnage of 80 tons; cleared out 2887, with a tonnage of 93 tons; value of imports in 1864, 406,872,631 ; exports, 132,915,919 reals. B. is a place of antiquity, and associated with many historical s. Local tradition fixes the date of its founda- 400 years before the Romans; and it is said ve been refounded by Amilcar Barca, the father nnibal, from whom its ancient name, Barcino, lerived. An important city under the Romans, Goths, and Moors, B. in 878 became an independent sovereignty, under a Christian chief of its own, whose descendants continued to govern it, and to hold the title of Counts of Barcelona until the 12th c., when its ruler adopted the title of King of Aragon, to which kingdom it was annexed. During the middle ages, B. became a flourishing seaport, rivalled in the Mediterranean by Genoa only. To its commercial code, framed in the 13th c., much deference was paid by the whole of Europe; and it was at this time, says Ford in his *Handbook of Spain*, 'a city of commerce, conquest, and courtiers; of taste, learning, and luxury; and the Athens of the troubadour.' Columbus was received here in 1493 by Ferdinand and Isabella, after his discovery of America. In 1640, it appealed to France against the tyranny of Philip IV.; but it turned against that country in the war of the Spanish Succession, and adhered to Austria. In 1705, the fortress of Montjouy was surprised and captured by Lord Peterborough, and the city surrendered shortly afterwards. In 1714, after a most heroic defence, it was stormed by the Duke of Berwick, and given over to fire and sword. Napoleon perfidiously obtained possession of it in 1808; and with one or two reverses, and in the face of great difficulties, it was held by the French until the treaty of peace concluded in Paris in 1814. For thirteen years, B. remained quiet under the iron rule of España; but in 1827 its old turbulent spirit returned, and it rose in favour of Don Carlos. Since that time, B. has successively supported the pretensions of any party in the state whose ascendancy at the moment seemed to offer most advantages to itself.

BARCLAY, ALEXANDER, a poet and prose writer, born about the end of the 15th c., whether in England or Scotland is not certain. He studied at Oxford, and then obtained, through his patron, Bishop Cornish, an appointment as one of the priests or prebendaries of St Mary Ottery, in Devonshire. He afterwards became a monk of the Benedictine monastery of Ely, where he continued until its suppression in 1539. He died in June 1552, six weeks after he had been presented to the rectory of All-Hallows, London. His claim to notice rests chiefly upon his famous poem, *The Ship of Fools of the World*, partly a translation, and partly an imitation of the German *Narrenschiff* by Brandt—which was printed by Pynson in 1508, and since several times reprinted. It is interesting (as most satires are), as showing the manners and customs of the times satirised. He published several works besides; among others, *The Mirrour of Good Manners*, *The Castell of Labour*, *The Eclogues*, the first volumes that appeared in the English language; and also made a translation of Sallust's *History of the Jugurthine War*. In his lifetime, he was admired for his wit and eloquence, and his writings exhibit a refinement not common in that age.

BARCLAY, JOHN, a clever poet and satirist, was born about 1582, at Pont à Mousson in Lorraine, where his father, William B., a Scotsman, who died in 1605, had held the office of Professor of Law. He studied in the Jesuit College of that place; and the distinguished talents which he early displayed, caused the Jesuits to try to induce him to enter their order. On account of his rejection of their proposals, he, as well as his father, suffered much persecution. He accompanied his father to England in 1603, where he soon attracted the attention of James I., to whom he dedicated one of his works, *Euphormionis Satyricon* (Lond. 1603), a political-satirical romance, chiefly directed against the Jesuits. Next appeared his *Conspiratio Anglicana* (Lond. 1605), and his *Icon Animarum* (Lond. 1614). In

1615, he left England, and went to Rome, where he died August 12, 1621. In the same year his celebrated work *Argênis* appeared in Paris (Paris, 1621). It was written in Latin, and has been translated into several languages. There are no fewer than three translations into English; the last appeared in 1772. It is a political allegory, containing clever allusions to the state of Europe, more particularly of France, during the time of the League. *Argênis* was admired both by Cowper and D'Israeli.

BARCLAY, ROBERT, the celebrated apologist of the Quakers, was born on December 23, 1648, at Gordonstown in Morayshire, Scotland. His father was the son of David Barclay of Mathers, the representative of an old Scoto-Norman family, which traced itself through fifteen intervening generations to Walter de Berkeley, who acquired a settlement in Scotland about the middle of the 12th c.; his mother was the daughter of Sir Robert Gordon, the premier baronet of Nova Scotia, and historian of the House of Sutherland. Young B. received the rudiments of learning in his native country, and was afterwards sent to the Scotch College at Paris, of which his uncle was rector. Here he made rapid progress in his studies, and excited the admiration of his preceptors, as well as of his relative, who offered to make him his heir, if he would remain in France, and formally adopt the Roman Catholic religion, to the ceremonies of which he had been habituated during his residence there. This, however, B. refused to do; and in compliance with the wish which his mother had expressed on her death-bed, he returned home in 1664. Though only sixteen, B. was an excellent scholar, and could speak in the Latin language with wonderful fluency and correctness. In 1667, he embraced the principles of the Society of Friends, for reasons more highly respected in our day than in his. He states in his *Treatise on Universal Love*, that his 'first education fell among the strictest sort of Calvinists,' those of his country 'surpassing in the heat of zeal not only Geneva, from whence they derive their pedigree, but all the other so-called reformed churches;' that shortly afterwards, his transition to France had thrown him among the opposite 'sect of papists,' whom, after a time, he found to be no less deficient in charity than the other; and that, consequently, he had refrained from joining any, though he had listened to several. The ultimate effect of this was to liberalise his mind, by convincing him of the folly and wickedness of religious strife. In both Calvinists and Catholics, he found an absence of 'the principles of love,' 'a straitness of doctrine,' and a 'practice of persecution,' which offended his idea of Christianity, as well as his gentle and generous nature. He therefore allied himself gladly to this new sect, whose distinguishing feature was its charity and pure simplicity of Christian life, and soon became one of its most devoted adherents and its ablest advocate. In the course of his life, he made several excursions into England, Holland, and Germany, earnestly propagating his peaceful views wherever he went, and occasionally enjoying the companionship of William Penn. His first publication was *Truth Cleared of Calumnies*. It appeared in 1670, and was intended as a refutation of the charges—many of them notoriously false—made against the new sect. In 1673 appeared *A Catechism and Confession of Faith*, the answers to the questions being 'to avoid theological dogmatism in the words of Scripture. This was followed by *The Anarchy of the Ranters*, &c. In 1675, he published his *magnum opus*, elaborately entitled *An Apology for the True Christian Divinity, as the same is held forth and Preached by the People called in scorn Quakers: Being a full Explanation*, &c. It contains a statement and defence of fifteen religious propositions peculiar to the Friends. The leading doctrine which runs through the whole book is, that divine truth is made known to us not by logical investigation, but by intuition or immediate revelation; and that the faculty, if it can be technically defined, by which such intuition is rendered possible, is the 'internal light,' the source of which is God, or, more properly, Christ, 'who is the light that lighteth every man that cometh into the world.' The identity of this doctrine with that held by Mr Maurice and others of the Broad Church in the present day has been more than once remarked. In 1677 appeared his *Treatise on Universal Love*. It was the first of that long series of noble and gentle remonstrances against the criminality of war that has so honourably distinguished the Society of Friends. It was addressed to the ambassadors of the several princes of Europe, met at Nimeguen. In 1686, he published his last work, which was a defence of the doctrine of 'immediate revelation.' He died at Ury, in Kincardineshire, October 3, 1690. His estate remained in the possession of his descendants till 1854, its owner at that time being Captain Barclay, the famous pedestrian. 'The Apologist's Study,' which remained much as he left it, was long an object of pilgrimage with members of the Society of Friends; it was destroyed a few years ago, when the old house of Ury was pulled down.

BARCLAY DE TOLLY, MICHAEL, PRINCE, one of the most distinguished Russian generals, was descended from a branch of the same Scotch family to which the two preceding—Barclay the poet, and the apologist of the Quakers—belonged, some of whom had settled in Mecklenburg and Livonia. He was the youngest of three brothers, and was born in 1759 in Livonia, where his father, Gottlieb B. de T.—at one time a member of the town-council of Riga—possessed an estate. Having been adopted by General van Vermoulen, B. de T. entered a Russian regiment of cuirassiers, at first with the rank of sergeant. He fought with great bravery in the Turkish war of 1788—1789; in the campaign against Sweden in 1790; and in those against Poland in 1792 and 1794. In the year 1806, at Pultusk, as major-general, he commanded Benningsen's advanced-guard. He lost an arm at the battle of Eylau. Although much hated by the Russian national party, because regarded by them as a German, he was appointed minister of war by the Emperor Alexander in 1810—an office which he held till 1813. In 1812, he was made commander-in-chief of the army of the west. His retreat to Smolensko, and the loss of the battle fought there on the 17th of August, raised the hatred of the Russian national party to a greater height than ever, and he was obliged to yield the chief command to Kutusow. It has been maintained by many, that B. de T. was the originator of the Russian system of defence in 1812. He had indeed advised a retreat to the interior, and recommended the avoidance of a battle; but the system of defence, as a whole, originated with General Pfuel, who had left the Prussian service, and constantly accompanied the Emperor Alexander from the year 1807, without holding any distinct official appointment. At Moskwa, B. de T. commanded the right wing. After the death of Kutusow, he again obtained the chief command of the army, which he held at the battle of Bautzen, and retained till the truce. He afterwards commanded the Russian army in Bohemia, and took part in the battles of Dresden, Culm, and Leipsic. He was commander-in-chief of the Russian army in France, and in consequence of this was made a prince and a field-marshal. He died in 1818 at Insterburg, on his way to the Bohemian

Two or three years before his death, the
of Tolly or Towie, in Aberdeenshire, the old
itance of his family, was for sale, and he was
ed to buy it, but refused, on the ground that
mily had been so long expatriated that Scot-
was now to them a strange country.

ARCLAY AND PERKINS' BREWERY,
f the largest establishments of the kind in the
l, is situated in Park Street, Southwark, Lon-
the buildings covering upwards of ten acres.
brewery was founded by Dr Johnson's friend,
y Thrale, who, in 1773, according to a state-
made by the doctor on his Hebridean tour, was
g as much as £20,000 annually to the Excise.
Thrale's death, it was sold by the executors to
ay (a descendant of the author of the *Apology
e Quakers*) and Perkins, who had been Thrale's
clerk, for £135,000. So far back as the year
when described in Dodd's *Visits to Factories*,
at establishment had 24 malt-lofts, each as
a three-storied house; a brewing-room
as large as Westminster Hall; 10 coppers
g 120,000 gallons capacity each; 4 ferment-
els of 1500 barrels capacity each; a cooling-
of 1000 square yards area; 300 yeast-working
s of 300 gallons capacity each; and 150 store-
one large enough to contain 100,000 gallons.
perations consumed 2000 quarters of malt and
0 gallons of water weekly; while the convey-
of the beer to the public-houses employed 200
and drays. All these quantities have increased
; for although there has been a vast increase of
ation between 1841 and 1871, the number
rter breweries in the metropolis (of which
of Barclay and Perkins, and Truman and
ury, are the chief) remains nearly uniform.

R-CO'CHBA, SIMON, the leader of the Jews in
great insurrection against the Romans, under
mperor Hadrian, from 131–135 A.D. Three
had the oppressed Jews revolted without suc-
rom 115 to 118; and in 130, soon after Hadrian's
from Syria, a new rebellion broke out, for
they had been secretly preparing. At the
of it was one Simon, who assumed the name
r-cochba, i.e., 'Son of the Star,' pretending
he prophecy was to be fulfilled in him, 'There
come a Star out of Jacob' (Numb. xxiv. 17).
ught at first with great success against the
ns, and even obliged them to evacuate Jeru-
where he was proclaimed king, and caused
to be struck with his name. The war spread
ll the country of Palestine, and fifty towns,
s many villages and hamlets, came into the pos-
of the Jews. But on the arrival of Hadrian's
l, Julius Severus, Jerusalem was retaken; and
gust 135, Bether, the very last strong fortress
y the Jews, was stormed by the Romans. B.
the day of this bloody conquest. During the
undreds of thousands of Jews were destroyed,
were executed, and very cruel edicts were
uently issued against them. From this last
le dates the final dispersion of the Jews over
e of the earth. The Holy City was razed to
und, and rebuilt under another name. The
I retain in their liturgy hymns which they
mournful memory of this tragic event.

*diache Krieg unter den Kaisern Trajan und
en* (Altona, 1821).

RD, the name, known to the Romans since
c., by which the Gauls and other Celtic
s (British, Welsh, Irish, and Scotch) desig-
their minstrels. Like the Scôps of the Anglo-
, and the Skalds of Scandinavia, the bards
ted the deeds of gods and heroes at religious
solemnities, and the festivities of princes and nobles, accompanying their recitations with the harp or chrotta (Ir. *cruit* and *clarsach*); they excited the armies to bravery, preceded them into the fight, and formed the heralds of princes, and the mediators of peace. The institution early disappeared among the Gauls, but lingered long in Wales, Ireland, and Scotland. The bards formed a hereditary order, and exercised a decided national influence. The minstrels among the Celts, as among the Germans, were the organ of the people, and the channel of all historical tradition. It is supposed that in Wales, about 940 A.D., their privileges were defined and fixed by the laws which bear the name of King Howel Dha; and in 1078 the whole order is said to have been reformed and regulated anew by Gryffith ap Conan. At Caerwys, Aberfraw, and Mathraval, there were held from time to time great competitions in minstrelsy, called Eisteddfods, at which the judges were appointed by the prince. When Wales was conquered by Edward I. (1284), the bards lost their privileges, and were, according to tradition, persecuted and put to death; but succeeding princes countenanced the institution, and Eisteddfods were repeatedly held under royal commission down to the reign of Elizabeth. Since then, exertions for the revival of national Welsh poetry and the bardic profession have been made by several societies: the Gwyneddigion, founded in 1770; the Cambrian, in 1818; and more recently, the Metropolitan Cambrian Institution. To these societies, and to the patriotism of individuals, we owe collections of the relics of the lays of the Welsh bards, none of which, it should be added, can be traced to MSS. of an older date than the 12th c. The most interesting of those relics are those of Liwarc'h-Henn, Aneurin, and Taliesin. See Jones's *Relics of the Welsh Bards* (Lond. 1794); Owen's *Myvyrian Archæology of Wales* (3 vols., Lond. 1801–1807); *Poëmes des Bardes Bretons du vie Siècle, par T. H. de la Villemarque* (Paris, 1850), &c.

In Ireland, the bards are believed to have been a hereditary guild, divided into three classes: the Filedha, who sung in the service of religion, and in war, and were the counsellors and heralds of princes; the Braitheamhain, who recited or chanted the laws; the Seanachaidhe, who were chroniclers and genealogists to princes and nobles. Their ample privileges and endowments of land gave them an exorbitant influence, which both princes and people had sometimes to rise against and curb. The great skill of the Irish bards on the harp was acknowledged everywhere. After the conquest of Ireland by Henry II., the profession began to sink. Still many of the chiefs maintained bards in their families, whose songs and legends kept up the national feeling. This occasioned several measures of the English rulers against the Irish bards; Elizabeth ordered the bards that were captured to be hanged, as the instigators of rebellion. Turlogh O'Carolan, born 1670, died 1737, is reckoned the last Irish bard; his poems were translated into English by Furlory. Other lays of the bards have been translated by Miss Brooke, *Relics of Irish Poetry* (Dub. 1789), and Hardiman, *Irish Minstrelsy* (Dub. 1831).

The bardism of Scotland may be conjectured to have been similar to that of Ireland; but nothing is certainly known of the subject beyond the fact, that there were poets or bards, of different degrees, in the Highlands down to the 17th c.

The name of B. was unknown among the Germanic nations; though a corrupt reading in some MSS. of the *Germania* of Tacitus (*barditus* for *baritus*, the 'war-cry') led Klopstock and others to write wild religious and war songs, which they called

They [illegible] formally separated themselves from the [illegible] church, though they continued to exist as late as the 5th c. See Hahn's *De Gnosticis Syris commentatio Historica et critica* (Lesp. 1819).

BARDOLINO, a town of Northern Italy, with a harbour on Lake Garda, and about 14 miles west from the fortress of Verona. The battle of Rivoli was fought in its vicinity in January 1797.

BAREFOOTED (Lat. *discalceati*, i.e., shoeless), an appellation given to certain monks and nuns who abstain from wearing any covering on the feet, either entirely (as the Alcantarines, who originated at Placentia, in Spain, in 1540, but who are chiefly found at present in the kingdom of Naples), or for a specified period of the year (as the nuns of our Lady of Calvary); or who, instead of shoes, wear merely sandals, i.e., soles of wood, leather, rope, or straw fastened by thongs. They do not constitute a separate order in the Roman Catholic Church, but are to be found as a higher grade of asceticism with more or less severity of observance, among most of the orders, Carmelites, Franciscans, Augustines, Eremites, Capuchins, &c. They are, however, steadily ignored by the more dignified Dominicans, though the latter are themselves mendicant friars. The origin of this form of religious austerity is to be traced generally to the custom which prevailed among the Jews and Romans of putting off their shoes on the occurrence of public calamities, that in this condition of mourning and humiliation they might implore the divine Being for deliverance; but perhaps more particularly to the command which Christ gave his disciples (Matt. x. 10; Luke x. 4).

BARÈGES, a small watering-place in France, situated in the Pyrenees, about 18 miles from Bagneres de Bigorre. The mineral water for which it is celebrated contains principally sulphuret of sodium, with portions of carbonate, muriate, and sulphate of soda, nitrogen, and sulphuretted hydrogen. Its efficacy in the cure of wounds, rheumatism, stiffness of joints, and scrofulous complaints is said to be very remarkable. See Murray's *Hand-Book to France*.

BAREGES, mixed tissues adapted for women's dresses, called in France *Crêpe de Barèges*. The name is derived from the place noticed in the above article; in reality, however, B. were never made in that little watering-place, the seat of the manufacture being at Bagnères de Bigorre. B. are usually a mixture of silk and worsted; an inferior kind being composed of cotton and worsted. They vary in colour, and are sometimes light in tint, with printed patterns. All are of a slight fabric for summer wear. The best are still manufactured in France.

BAREGINE. Many Algæ are found growing in mineral springs, especially those of a sulphurous nature. The product of their growth is a mucus-like substance somewhat resembling the white of an egg. This deposit is particularly abundant in the hot springs at Barèges, whence the name of baregine. It imparts a flesh-broth flavour and odour to the water, which is prized, and is sometimes imitated by adding animal gelatine to the sulphur-baths where B. is deficient.

BAREILLY, the chief city of a district of the same name in Rohilcund, British India—a district which, with an area of 3023 square miles, contains 1872 1,060,801 inhabitants, and which is bounded on the S. by Oude and Nepaul. The city itself, with an estimated population of 105,649 (1872), is in lat. 28° 23' N., and long. 79° 28' E., being 788 miles to the north-west of Calcutta, and 152 miles to the east of Delhi. It is pleasantly situated in a well-wooded country on the left bank of the Jooa, an affluent of the western Ramgunga. Besides a brisk and lucrative commerce, it has considerable manufactures, more particularly in the article of ornamental chairs and tables. B. became a name of notoriety in the great mutiny of 1857. On the 31st of May, the city was a scene of rapine and bloodshed. The native garrison, without any European troops to overawe them, rose against their officers, and seized the public treasure. They murdered every European who had not the means of escaping. But fortunately, from a suspicion of the outbreak, the ladies and children of the Company's servants, both civil and military, had been sent off in safety to Nynee Tal, in the Himalaya. B. was recovered by Sir Colin Campbell, afterwards Lord Clyde, in the May of the following year.

BARE POLES. When a ship has all her sails furled, she is said to be 'under bare poles.'

BARÈRE DE VIEUZAC, BERTRAND, a member of the French National Convention, born at Tarbes, 10th September 1755. He became an advocate at the court at Toulouse. After acting as a deputy in the National Assembly, the department of the Hautes-Pyrénées elected him to the National Convention in 1792. He is said to have been naturally in favour of moderate measures, but he was easily overawed by the influence of the party of the Mountain, with whom he generally acted, and whom he supported by his eloquence, which was so flowery and poetical in style that he came to be designated the Anacreon of the guillotine. He

was president of the Convention when the sentence was passed upon Louis XVI. He rejected the appeal to the people, and gave his vote with these words: 'The law is for death, and I am here only as the organ of the law.' His natural mildness warring with the instinct of self-preservation, made him alternately a supporter of merciful measures and an advocate of the guillotine, and his whole public conduct betokens a man much more selfish than patriotic or humane. After the death of Robespierre, in which he had concurred, B. nevertheless proposed the continuation of the Revolutionary Tribunal, for which he was denounced by Lecointre, and afterwards impeached and sentenced to transportation; his sentence, however, was not carried into effect, and he partook of the general amnesty of the 18th Brumaire. He was elected as a deputy to the Chamber in 1815, during the Hundred Days. After the second restoration, he was banished from France, and went to Brussels, where he devoted himself to literary work till the revolution of July permitted his return. In the year 1832, he was once more elected as a deputy by the department of the Hautes-Pyrénées; his election, however, was annulled, on account of errors of form, whereupon the government called him to be a member of the administration of that department, which office he continued to hold till 1840. He died on 14th January 1841. He bestowed upon the younger Carnot his *Mémoires*, which have been published (2 vols., Par. 1842). His many other political and historical writings are now of no importance.

BARETTI, Joseph, an Italian writer, born at Turin, 1716. He was intended for the law, but devoted himself to literature. In 1751, he established himself as a teacher of Italian in London, where, in 1757, he published the *Italian Library*, giving an account of the most eminent Italian authors and their works. He was about this time appointed secretary for the foreign correspondence of the Royal Academy. In 1762, he published an account of his travels through Portugal, Spain, and the south of France to Italy in *Lettere Famigliari*, which, with additions and a new title, were afterwards republished in England. B. now lived some time in Italy, and published at Venice a journal called the *Literary Scourge*, which brought upon him many prosecutions. On his return to England, he published, among other works, an Italian grammar, and an Italian and English dictionary, which have since gone through many editions. One evening, he became involved in a street-brawl in London, and stabbed with his penknife a man, who died soon after. B. was tried for murder, made his own defence, and was acquitted—Dr Johnson, Burke, and Garrick testifying to the excellence of his character. He died in 1789 in London.

BARFLEUR, a seaport town of France, in the department of La Manche, about 15 miles east of Cherbourg. It is now a place of little importance, but it is noteworthy as being the port from whence, according to report, William the Conqueror set out on his invasion of England. In the 13th and 14th centuries, B. was twice pillaged by the English.

BARGAIN AND SALE, in the law of England, is a mode of conveyance whereby property, real and personal, may be assigned or transferred for valuable consideration. It finds a chief place, however, in law-books in connection with the conveyance of real estate. In regard to personal estate, *assignment* (q. v.) appears to be the more appropriate, as it is the more usual term. B. and S., then, may be described as a conveyance, in the way of a real contract, by means of which property in lands and tenements, whether that property be in possession, remainder, or reversion, is conveyed from one person to another. In its terms, it consists of a B. and S. by the seller to the intended vendee for money; and by the statute of frauds, 29 Chas. II. c. 3, it must be in *writing;* and by the statute of enrolments, the 27 Hen. VIII. c. 16, it cannot pass a freehold, unless it be by *indenture enrolled* within six months after its date, or with a *custos rotulorum* of the county. But hereditaments lying within any city or town corporate, the officers of which have authority to make enrolment of deeds, are excepted from this statute. A B. and S. for a term of years, however, will be effectual without enrolment. But see Lease and Release.

No particular form of words is essential to the validity of a B. and S.; 'bargain and sell' are the words of transfer ordinarily used. But other words will have the same effect, and the distinctive character of the conveyance is determined by the consideration on which it is founded. This consideration, however, is held to be a mere matter of form, and sufficiently complied with if the conveyance purport to be so founded. To this end, any trivial sum may be inserted in the conveyance, though the consideration which really passes between the parties be of larger amount; or even though it be, in fact, not of a pecuniary nature. It is also immaterial whether the sum so inserted be actually paid or not.—Stephen's *Commentaries*, vol. i., pp. 535—537. See Custos Rotulorum, Possession of Property, Remainder, Reversion, Indenture, Lease, and Release.

There is no such title to land or other real estate in the Scotch law, but in that system there may be a *bargain* as to land, the evidence of which must be in writing, the Scotch law in this respect agreeing with the regulations of the English statute of frauds above referred to. The term bargain is also used by Scotch lawyers to signify a contract or agreement for the sale of personal or movable property, and to such a bargain the intervention of writing is not necessary, but it may be proved by witnesses.

BARGE, an ancient town of Piedmont, in the province of Saluzzo, 30 miles south-west of Turin. Pop. 9191, who are engaged in the manufacture of firearms and the quarrying of slate. A brisk general trade is also carried on.

BARGE. Various forms of vessel receive this appellation. The Admiralty and city of London

Barge—Royal.

barges, used on ceremonial occasions, are elegantly fitted out, and supplied with accommodation for many rowers. The B. belonging to a man-of-war, for the occasional use of the superior officers, is a well-trimmed, though not showy boat, light enough to be easily hoisted in and out of the ship. On our rivers and canals, a B. is a clumsy, flat-bottomed vessel of burden, employed either in conveying goods from one town or quay to

another, or to aid in bringing stores to and from ships. There are several kinds of this last-named craft—namely, coal-barges, sand-barges, west-country

Barge—Common.

barges, &c. For the chief points of difference between barges and other boats, see BOAT.

BA'RGE-BOARD. Where the roof, in Gothic houses, extends over the wall, the gable is generally furnished with a board, which either covers the

Barge-board.

rafter, or occupies the place of a rafter itself. These barge-boards were often very richly ornamented, particularly in the 14th and 15th centuries. The accompanying illustration is copied from Parker's *Glossary of Architecture*.

BA'RI (ancient *Barium*), a city in the kingdom of Italy, capital of a province of the same name, is situated on a peninsula in the Adriatic, in lat. 41° 8' N., and long. 16° 53' E., and about 140 miles N.N.E. from Naples. Pop. (1872) 50,524. It is strongly fortified, and defended by a massive old castle of Norman origin, nearly a mile in circumference. The city is divided into the old town and the new. The streets, with some few exceptions, are confined and gloomy. B., which is the see of an archbishop, has manufactories of cotton, silk, linen, soap, &c., and carries on an active export-trade in oil, corn, and fruit with Trieste and Dalmatia. Its harbour does not admit of the entrance of large vessels; but its quay and roadstead are good. It has some fine ecclesiastical structures, the most notable of which is the priory of St Nicholas, a noble specimen of the Lombard style of architecture, founded in 1087, and liberally endowed by the brothers Guiscard. Within the walls of this building, Urban II., in 1098, held a council of Greek and Latin bishops, with the view of settling the differences between the two churches; and Roger II. was here crowned king of Sicily. The priory contains some interesting monuments and relics, the most remarkable of which is the tomb of Bona Sforza, queen of Poland, who died in the castle in 1557. B. is one of the cities believed to have been founded by Iapyx, son of Dædalus. Its coins shew it to have been a place of considerable note among the Greeks as early as the 3d c. B.C. The Romans appear to have held it in but little repute; but it rose in esteem when, in the 10th c., it fell into the hands of the Greek emperors, who made it the capital of Apulia, and the residence of a viceroy. It was twice taken in the 11th c. by the Normans, who added to its strength and importance.

BARIGA'ZZO, a village of Modena, province of Lunigiana, remarkable for the streams of fire which issue out of the soil to a height of several feet, and which continue to burn for days without intermission.

BARI'LLA, an impure carbonate of soda, procured from plants which grow in salt-marshes or other places near the sea, and which forms a considerable article of commerce, being used in the manufacture of soap and of glass, and for other purposes in the arts. The greatest quantities of B. are produced in Spain and the Balearic Islands; but the Canary Islands, Italy, and France, also contribute a part. It is procured by burning the plants, much in the same way that sea-weeds are burned upon the coasts of Scotland to procure kelp. The Spanish B. is most esteemed, especially that produced near Alicante, which is chiefly obtained from the *Salsola sativa*, a plant of the natural order *Chenopodiaceæ*. This plant is there cultivated in grounds close by the sea, embanked on the side nearest it, and furnished with floodgates, through which the salt water is occasionally admitted. It is cut in September, dried in small heaps, and then burned in a hole in the ground. The exportation of the seed is prohibited by the Spanish government under the severest penalties. Other species of *Salsola* (Salt-wort), as *S. Tragus* and *S. Kali* (the latter, a common native of the shores of Britain), are also burned for B., although they yield it in smaller quantity than *S. sativa*. B. is made in France from *Salicornia herbacea* or *annua* (Glass-wort), another of the *Chenopodiaceæ*, plentiful also in salt-marshes on the shores of Britain and other parts of Europe. See SALT-WORT.

BA'RING. The firm of Baring Brothers is one of the greatest commercial houses in the world. Its founder was John B., a German, who settled in a small business in Exeter, England, in the first half of the 18th c. Two of his sons, Francis and John, established in London in 1770 the now existing house.

FRANCIS became a director of the East India Company, and being a stanch supporter of Pitt, was created a baronet by that minister in 1793. He took an active part in the discussions relative to the Bank Restriction Act of 1797.

SIR THOMAS B., eldest son of the above, born June 12, 1772, succeeded his father in the baronetcy. He appears to have taken no active part in the business of the firm, being chiefly remarkable as an admirer and encourager of art. His magnificent

…stion of paintings was dispersed by public …r his death in April 1848.

ALEXANDER B., brother of the above. See LORD ASHBURTON.

SIR FRANCIS THORNHILL B., son of Sir Thomas, whom he succeeded, was born in 1790, was educated at Oxford, where in 1817 he took a double first class. He entered parliament as M.P. for Portsmouth in 1826. Under successive Whig governments, he held the offices of a Lord of the Treasury, Secretary to the Treasury, Chancellor of the Exchequer, and First Lord of the Admiralty. He was more noted for his business aptitude than as a politician. He died September 1866.

THOMAS B., brother of the above, born in 1800, devoted himself early to commercial pursuits, and also to politics, taking the opposite side to his brother. He was, however, much more widely …wn as a partner of the firm of B. Brothers than …politician. He died in November 1873

…he firm is engaged to a large extent in the negotiation of national loans, in exchange and money broking, in the produce-trade, home and colonial, in importation and exportation upon their own foreign accounts, &c.

BARITAH (*Barita*), a genus of large Australian birds, placed by some ornithologists in the family of Shrikes (q. v.), (*Laniadæ*), and by others in that of Crows (q. v.), (*Corvidæ*). The bill is large, conical, scarcely curved, the base of it extending remarkably backward on the forehead. The best known species is the Piping Crow, or Piping Grakle, or Jar-ra-warnang of New South Wales (*B. Tibicen*). It preys on small birds, is gregarious, assembling in small flocks, has a melodious voice, is easily tamed, and becomes very familiar and amusing, learns to whistle tunes extremely well, and exhibits a great power of mimicking the voices of other birds.

BARIUM is the metal present in heavy spar (sulphate of baryta) and baryta. Till lately, it was regarded as a white metal, but the recent researches of Dr Matthiessen have demonstrated that it possesses a yellow colour. As yet, the metal B. has not been obtained in mass, but only as a powder. It decomposes water readily at ordinary temperatures, and exposed to the air, quickly combines with oxygen, forming the *oxide of B.* (BaO), or BARYTA. The latter substance is an earth resembling ordinary caustic lime, and may otherwise be prepared by adding finely divided black oxide of copper (CuO) to a solution of sulphuret of B. (BaS), when the sulphuret of copper (CuS) is thrown down, and the baryta (BaO) is left in solution. On evaporation, the water of solution passes off as steam, and leaves the solid earthy-looking substance, baryta. A third mode of preparing baryta is to heat strongly the nitrate of baryta ($BaONO_5$), when the nitric acid (NO_5) flies off, and leaves the baryta (BaO). The *sulphuret of B.* (BaS) is obtained when the sulphate of baryta ($BaOSO_3$) in powder is mixed with finely-pulverised coal, and the whole being placed in a crucible, is raised to a red heat in a furnace. The result is, that 4 atoms of the …on (C) of the coal carry off the 4 atoms of …gen in the sulphate of baryta as carbonic oxide …), whilst the B. united solely with sulphur is … behind as the sulphuret of B. (BaS). The *…ride of B.* is prepared by adding hydrochloric … (HCl) to a solution of the sulphuret of B. … when hydrosulphuric acid (HS) escapes, and …ide of B. remains behind, and on evaporation … liquid, is obtained in crystals.

…RK. See BANQUE.

…RK (*cortex*), in phanerogamous or flowering … the external covering of the stem. It is composed of layers of cellular tissue, whilst the woody stem, to which it forms a sort of sheath, is vascular. In endogenous plants (palms, &c.), there is not, in general, a very marked line of separation between the B. and the vessels or vascular bundles of the stem, so that these plants are generally, but incorrectly, said to have no bark. It is in exogenous plants, and especially in perennial woody stems, that the development of B. is most perfect, and the distinction between wood and B. most marked. The outermost layer of the B. of exogenous plants is the *epidermis* (q. v.), which, however, is in general only to be seen in annual stems, and in the youngest parts of woody stems; peeling off as the stem becomes older along with the outer layers of the true bark. Beneath the epidermis is the true B., of which the outer layer is called the *epiphlœum* (Gr. outer bark), and consists of cells, usually rectangular and flattened, with thick walls. The inner layer of the true B. is called the *mesophlœum* (Gr. middle bark), and is generally formed of a cellular tissue of roundish cells with thin walls. These layers are sometimes very distinctly separated from one another, and sometimes pass gradually into one another; sometimes there is merely a continuous cellular tissue. Within the true B. is a very distinct layer, the inner B., *liber* (Lat.) or *endophlœum* (Gr. inner bark), also frequently called Bast, which is composed of bundles of woody fibre or vascular tissue mixed with cellular tissue. The layer of Cambium (q. v.) is often regarded as belonging to the inner B., but rather belongs to the vascular part of the stem. In the inner B. are sometimes found cells containing a milky juice, as in the *Apocynaceæ*, or vessels for a milky juice, as in the common fig. The combined strength and flexibility of the fibres of the inner B. render it in many cases useful for various purposes. See FIBRE and BAST. In the true B., the peculiar juices and most characteristic substances elaborated by the plant are very generally found, for which reason that part is often of the greatest importance in medicine and the arts. The B. of many trees abounds in *Tannin* (q. v.) or *tannic acid*

The B. of a stem or branch of not more than one year old exhibits only a cellular integument or epidermis with an interior lining of woody fibre—the inner B.; but new layers are added from year to year, the B. as well as the woody stem being increased from the cambium, the mucilaginous layer which is interposed between them, and which particularly abounds in spring, when the separation of the B. from the stem is most easy. The annual layers, however, cannot long be distinctly recognised in the B. as in the wood; and in the older portions of woody stems, the outermost parts of the B. become desiccated and lifeless, and are in general gradually thrown off. On this account, those mosses, lichens, and other plants which attach themselves only to the outermost layer of the B. of trees, and derive their nourishment from it, cannot be regarded as true parasites, as they are in no degree supported by the juices of the stem, but only consume and remove external matter already destitute of life. The B. of some trees is remarkable for the thickness which it acquires, as that of the cork-tree, in which the *epiphlœum* is formed of many layers of cells. The outer parts of thick barks very often crack, to admit of the expansion of the stem within; in the lace-bark tree of the West Indies, the fibres of the inner B. become partially separated as it is distended, forming lozenge-shaped meshes arranged with beautiful regularity.

The connection between the cellular tissue of the B. and that of the pith in the centre of the … continually maintained by means, in

stems, of the medullary rays. See EXOGENOUS PLANTS and PITH. The B. is a protection to the young and tender wood; it appears also to exercise functions analogous to those of the leaves, which, when young, it resembles in its colour, and which are regarded as dilatations of it, so that it has been called the 'universal leaf' of a plant.

BARK, in Medicine, &c. The principal barks used in medicine will be found noticed in separate articles. See ANDIRA (*Cabbage B., Surinam B.*); ANGOSTURA B.; CARIBBEE B. (*Jamaica B., St Lucia B., Piton B.*); CASCARILLA (*Cascarilla B., Eleutheria B.*); CINCHONA (*Cinchona B., Peruvian B., Jesuits' B.*, China, Cascarilla, *Arica B., Calasaya B., Carabaya B., Huamalies B., Huanuco B., Jaen B., Loxa B., Maracaibo B., Ash B., Crown B., Silver B., Yellow B., Tan B.*, &c.); CLOVE B.; COPALCHE B.; CULILAWAN B.; WINTER'S BARK.—When B. is mentioned without any prefix, it is always Cinchona, otherwise called Peruvian or Jesuits' B., which is intended.

The barks used for dyeing, tanning, and other purposes in the arts, being generally named from the trees which produce them, particular references here are unnecessary.

BARK, FOR TANNING. The B. of many trees is capable of being used for tanning (q. v.), but those kinds of B. are preferred which particularly abound in tannic acid. Oak B. is principally used in Britain, and throughout Europe; also in North America, although that of America is obtained from species of oak different from the European; in Spain, the inner layer of the B. of the cork oak, or cork-tree, is employed, and it is to some extent imported into Britain for the use of tanners. The B. of the chestnut is also much esteemed. Larch B. and willow B. are used in preparing some kinds of leather. The B. of the birch and that of the alder are also employed; birch B. being, however, more esteemed for steeping fishermen's nets and cordage, to preserve them from rotting, than for the preparation of leather. Different species of *Acacia* (q. v.) and of *Eucalyptus* (q. v.) furnish barks used for tanning in Australia, some of which have, to a small extent, become articles of commerce.

The *barking* of trees can be accomplished with facility only in spring, when the sap has begun to circulate. The tree being felled, the rough external lifeless parts of the B. are removed as useless, by means of a sharp instrument called a *scraper;* the smaller branches are cut into lengths of about two feet, and their B. is loosened by beating with a mallet, and easily taken off—as boys at the same season make plane-tree whistles; the B. of the trunk and main branches is cut through by a chisel-like instrument, called a *barking-iron*, into similar lengths, each of which is divided longitudinally, and finally stripped off by the aid of mallets, chisels, &c. The B. is sometimes dried in sheds, being placed on narrow shelves or frames in such a way that there may be a very free circulation of air about it; sometimes in the open air, when it is very generally made to rest in a sloping position against trunks of trees placed horizontally at a little distance from the ground, the larger pieces of B. being placed so as to protect the smaller both from sun and rain. Great care is necessary in the drying of B., as it is much spoiled if allowed to get mouldy, and is liable to suffer injury from rain or from the exposure of its inner surface to the sun.—Oak and birch B. are usually about equal in their price, which, however, varies very much, from £4 to £8 per ton. Larch B. is much less valuable; it is also of much greater bulk in proportion to its weight. The B. is a very important source of the revenue derived from many woods and coppices.

BARK BEETLE, or BARK-CHAFER, a common to many of the large family of Coleo ous Insects (q. v.), called by entomologists *Xylop* (Gr. wood-eaters). They are all small, and general of uniform colour; they have hard bodies, a short, often club-shaped antennæ. Most of t family live in wood or other vegetable substanc as mushrooms, dried plants in herbariums, &c., a some of them are extremely injurious to livi trees. Those called B. beetles or bark-chafers bo holes in the bark, and deposit their eggs in inner bark, in which the larvæ excavate paths often causing the death of the tree. One speci particular, sometimes called the common Bark- (*Tomicus typographus*), and sometimes the T rapher Beetle, from the figure of its burrows,

Tomicus typographus.

a, natural size; *b*, insect magnified; *c*, galleries made by the insect.

from time to time appeared in extraordin bers, ravaging the forests of Germany. In caused the death of a million and a half of p the Harz Forest alone. This insect is mentione some of the old German liturgies under the pop name of 'the Turk,' which its dreaded ra obtained for it.

BA'RKAL, or JE'BEL BA'RKAL, a s sandstone rock in Nubia, situated in lat. 18° and long. 31° 46' E., about a mile from the righ of the Nile. It is quite isolated, perpendicular o side facing the river, and very steep on all. It two miles in circumference at the base, and in height, its summit forming a pretty broad p Between it and the river are the remains of magnificent temples, the two principal one known as the Typhonium, and the Great one of the largest monumental ruins of The ancient city of Napata is supposed to situated in the vicinity. The two red gra now in the Egyptian Room of the British were brought from B. in 1832 by Lord P

BA'RKER, EDMUND HENRY, a lish philologist, was born 22d Hollym, in Yorkshire, and studied Besides editions of several Latin c rous contributions to periodicals, *Classical Journal*, he was led,

the famous philologist Parr, to undertake a ion of Stephens's *Thesaurus Linguæ Græcæ*. gigantic work was violently assailed in the *rterly Review* by Blomfield, against whom B. e his *Aristarchus Anti-Blomfieldianus* (Lond.); yet he and his publisher, Valpy of London, ed it on and completed it in a spirited man- (13 vols., 1816–1828). In 1812 appeared the volume of his *Classical Recreations*. He also ded materials for the composition of Sturtz's *xilogicum Gudianum*. He likewise translated works of German philologists, among others, mann's *Greek Grammar for Schools*. He col- d the mass of anecdote and criticism relative his friend Dr Parr, which was published in n, in 1828–1829, under the title of *Parriana*, rk well-nigh unreadable, from the superabund- and ill-digested nature of its matter. He assisted Professor Dunbar in the compilation he Greek and English Lexicon published in . He lost all that he had in a lawsuit about a able inheritance, so that he was obliged to sell ine library, and was put into the debtors' prison. died in London, March 21, 1839, in extreme rty.

A'RKER, JOHN, descended of an English mer- ile family, became, in 1799, agent for the East a Company at Aleppo; in 1826, British consul at xandria; and afterwards consul-general in Egypt. he year 1834, he removed from this situation he lonely but lovely valley of Suedia on the ea. 4 leagues from Antioch, where he employed the cultivation of the choicest fruits of Europe. We are indebted to him for Hanwick Nectarine, the most delicious yet oduced into our gardens. The good terms on h he stood with the people around him and the government, enabled him to render many able services to European travellers. He died xedia on the 5th of October 1850.

A'RKER'S MILL (Fr. *Roue à réaction*, Ger. *er's Wasserrad*), a water-wheel invented by

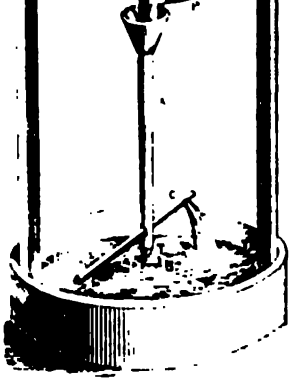

Fig. 1.

Barker towards the end of the 17th c. It is esented in its simplest or typical form in 1. A is a wide metal pipe, resting at its r end by the steel spindle T, on a metal block ad kept in a vertical position by the spindle S, at its upper end, which passes through the frame of the machine, so that it can easily revolve round its axis. Near its lower end, two smaller pipes or arms, C, C, are inserted, which project horizontally from it, and these have each, at the outer extremity, a hole cut vertically in them, opening towards opposite sides. The water is supplied by the pipe P, which opens over a funnel-like widening on the upper part of A, and the quantity is so regulated that while the pipe A is kept nearly full, no more is admitted than issues from the lower orifices. The reaction caused by the water gushing from the arms, forces them backwards, and gives to the whole machine a rotatory motion. This reaction is much the same as is seen in the recoil of a gun when fired, or in the pushing back of a small boat by the foot on stepping ashore. It may be also thus explained: Suppose that the arms were closed all round, the water would press against the sides with a force proportional to the height of the water in the pipe A, and the pressure against any particular surface of the side would produce no motion of the arm, because an equal pressure is exerted in a contrary direction by a corresponding surface opposite to it. Now, if one of these surfaces be cut out, the pressure against the other being uncounteracted, forces the arm in the opposite direction to that of the side in which the hole is made. This being done to both arms on opposite sides, two equal pressures are produced, which conspire in generating the same motion of rotation. As soon as motion ensues, centrifugal force comes into play, which, throwing the water out towards the ends of the arms, increases the rapidity of its discharge, and also its reacting power. When the wheel is in action, the water thus acts under the influence of two forces, one being the pressure of the column in A, and the other the centrifugal force generated by the rotation of the wheel itself. The motion of the wheel is transmitted by the spur-wheel fixed to the spindle S, to the machinery which is to be driven by it, or, in the case of a corn-mill, the spindle passes directly through the lower millstone, and is firmly fixed into the upper one.

The power is manifestly increased by heightening the water-column, or by lengthening the arms—the former increasing the pressure of the water, and the latter increasing the leverage at which this pressure acts. In the mill shewn in the figure, the column in A cannot be advantageously heightened, for the higher it rises, the greater must be the weight which the conical spindle, T, has to sustain, and the greater, consequently, becomes the friction. It is from this circumstance that such mills are found, in practice, to yield but a small mechanical effect the friction consuming too large a proportion of the work of the wheel. Hence, in the reaction-wheels now in use, the original B. M. has been so modified as to allow of the water being conducted from the reservoir below the arms instead of above. This is effected by making the vertical pipe revolve below in a stuffing-box at its junction with the conduit, and above, by a pivot moving in the fixed frame. By this arrangement, the friction attending the rotation is reduced to a minimum, for not only is the weight of the water placed out of account, but also a large proportion of the weight of the wheel itself, which is borne by the upward pressure of the water. The mechanical performance of such wheels is said to be highly satisfactory, producing, with a limited supply of water falling from a considerable height, a useful effect, hardly to be obtained by any other contrivance. The power of these machines may be also

increased by using curved (fig. 2) instead of straight arms. With straight arms, a considerable loss of force is incurred by the sudden change of the direction of the current when it leaves the arm, which does not take place to the same extent with curved arms, where this change is effected gradually. In Whitelaw's Mill (hence called the Scottish turbine), the form of B. M. generally met with in Scotland, there are three instead of two curved arms of this description. Considerable difference of opinion still exists as to the merits of B. M., some considering it as the most perfect way of applying water-power, and others putting it in the same rank as an under-shot wheel, with the same water-supply. Of late years, it has been more extensively employed than formerly, both in this country and on the continent. See WATER-POWER.

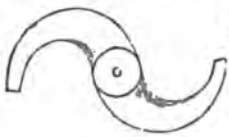

Fig. 2.

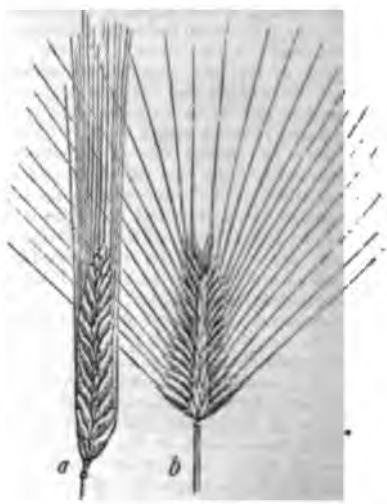
BA'RK-STOVE, in Gardening, a kind of hot-house intended for those plants which require not only the greatest heat, but also a continually moist atmosphere. It derives its name from the use of tanners' bark, for the purpose of producing this atmospheric condition. The bark is placed in a pit, lined and paved with brick, and pots containing tropical plants are sunk in it; by which means the plants not only enjoy a moisture resembling that of their native climates, but the earth around their roots is kept uniformly and moderately heated. The principle of the B. is adopted in pineries, palm-houses, orchid-houses, &c., also in forcing-stoves employed for producing the ordinary fruits and vegetables of temperate climates at unusual seasons. A considerable heat results from the fermentation of tanners' bark, but it is not upon this that its value in the B. chiefly depends.

BA'RLAAM AND JO'SAPHAT, one of the most widely-spread religious romances of the middle ages, relating the conversion of the Indian prince Josaphat by the hermit Barlaam, and thereby illustrating the power of Christianity to overcome temptation, and proving its superiority over all other creeds. The celebrated divine, John Damascene, has been by some erroneously supposed the author of the original Greek MS., while others have attributed it to the church historian Anastasius Bibliothecarius. At all events, it was the production of an eastern, possibly an Ethiopian Christian. The Greek original was first published by M. de Boissonade, in the 4th volume of his *Anecdota* (Paris, 1832), and translated into German by Liebrecht (Münst. 1847). But even in the middle ages, a Latin version of this romance had been extensively circulated. About the end of the 15th c., it was often printed in a detached form, and later, it appeared amongst the works of John Damascene (Paris, 1609). Vincent de Beauvais wove the story into his *Speculum Historiale*. From the Latin version sprung three French poetical versions belonging to the 13th c., and as yet unprinted. The Italian *Storia di S. Barlaam* (latest edition, Rome, 1816) may be traced to a Provençal original as early as the beginning of the 14th c. In Germany, Rudolf von Ems derived his poem, *B. and J.*, first printed at Königsberg (1818), and later at Leipsic, from the Latin of John Damascene. There is also an Augsburg impression of a prose translation of the ancient Latin text, belonging to the close of the 15th c. The Spanish *Historia de B. y J.*, by Juan de Arze Solorzano (Madrid, 1608), the Polish poetical version, by Kulizowsky (Cracow, 1688), as well as the Bohemian (Prague, 1593), are all borrowed from the Latin; while the Icelandic *Barlaams Saga*, and the Swedish popular tale, *B. och J.*, have a German source. A Norwegian version, printed from an old vellum MS. of the beginning of the 13th c., said to have been translated by King Hakon Sverreson, appeared in 1851. This romance has even been rendered into the Tagala language of the Philippines, and there printed (Manilla, 1712).

BAR-LE-DUC, or BAR-SUR-ORNAIN, a town in the department of the Meuse, France. It is situated on the Ornain, about 125 miles east from Paris, with which it is connected by railway, and with the Rhine by canal. Pop. (1872) 14,664, who manufacture cotton and calicoes, and carry on a considerable trade in timber from the Vosges, for the use of Paris, and in iron, wool, and wine. B. has a communal college, normal school, and public library. Its origin dates from the 10th c.

BARLETTA, a fortified seaport of Italy, province of Bari, on the Adriatic. Pop. (1872) 28,163, who carry on a large shipping-trade with Greece, the Ionian Islands, and other ports of the Adriatic. The town is well built, handsome, and clean; has a fine cathedral, a colossal statue supposed to represent the Emperor Heraclius, a college, theatre, and castle, formerly one of the most impregnable fortresses in Italy. A feature of B. is the large and magnificent gateway which leads to its harbour. During the blockade of B. by the French in 1502—1503, which ended in the defeat and death of their commander, the Duke of Nemours, the celebrated combat between eleven cavaliers of France, and as many of Spain, in which the Chevalier Bayard so distinguished himself, took place, and ended in a drawn battle.

BA'RLEY (*Hordeum*), a genus of Grasses, to which belongs one of the most extensively cultivated kinds of grain. The genus is distinguished by



Barley.
a, two-rowed barley; b, sprat or battledore barley.

spiked inflorescence, three spikelets being always situated upon each tooth of the rachis, of which sometimes only the middle one is fertile, and sometimes all the three, so that in the former case the fruit-bearing spike is two-rowed, and in the latter case, six-rowed; the glumes are two, containing a

ret; the palea two, the outer one awned; seed is surrounded by the palea. The species genus are almost all annual, although some of B. are sown in the end of autumn, and ation of them extends over the winter. B., there are many varieties, of which the ...n or Early English B., the Italian B., and the ...r *B.* are among the most esteemed, the ...eing in particular demand for the brewing of ...st ales. It takes its name from M. Chevalier, ...troduced it.—The *Sprat* or *Battledore B.* (*H. zeocriton* of many botanists) is also two-rowed, but is distinguished by the grains standing out from the spike, their awns spreading very widely. It is sometimes called *German Rice*, as it swells by boiling in the way that rice does, and for some purposes forms a good substitute for it. It is scarcely cultivated in Britain, but is in much esteem in Germany, and succeeds well in the Alps at an elevation of 3360 feet.

Three species of *Hordeum* are natives of Britain, of which one (*H. murinum*), a small grass, is pretty common on waste-grounds, especially in England, and is apt to prove troublesome by its long awns causing inflammation in the mouths of cattle. Still more injurious in this way is the North American *H. jubatum*, or Squirrel's Tail. Another, MEADOW B. or MEADOW B.-GRASS (*H. pratense*), frequent in meadows in England, is reckoned a good pasture-grass. *H. bulbosum*, a native of the south of Europe and north of Africa, is cultivated in Britain for herbage, of which it yields a large quantity, much relished by cattle, and particularly by horses. Several species are natives of North America.

BARLEY, CULTIVATION OF. Barley was cultivated largely by the Romans, as well as many other nations of antiquity. Though sometimes used as food by the soldiers, it was most generally used as food for horses. The ancient inhabitants of Gaul prepared a spirituous liquor, a kind of beer, from it. Many of the other western nations latterly applied it to the same use, and it also became an important article of food. Being a plant which is most productive where the climate is moderately dry and warm, the excessive heats of some parts of Europe are adverse both to the quantity and quality of its grain. It is, however, cultivated to a large extent in some parts of the continent where the soil is specially suited to it, such as in Belgium, Holland, Prussia, and Denmark. Indeed, while most of the countries of Europe send us wheat, it is chiefly Denmark and Silesia that supply us with barley. For this reason, the prices of B. have been relatively higher in this country than those of wheat, since the introduction of free-trade in grain. No country seems to possess a soil and climate so well suited to its growth as many parts of Britain. In former times, this grain was largely used in the British Islands as human food; but this is not the case now, except in some parts of Ireland and, in a stray instance, in the Highlands of Scotland, where the condition of the population has undergone comparatively little amelioration. In Scotland, however, a considerable quantity is made use of in the making of broth. In this case, the grain is denuded of its husk by the friction of revolving millstones, and goes under the name of Pot Barley. But the larger proportion of the B. grown in Great Britain, as well as that which is imported, is employed in the distillation of spirits, and in the manufacture of beer, ale, and porter. The moderate qualities are taken up by the distillers, while the brewers of ale and porter require the finest, which are known by the silvery colour of the husk, and the specific gravity of the grain. Fine malting B., therefore, always commands a ready demand in the London market, as well as a high price. For several years barley has not only grown better than any other grain with the British farmer, but has commanded relatively the best prices.

Perhaps the cultivation of B. occupies as prominent a share of the arable lands of Suffolk and Norfolk as of any other part of Britain. Fine malting qualities are grown on the turnip-soils of these counties, as well as throughout the south-eastern counties, where the four-course rotation is adopted. In this rotation, the B. follows the

turnip-crop, which is usually consumed on the land by sheep. The ground is carefully prepared by ploughings and rollings, to pulverise it thoroughly before the reception of the seed, which is usually sown by a drill machine at the rate of about two bushels to the acre. On the strong lands of Suffolk and Huntingdon, the B.-crop is sown after a summer-fallow or a green-crop, in which case the soil is ploughed before the frosts of winter set in, to render it friable by spring. As soon as the weather permits, after the first week of February, the seed is committed to the ground. A fine mould is in this way obtained, and the crops are usually abundant and of good quality. In the south of England, the grain is allowed to stand till it is fully ripe, when it is either cut with the scythe or most commonly now with the reaping-machine. In some parts, it is not bound up into sheaves, but remains in the swath for a few days, when it is afterwards carted, and stored into barns. A small portion of the B.-crop is still thrashed out by the flail, owing to the maltsters being under the impression that the thrashing-mills injure the germinating powers. The chief varieties grown in England are the Chevalier, the Common, the Early English, and the Norfolk. The first named is the most largely sown, as the quality is superior to any other, and, under liberal treatment, the yield is greater. The produce is more influenced by the seasons than that of wheat, as it is liable to suffer from droughts in the early part of the year. On well-farmed land, from 48 to 60 bushels and upwards are got to the acre. In the peaty soils of the fens of Lincolnshire, B. is not raised, as it is too liable to lodge with the rain; neither is B. a favourite crop in the moist climate of the west of England. It does not endure the rains so well as wheat, nor do so well on highly farmed land. In Wales and Lancashire, it is generally grown after a crop of wheat, and the cultivation and management are not so careful as in the east.

Barley has long been grown in Scotland, and comes to great perfection where the soil and climate are suitable. The level parts of the Lothians and other counties in the east of Scotland, with Moray, Inverness, and Ross in the north, are the districts in which the finest crops are raised. In these rich districts, B. is commonly sown after a portion of the turnip-break. For this reason, it does not occupy so large a proportional breadth as it does under the Norfolk four-course. The produce is equally abundant, however, and the quality of the grain is often not inferior. Chevalier is the favourite variety there also. The crop, when ripe, is cut by sickle, scythe, or reaping-machine; bound up at once, and put into stooks, to defend it from the weather till ready to cart, and to be built up in neat round stacks. The grain is invariably thrashed out by machinery. In the higher districts of Scotland, where the soil and climate are not so good, the inferiority of the grain, unless in an especially favourable year, both in quality and quantity, is considerable. It is only in fine seasons that the quality is such as to render it an object to maltsters, and in wet, cold unsuitable seasons, distillers can only make use of it at a reduced price. The Chevalier variety is a little late for inferior climates, and the Early English and other kinds that come sooner to maturity are often preferred. In Berwickshire, Aberdeenshire, Banffshire, Kincardineshire, and Forfarshire, the five-course rotation—of two years' grass, oats, turnips, and B.—is more generally adopted than in some other counties in Scotland, and a large quantity of this grain is raised, but the quality is generally inferior to that of the crops in East Lothian. Along the light soils fringing the Moray and Cromarty firths, a quality of grain is got as in East Lothian. shire barley has long been famous for sample, and is in great demand with brewers. On the other hand, in the la climate of the western counties, and upper parts of Aberdeenshire, Banffshire, shire, less B. is sown, and oats frequently green-crops. In these parts the variety bear, or bigg, was for many a day preferred other, as it is not so liable to lodge, and stands wet weather far better, and comes maturity. Bear, too, is the variety wh vated by many of the small cotters in lands and islands. Instead of a rotation green-crops find a place to husband and natural resources of the soil, a succession crops are taken, with an occasional rest soil, and then a resumption of the croppi

As to the manuring of the crop, on soils of the south of England, the land by the droppings of the sheep. In the of Norfolk and Huntingdon, guano, rape other manures abounding in nitrogen, a when the seed is sown. In the west of the moist climate renders the application o more precarious, and B. is frequently taken crop of wheat without any application of ferti When the turnip-crop is drawn from the land often is in Scotland, guano is the manure held most estimation; the quantity applied is to 4 cwt. per acre. In Berwickshire and shire, as in Norfolk, the prevalence of course shift, and the practice of eating the ground, secure a sufficiently liberal a other parts, where B. is taken after yard manure is often applied, as well as phosphoric manures. In some northern the root-crops are laid down with artificial and the roots carted off, farm-yard manure on the land and ploughed in with the seed Barley requires a fine tilth and soil in rich condition. The earlier it is sown in the more liberal ought to be the application of genous manures. The later it is sown, containing nitrogen should be used more spar and a portion of phosphoric manures substi in their stead.

BARLEY-BREAK, a popular amusement common in the reign of James I., and, with modifications, in name and practice still among young persons, both in England and land. Originally, it was played by people of each sex, who were formed into couples of ground was then apportioned and into the centre one, called doomed by lot. The sport consisted in the condemned part 'catching' one couples while they were in the act places, when the couple caught had to centre. It was, however, no easy matter in the centre to capture another couple, rules of the game, they were bound to k while the others, when hard pressed Thus, Sir Philip Sidney, in describi says:

> Soon as the middle two
> Do, *coupled*, towards either couple make,
> They false and fearful do their hands undo.

When the whole had been caught, the ended, and the last couple taken was sai hell. Their punishment appears to have in kissing each other. Herrick says, in re the game:

> If kissing be of pleasure the worst,
> We 'll wish in hell we had been last and first.

In Scotland, the game consisted in one person chasing the rest round the stacks in a farmyard; and when one was caught, he or she had to assist in capturing the rest. The origin of the name is doubtful. Dr Jamieson suggests that, in Scotland, the locality of the game may have given it its name—'barla-bracks, about the stacks.' The same authority also adds: 'Perhaps from *barley* and *break*, q., breaking of the *parley*, because after a certain time allowed for settling preliminaries, on a cry being given, it is the business of one to catch as many prisoners as he can.' This supposition is not improbable. In the modern games of 'Shepherds a-warning,' and 'Tig,' which appear to have been derived from B., 'a barley' means a *parley*.

BA'RLEYCORN, John, a personification of the spirit of barley, or malt-liquor, used jocularly, and also in humorous poetical effusions. There exists a whimsical English tract of old date, under the title of *The Arraigning and Indicting of Sir John Barleycorn, Knt., printed for Timothy Tosspot*, in which Sir John is described as of 'noble blood, well beloved in England, a great support of the crown, and a maintainer of both rich and poor.' See Hone's *Every-day Book*, vol. i.

BARLEY-SUGAR, a confection prepared with sugar and a decoction of barley. See Sugar.

BA'RLOW, Joel, an American poet and politician, born in 1755 at Reading in Connecticut. He studied at Yale College in Newhaven. He was intended for the profession of the law, but served as a military chaplain during the War of Independence. In 1787 he published a poem called *The Vision of Columbus*, which in 1805 appeared anew in an enlarged form as *The Columbiad*. It abounds in beautiful passages, but is overburdened with political and philosophical disquisitions, and disfigured by singularities of expression. B. accepted a commission in 1788 to prosecute the sale of lands for the Ohio Company in England and France, where he signalised himself by zealous republicanism; published in 1792 in London a poem entitled *The Conspiracy of Kings*, and endeavoured also to work upon the public mind in England by political pamphlets. In autumn 1792 he was deputed by the London reformers, with whom he was associated, to proceed to Paris, where he received the rights of French citizenship. He spent some years on the continent of Europe in political, literary, and mercantile pursuits, and was for a short time American consul at Algiers. He returned to America in 1805, and was appointed ambassador to France in 1811. He died in October 1812 at Zarnawicze, near Cracow, when on his way to a conference with the Emperor Napoleon at Wilna.

BARM. See Yeast.

BA'RMECIDES, or **BA'RMEKIDES**, a Persian family, distinguished amongst the most powerful in the province of Khorasan, the cradle of the greatness of the Abbaside califs, whose cause the *children of Barmek* espoused. *Khaled-ben-Barmek*, the first of these whose authentic history has reached us, was the prime-minister of Abul Abbas Al-Saffah, the first Abbaside calif; and his influence enduring through the reigns of Al-Mansur and Mohdi, the latter intrusted him with the education of his son, the celebrated Harun Al-Raschid. Yahya, the son of Khaled—according to eastern historians, equally conspicuous for virtue and talent—was made vizier by Harun upon his accession to the califate (786 A. D.), and both by his military skill and civil administration, contributed largely to the prosperity of the reign—the calif himself bestowing on him the appellation of Father. Harun, however, afterwards becoming jealous of the growing power and popularity of two of Yahya's sons, Fadhl and Jafar (the Giafar of the *Arabian Nights*), had them executed, and the whole of the B. throughout the kingdom arrested, and their goods confiscated. Harun even carried his enmity so far as to forbid the mention of their name on pain of death; but their virtues and their glory are celebrated by almost all Mohammedan poets and historians.

BA'RMECIDE'S FEAST, a phrase originating most probably in the story of the barber's sixth brother, recorded in the *Arabian Nights*, and abridged in the *Guardian*, No. 162. The substance of the story is as follows: One Schacabac being in great want, and not having tasted food for two days, ventured to visit a rich Barmecide (see Barmecides) noted both for his hospitality and eccentric humour, in the hope of generous entertainment. The Barmecide, on learning his condition, invited him to dinner. Schacabac was presented with an empty plate, requested to 'make himself at home,' and by and by, asked 'how he liked his rice-soup.' It was apparently a cruel jest to play off on a starving man. Schacabac, nevertheless, feigned to enter into the humour of his host, and expressed his conviction that the rice-soup was delicious. The Barmecide continuing the imposition, next asked his victim if he ever saw whiter bread. Poor Schacabac, who saw neither bread nor meat, nor indeed anything eatable, made a prodigious effort to look happy; he even went the length of gently remonstrating with his host for not supposing him completely satisfied. In this way a magnificent but fictitious dinner was disposed of. When wine, however, was produced, Schacabac pretended only to taste it on the ground that he was 'quarrelsome in his liquor,' and might do his host an injury. The Barmecide forced him, however, and at last Schacabac, who was really in a most excusable rage at being so elaborately tantalised, feigned to have got flustered, and gave the eccentric old gentleman 'a good box on the ear.' This put a stop to the joke. The Barmecide was mightily pleased with the patient humour of his guest, a visible dinner was immediately ordered up, and Schacabac now enjoyed in reality what he had previously partaken of only in imagination.

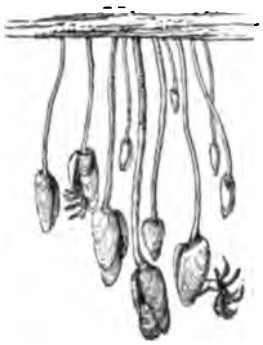
BARMEN, a most charming valley, about two leagues in length, on the Wupper, about two leagues from Elberfeld, in the province of Rhenish Prussia. It is divided into Upper and Lower B., and contains five towns or villages, which united form the town of B., with (1871) 74,496 inhabitants, chiefly Protestants. Nowhere in Germany is so much manufacturing industry accumulated in a single spot. B. is the principal seat of the ribbon-manufacture on the continent. Its fabrics go to all parts of the world. It produces linen, woollen, cotton, silk and half-silk ribbons of every quality, and all sorts of stay-laces, &c. It has also considerable manufactures of woven lace, sewing-thread, the coarse cotton cloth called *Siamoise*, &c. There are, besides, in the valley, numerous bleachfields and dye-works. Lower B. has a mineral spring and a bathing establishment.

BA'RNABAS, St, properly **Joses**, mentioned in the Acts of the Apostles as a fellow-labourer of Paul, and even honoured with the title of apostle. He is also supposed to have founded the first Christian community at Antioch. According to tradition, he became the first Bishop of Milan, but he is differently reported to have died a natural death, and to have suffered martyrdom at the hands of the Cypriot Jews, 61 A. D. The Epistle ascribed to him is of very doubtful authenticity.

BA'RNABAS, St, Epistle of. This Epistle contains twenty-one chapters. Its aim is obviously to strengthen the faith of believers in a purely spiritual Christianity. It commences by declaring that legal sacrifices are abolished, and then proceeds to shew, though not in a very coherent or logical manner, how variously Christ was foretold in the Old Testament. In the tenth chapter, it spiritually allegorises the commands of Moses concerning clean and unclean beasts; in the fifteenth, it explains the 'true meaning' of the Sabbath; and in the sixteenth, what the Temple really prefigured. This concludes what may be termed the doctrinal portion of the Epistle; the remainder, which is of a practical character, describes the two ways of life—the way of Light and the way of Darkness, and closes with an exhortation that those who read it may so live that they may be blessed to all eternity. It is a simple, pious, and earnest work; but makes a far more judicious use of the New Testament than of the Old.

BA'RNABITES, an order of monks which sprung up at Milan in 1530. They were so called because the church of St Barnabas in that city was granted them to preach in. They were approved of by Pope Clement VII. and Pope Paul III. Their special duties were, to attend the sick, to preach, to instruct the young, and to take the charge of souls. They soon established themselves in Italy, France, Austria, and Spain, and enjoyed the privilege of teaching theology in the schools of Milan and Pavia. Many eminent men have been sent forth by them. Besides the three usual monastic vows, they took a fourth, viz., not to sue for church preferments. In France and Austria, they were employed in the conversion of Protestants; but they have now, as a body, almost fallen into oblivion. Only a few monasteries exist here and there in France and Italy.

BA'RNACLE, or BE'RNICLE (*Lepas*, also called *Anatifa* and *Pentalasmis*), a kind of shell-fish, a genus of *Cirrhopoda* (q. v.), the type of a family of articulate animals distinguished by a long flexible stalk or peduncle, which is provided with muscles, upon the summit of which, in the true barnacles, are shelly valves, five in number, enclosing the principal organs of the animal, and opening and closing on one side like the opercular valves of *Balanus* (q. v.), to admit of its spreading out and retracting its net—an apparatus similar to that by which the animals of that genus obtain their food. Barnacles abound in almost all seas, attaching themselves in great numbers to logs of wood, ships' bottoms, &c. They grow very rapidly. Some of the

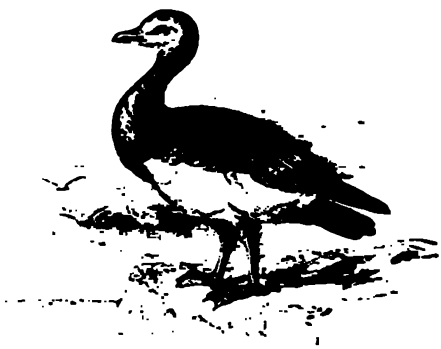


Barnacle.

species are eaten in some parts of the world, and perhaps they were among the *lubani* which the ancient Romans esteemed a delicacy.—In some circumstances, very nearly allied to the true barnacles, and resembling them in general form, the shelly valves almost entirely disappear.

In former times, the B. was supposed to be the embryo of a goose or bird of some kind; a notion which doubtless arose from a fancied resemblance between the convolutions of the fish in its shell and the embryo of a bird in the egg. It was, therefore, believed that the barnacle goose, described in next article, sprung from these marine shells. Hollinshed gravely affirms that such was the case; and the most learned men of their time were weak enough to give credence to the absurdity. Gerard, in his *Herbal* (1597), declares, that after 'a thing in form like a lace of silke finely woven, as it were, together'—which he correctly enough states to be 'the first thing that appeareth' when 'the shell gapeth open'—there next follow 'the legs of the bird hanging out;' and at last the bird, increasing in size, 'hangeth only by the bill,' and 'in short space after it cometh to full maturity, and falleth into the sea, where it gathereth feathers and groweth to a fowl bigger than a mallard, and lesser than a goose,' &c. All this was represented as constantly taking place on the coast of Lancashire and the Hebrides, and continental writers of greater name reported in like manner the same fable, against which Ray and other early naturalists were obliged seriously to argue. The B., however, really undergoes transformations not less wonderful than the fabled ones, which have rendered it an object of so much interest. See Cirrhopoda.

BA'RNACLE GOOSE, or BE'RNICLE GOOSE, often also called Barnacle, or Bernicle (*Anser*



Barnacle Goose.

Bernicla or *leucopsis*), the bird which the fables of former days represented as deriving its origin from the cirrhopod of which it bears the name. It is in size smaller than the common wild goose, being only a little more than 2 feet long, and about 5 lbs. in weight. It is very prettily marked, having the forehead, cheeks, and throat white, the bill black, and a black stripe extending from it to the eye; the crown of the head, neck, and upper part of the breast black; the rest of the plumage on the upper parts of the body chiefly ash-gray and black, in undulating bars—on the lower parts, white. It is a common winter visitant of the western coasts of Britain and of Ireland, but in the eastern parts of Britain it is rare. It retires in spring to more northern regions, where it breeds, vast numbers passing northward along the coast of Norway to the Arctic Ocean. It is highly esteemed for the table.

The Brent Goose, or Brent Barnacle (*Anser Brenta* or *torquatus*, *A. Bernicla* of some naturalists), has frequently received the name of the B. G., and no

little confusion has existed concerning them in books of science, although the birds are sufficiently distinct. The Brent Goose is smaller than the B. G., being only about 21 inches in length. It is also of much darker plumage, the whole head, throat, and neck being black, except a small patch on each side of the neck, which is white, mixed with a few regularly placed black feathers; the upper parts of the body generally almost black, and the lower parts slate-gray, except the vent and under tail-coverts, which are white. It is remarkable for length of wing and powerful flight, and for its distant migrations. It is very common in winter on the British shores, but breeds in high northern latitudes. It is a winter-bird of passage in the United States and Canada, as in Britain and on the continent of Europe. It is excellent for the table.

Very nearly allied to these species is the Red-breasted Goose, or Red-breasted Barnacle (*Anser ruficollis*), a beautiful bird, of which the neck and upper part of the breast are of a rich chestnut red. In size, it resembles the Brent Goose; it is a very rare visitant of Britain and of the continent of Europe, and is abundant only in the extreme north of Asia.—Another species, called Hutchins' Goose or Barnacle (*A. Hutchinsii*), of dark plumage, and with a triangular patch of white on each side of the head and neck, is abundant in Hudson's Bay, and the extreme north of America.

These species are regarded by some naturalists as constituting a genus *Bernicla*, distinguished chiefly by a shorter and more slender bill from the ordinary or true geese.

The Egyptian Goose or Bargander (*Anser Egyptiacus*) is sometimes ranked with these, sometimes made the type of a distinct genus, *Chenalopex*, upon account of the longer bill, a short spur with which the bend of the wing is armed, and the anatomical peculiarity of a hollow bony enlargement at the bottom of the trachea of the male. It has long been kept in parks and pleasure-grounds in Britain, chiefly on account of the beauty of its plumage, and has become partially naturalised. It is a little smaller than a common goose; its voice more resembles that of a wild-duck. The prevailing colour of the plumage is light chestnut brown, minutely rayed with darker lines; the neck and part of the wings are white. Large chestnut patches surround the eyes. It is very abundant on the Nile, and is frequently figured in Egyptian sculptures. It is much esteemed for the table, and was kept and fattened for it by the ancient Egyptians. It is the *Chenalopex* of Herodotus.

BA'RNACLES, in Heraldry, resembling what are now called twitchers, were instruments used by farriers to curb and command unruly horses. B. are frequently introduced into coats of arms as a charge.—The term BARNACLES, applied to spectacles, is derived from *beryllus*, a transparent stone; dim. *berylliculu*, *berynicula*, *bernicula*. Old Fr. has *bésicle*; the dialect of Berri, *besiques*. Twitchers resembled the original spectacles that clasped the nose.

BA'RNARD CA'STLE, an inland town in the south of Durham county, on the right bank of the Tees, about 40 miles from its mouth, and 26 miles south-west of Durham. It stands on the slope of an eminence rising from the river. Its chief manufactures are hats, carpets, shoemakers' thread, leather, plaids, and stockings. It has one of the largest corn-markets in the north of England. On a rocky height over the river are the ruins (covering 6½ acres) of a castle, founded about 1180 by Barnard, son of Guy Baliol, a follower of the Conqueror, and ancestor of John Baliol, king of Scotland, who was born in the castle, and founded an hospital for the poor in the town. B. C. is the scene of part of Sir W. Scott's poem of *Rokeby*. Pop. (1871) 4306.

BARNAU'L, a town of West Siberia, in the government of Tomsk. It is situated at the junction of the Barnaul with the river Oby, and has a population of (1867) 12,928, who are chiefly engaged in the mining and smelting of the metals found in the vicinity, which consist of silver, lead, and copper. B. has 120 furnaces at work, is the seat of a mining board, and has a magnetic and meteorological observatory.

BARNAVE, ANTOINE-PIERRE-JOSEPH-MARIE, a distinguished character and victim of the French Revolution, was born at Grenoble in 1761, was the son of an advocate, adopted his father's profession, and early attracted attention in the parliament of Grenoble by the talents which he displayed. A pamphlet which he published against the feudal system led to his being returned as deputy from his province to the States-general in 1789. He zealously advocated the proclamation of the Rights of Man, was vehement in opposition to the Absolute Veto, carried through the confiscation of church-property to the use of the nation, the emancipation of the Jews, and the abolition of the religious orders, and was mainly instrumental in the liberation of the slaves and reorganisation of the colonies. As a leader of the extreme party in the earlier stages of the revolution, he became the idol of the people, and particularly after his victory over Mirabeau, in the question of the power of peace and war, which Mirabeau wished to remain with the king, and B. successfully claimed for the National Assembly. He subsequently, however, became inclined to a more moderate course; the consequences of the sudden changes in the colonies appear first to have alarmed him; and being sent, along with Latour-Maubourg and Pétion, to bring back the king after his flight, he was much moved by the spectacle of the misfortunes of the royal family, and thenceforth endeavoured to render them all the assistance in his power. He defended, in a speech of great vehemence, the inviolability of the king's person, and resisted the assertion by the Assembly of power to remove ministers. His general opposition to the increasing violence of the revolutionary torrent, and this last step in particular, destroyed his popularity; he was regarded as a renegade from the national party, and was assailed by the fierce vituperations of the daily press. He retired to his native place on the dissolution of the National Assembly; but after the 10th of August 1792, he was impeached, along with Lameth and Duport-Dutertre, on account of correspondence with the court; was brought to Paris, tried before the Revolutionary Tribunal, condemned, and guillotined on the 29th of November 1793.

BA'RNET, CHIPPING, a town in the south of Hertfordshire, on a hill-top, 11 m. north-north-west of London. Pop. (1871) 3720. It was formerly a great thoroughfare, but since the advent of railways, its once bustling appearance is sadly altered. Here, in 1471, was fought the famous battle of B. between the Yorkists and Lancastrians, in which the latter, after a desperate struggle, were routed, and their leader, Warwick, 'the king-maker,' killed, by which event Edward IV. was firmly established on the throne. A commemorative obelisk is now erected near the spot.

BA'RNEVELDT, JAN VAN OLDEN, Grand Pensionary of Holland, born 1549, early shewed great ardour in the cause of the independence of his country. As advocate-general of the province of Holland, he proved equally his insight into affairs and

his address in diplomatic management. Penetrating the secret designs of Prince Maurice (q. v.) of Orange, he became the head of the republican party, which aimed at subordinating the stadtholder to the legislature. It was he also who opposed the warlike tendencies of Maurice, concluded (1609) a truce with Spain, and prevented the States-general from taking part in the revolt of the Bohemians. His increasing influence excited the House of Nassau to still greater jealousy, which in the religious controversies between the Remonstrants (q. v.) and Gomarists degenerated into the bitterest hostility. With the view of obviating a civil war, B. proposed an ecclesiastical assembly, which resulted in agreeing to a general toleration in respect of the disputed points. The states at first concurred in this wise measure; but the intrigues of the Orange party brought about a change of views, by representing the Remonstrants as secret friends of Spain. B., who sympathised with the more tolerant principles of that party, was attacked in scurrilous publications, and was insulted even in the meeting of the states by the mob, with whom Maurice was an idol. The strife between the Remonstrants and Gomarists became hotter every day, and threatened to end in civil war. In the meantime, Maurice procured the summoning (1618) of the Synod of Dort (q. v.), which condemned the Remonstrants with the utmost rigour and injustice. This decision encouraged Maurice to proceed to the most violent measures. Regardless of the opposition of the states, he arrested B. and other chiefs of the Remonstrants, and got 26 venal judges to condemn as a traitor the innocent man to whom his country owed its political existence. It was in vain that his friends and relations raised their voice; equally vain was the interference of the Dowager Princess of Orange and of the French ambassador; Maurice was not to be moved. On May 13, 1619, the venerable man of 72 years of age mounted the scaffold, and laid down his head with the same firmness that he had shewn through all the events of his life. His sons, Wilhelm and René, were at the same time dismissed from office. Wilhelm and the Remonstrants formed a conspiracy against the life of the prince; but it was discovered, and Wilhelm escaped to Antwerp. His brother René was seized in his stead, and condemned to death, although he had dissuaded Wilhelm from his attempt. The mother, who had not sued in the case of her husband, because he was innocent, now, when there was blame, interceded with the prince for the life of her son; but in vain; he, too, was executed, 1623.—See Motley's *Life of B.* (2 vols. Lond. 1874).

BARNSLEY, a town in the West Riding of Yorkshire, 39 miles south-west of York, on the river Dearne and the Dearne and B. Canal. It is situated on a hill, has coal and iron mines, linen manufactures, bleaching and dye works, iron foundries, wire-works, and glass-works. The damasks and drills, and the iron-wire made here are said to be unrivalled. Much of the flax spun in Leeds is woven at Barnsley. An explosion in Oak Colliery in 1847 killed 72 persons. Pop. (1871) 23,021.

BARNSTAPLE, a town in north-west Devonshire, on the right bank of the Taw, 6 miles from its mouth, and 34 north-west of Exeter. Being the chief city of north Devon, and occupying a fine healthy situation, it is the residence of many respectable families. The Taw is here crossed by an ancient bridge of 16 arches, which has been widened by iron-work on each side. In consequence of the river and harbour having become filled up with sand, unfitting them for large ships, much of the trade of B. has been transferred to Bideford. It has manufactures of pottery and lace. It sends two members to parliament. B. has existed since the reign of Athelstan, who built a castle here. The poet Gay was born near the town, and educated at its grammar-school. Pop. (1871) 11,790.

BAROCHE, Pierre-Jules, an eminent French politician, was born at Paris on the 8th November 1802. He passed as an advocate in 1823, and distinguished himself by his talents as a pleader. In 1847, he was sent to the Chamber of Deputies as representative of Rochefort, took his position among the moderate reform party, and was one of those who signed the accusation drawn up against the Guizot ministry. During the republic, he voted at first along with the democratic party, but subsequently supported General Cavaignac, and, after the 10th December, the politics of Louis Napoleon. B. was now made Procureur-général of the Republic at the Paris appeal court, in which function he played a conspicuous part. In March 1850, he succeeded Ferdinand Barrot as Minister of the Interior, after which he became a decided Bonapartist, and carried through several restrictive measures, both commercial and political. In April 1851, he was appointed Minister of Foreign Affairs, with Leon Faucher as colleague. After the *coup d'état* of the 2d December 1851, B. accepted the vice-presidency of the Consultative Commission, and was authorised to make known officially the result of the *plebiscitum*. From that period, B. stood high in favour with the emperor, and in 1855 received the grand cross of the Legion of Honour.

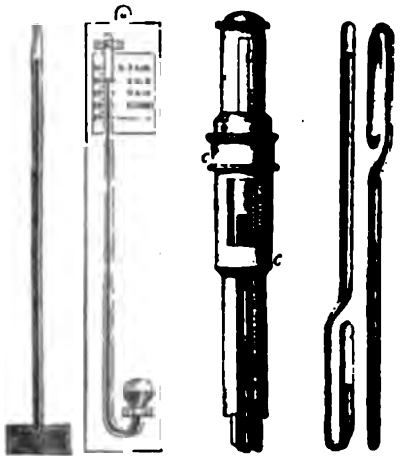
BARO'DA, a city of Guzerat, in lat. 22° 16′ N., and long. 73° 14′ E. It is 40 miles from Tunkaria, on the Gulf of Cambay, 81 to the north-north-east of Surat, and 231 north of Bombay. It stands on the Biswamintri, which is here crossed by a stone-bridge of singular construction—an upper range of arches resting on a lower one. B. is the residence of the Guicowar, a protected Mahratta prince. Pop. about 150,000; trade considerable. It occupies an important position between the coast and the interior. Some years ago, the Guicowar contemplated the construction of a railway to Tunkaria; and at last English capital is accomplishing a far longer line, which, as its name implies, will connect B. with Bombay in the one direction, and with Central India on the other.

BARO'METER (Gr. *baros*, weight; *metron*, a measure), an instrument for measuring the weight or pressure of the atmosphere. The term is generally understood to refer to one in which the measure is the height of a column of liquid sustained by atmospheric pressure. The fundamental principle of the construction of the B. is best shewn in the experiment which led Torricelli to the first discovery of the pressure of the air. A glass tube, about 33 inches in length, open at one end, is completely filled with mercury, and, being firmly closed by the thumb, is inverted and placed vertically in a cup containing mercury. When the thumb is removed, the mercury sinks in the tube till it stands, generally, about 30 inches above the level of the mercury in the cup, leaving in the upper part a space free of air, which receives the name of the Torricellian vacuum (fig. 1). The mercury within the tube being thus removed from the pressure of the air, while that in the cup is exposed to it, the column falls, till the pressure at the section of the whole, in the same plane as the surface of the mercury in the cup, is the same within and without the tube. A similar experiment is seen when, in a U-shaped tube, having one branch much wider than the other, a column of mercury in the narrow branch balances a column of water nearly 14 times as high in the other. In the Torricellian experiment, the

air and the space occupied by it taking the
the wide water branch of the U-shaped tube,
glass tube and mercury forming the narrow
as before; the narrow branch, however, in
being closed above, to prevent the air from
it were, both branches. In both cases, the
f the columns are inversely as the specific
of the liquids of which they consist; and as
out 10,000 times lighter than mercury, we
ave the aërial column 10,000 times 30 inches
It will be found, under ATMOSPHERE, that
the air lessening in density as it ascends, the
is considerably greater. Any changes that
place in the height or density of the aërial
n will be met by corresponding changes in the
of the mercurial column, so that as the latter
or falls, the former increases or diminishes.
ave, then, in this simple tube, an infallible
of the varying amount of atmospheric pres-
nd, in fact, a perfect barometer. The changes,
er, are indicated on a scale at least 10,000
diminished, so that the variations in the tube
very considerable changes in the weight of the
phere. If water be used instead of mercury,
star column would be 14, or, more correctly,
s as high as the mercurial column, or about
; and the scale on which the changes take
would be correspondingly magnified, so that a
B. should be much more delicate than a mer-
one. Water is, however, exposed to this
objection, that its vapour rises into the empty
above, and causes by its elasticity a depression
column, the depressions being different for
temperatures. At zero, Fahrenheit, for
the depression thus arising would be $\frac{1}{8}$ an
at 77°, more than 1 foot. It would be
wise, at the time of any observation,
ce referred to was filled with vapour
corresponding to the observed exter-
mperature or not, so that the necessary correc-
uld not with certainty be made. The vapour of
ry, on the other hand, at 77° F.—a temperature
erably above the average—produces in the B. a
n of only $\frac{1}{12\frac{1}{2}0}$ of an inch, an amount prac-
mappreciable. After 200 years of experience
avention, we have yet no better index of the
of the atmosphere than the simple mercurial
of Torricelli, and in all exact observations it
as the only reliable standard.

le as the B. is, its construction demands
erable care and experience. It is of the first
tance that the mercury to be used is chemically
otherwise its fluidity is impaired, and the inside
tube becomes coated with impurities in such
as to render correct observation impossible.
ry as usually sold, is not pure; and before being
yed for barometers, must be shaken well with
dilute but pure nitric acid, to remove extra-
metals and oxides. The same object is effected
thoroughly by keeping it several weeks in
ct with the dilute acid, stirring every now
n. After either process, the metal must be
ghly washed with distilled water, and dried.
ing the tube, it is essentially necessary to get
olumn free from air and moisture. To effect
the mercury, after filling, is boiled in the tube,
t air and moisture may be expelled, partly by
eat, and partly by the vapour of the mercury.
process demands great experience and skill,
e same end may be more easily and as effectu-
attained by boiling the mercury, in the first
ce, in an atmosphere of carbonic acid, and then
ng it into the previously heated tube by a filler
ing to the bottom of it. Such care is only
ded on the best instruments; ordinary weather-
s, not needing to be quite accurate, are more
simply filled. Notwithstanding all these precautions, minute bubbles of air manage to keep secreted, and creep up in the course of time into the Torricellian vacuum. To obviate this risk of error, an air-trap is recommended by which any air that may accidentally find its way into the tube is arrested in its ascent to the top, and the instrument sustains no damage from the accident.

Barometers are usually divided into two classes—cistern barometers, and siphon barometers. The simplest form of the cistern B. is that shewn in fig. 1, which only requires to be set properly in a frame, and provided with a scale, to make it complete. Fig. 2 presents another form of that class, being that generally seen in weather-glasses or



Figs. 1, 2, 4, 6, 7.

ordinary barometers. The tube is bent at the bottom, and the cistern is merely an expansion of the lower end. Very generally, the cistern is hidden from view, and protected from injury by a wooden cover in front. There are two causes of inaccuracy in cistern barometers—one being the capillarity, which tends to lower the column; and the other being the difference of level in the cistern caused by the fluctuations in the tube, which renders the readings on the fixed scale above at one time too great, and at another too small, according as this level rises above or falls below the original level from which the scale was measured. The effect of capillarity may be avoided by using tubes of more than half an inch in bore, in which the depression becomes so small, that it may be left out of account; and in smaller tubes it may be estimated from tables constructed for the purpose. Wide tubes have the additional advantage, that atmospheric changes are seen earlier in them than in narrow tubes, there being less friction in the former than in the latter. It is worthy of notice, that the capillary depression is less in boiled than in unboiled tubes, in consequence of the admixture of a minute quantity of the oxide of mercury, formed in the process of boiling, which lessens the repulsion between the mercury and glass. With reference to the error of level, it must be borne in mind that the height of the column sustained by the atmosphere is always to be reckoned from the lower level. This error becomes all the less the larger the capacity of the cistern is compared with that of the tube, for then a very considerable rise or fall in the tube, when spread over the surface of the cistern, makes only a slight difference of level in it.

Care must be taken, then, in ordinary barometers, to make the cistern as large as possible. The only B. in which the error of level is completely obviated, is that invented by Fortin, which, from its being in every respect the most perfect cistern B., deserves particular notice. The cistern, and the lower portion of the tube of this B., is shewn in fig. 3. The cistern is made of boxwood, with a movable leather bottom, *bb*, and a glass cylinder is inserted into it above, all except the glass being encased in brass. In the bottom of the brass box a screw works, on the upper end of which the leather rests, so that by the sending in or taking out of the screw,

Fig. 3.

Fig. 5.

Fig. 8.

the bottom of the cistern, and with it the cistern level of the mercury, can be raised or depressed at will. A small ivory pin, *p*, ending in a fine point, is fixed to the upper frame of the cistern; and when an observation is made, the surface of the mercury is made to coincide with the point of the pin as the standard level from which the barometric column is to be measured. The tube of the B.—the upper part of which is shewn in fig. 4—is enclosed in one of brass, which has two directly opposite slits in it for shewing the height of the column, and on the sides of these the graduation is marked. A brass collar, *cc*, slides upon the tube with a vernier (q. v.), *vv*, marked on it for reading the height with the greatest exactness, and in which two oblong holes are cut, a little wider than the slits in the brass tube. When a reading is taken, the collar is so placed that the last streak of light is cut off by the two upper edges of the holes, or until they form a tangent to the convex mercurial curve. By this means, the observer is sure that his eye is on a level with the top of the column, and that the reading is taken exactly for this point. This is the contrivance usually adopted to prevent the error of parallax, or that caused by the eye being slightly above or below the top of the column, by which the scale and the top of the column are projected too high or too low, the one upon the other, as the case may be. The only other arrangement worthy of mention for effecting the same object is that by Weber, who etches the scale on a piece of silverised glass placed over one side of the tube; and when—the mirror and tube being vertical—the image of the eye appears along with the vertex of the column, the eye is in the same horizontal line with it. Fortin's B. is generally arranged so as to be portable, in which case the screw, *s*, is sent in until the mercury fills the whole cistern, by which the air is kept from entering the tube during transport, the leather yielding sufficiently at the same time to allow for expansion from increase of temperature. It packs in a case, which serves as a tripod when the instrument is mounted for use. On this tripod it is suspended about the middle, swinging upon two axes at right angles to each other, so that the cistern may act the part of a plummet in keeping the tube vertical—the position essential to all correct measurements.

The siphon B. consists of a tube bent in the form of a siphon, having the same diameter at the lower as at the upper end. Fig. 5 represents a simple form of it. The tube travels along the board on which it is placed by passing easily through fixed rings or collars of brass. A scale, divided in inches and parts of an inch, is fixed on the upper part of the board; and when an observation is taken, the tube is adjusted by the screw, *s*, working below it, so that the top of the lower mercurial column may be on a level with the fixed mark, *a*, which is the point from which the fixed scale is measured. In the best forms of the siphon B., both tube and scale are fixed, the latter being graduated upwards and downwards from a zero-point near the middle of the tube, and the height of the column is ascertained by adding the distances from it of the upper and lower levels. The siphon B. is in many respects a more perfect instrument than the cistern barometer. In the first place, the bore at the upper and lower ends of the tube being the same, the depression arising from capillarity is alike for both, and the error from this cause disappears in taking the difference of the heights. In the second place, since the final reading is got from a reference to both upper and lower surfaces, the error in the cistern B. produced by the different capacities of the tube and cistern, is effectually avoided. On the other hand, the taking of two readings, one for each column, is a serious addition to the labour of observation. Gay-Lussac's siphon B. (fig. 6) is bent near the bottom, so as to allow of the lower branch being placed in the same straight line as the upper one—a position highly favourable to accurate observation. When constructed for transport, the tube at the bend is narrowed, as in the figure, to a capillary width, which effectually excludes the air; and when the tube is inverted (fig. 7), being the position in which it is carried, the mercury is nearly all held in the longer branch. Such a tube when mounted, like Fortin's B., makes an excellent travelling instrument, and is comparatively light, from the small quantity of mercury it contains. See ANEROID BAROMETER.

The wheel B., originally invented by Hook, and generally seen as a parlour ornament, has little to recommend it as a trustworthy instrument. Fig. 8 shews the main features of its construction. It is essentially an ordinary B. like the siphon B. below, but having a cistern above, to increase the amount of variation in the lower branch. A small piece of iron or glass, *f*, floats on the open surface, and a thread is attached to it, and passed over a small wheel, *a*, fixed to a horizontal axis, to which it is kept tight by a small weight, *c*, hanging at the other end. A pointer, *p*, is fixed to the other extremity of the horizontal axis, which moves to the right or left of the dial, *dd*, according

as the mercury falls or rises in the lower branch. The great sweep which the index takes, as compared with the comparatively minute variations of the mercurial column, is the only merit of this instrument. It is easy to see, that with so much intervening between the mercury and the index, the chances of error from friction and other causes are very considerable.

The correction of the B. for temperature is of importance. Mercury expands $\frac{1}{5550}$ of its bulk for every degree of Fahrenheit's thermometer; consequently, a column of 30 inches at 32° F., or the freezing-point, would, at 65° F., for instance, be $\frac{5583}{5550}$ times 30 inches, or nearly $\frac{1}{10}$ of an inch longer, for 30 $\frac{1}{10}$ inches of mercury at 60° produce the same pressure as 30 inches of it at 32°. In order, therefore, that all observations may be compared correctly with each other, the observed heights are reduced to what they would be at 32° F. as a standard temperature. The rule for reduction is very simple: Multiply the number of degrees above or below 32° F. by the observed height, divide the product by 9990, and subtract or add the quotient from or to the observed height for the reduced height. Tables for this purpose have been published by the Royal Society, from which the corrections are found at once.

The variations of the B. are found to be both periodical and irregular. Periodical variations are those taking place at stated and regular intervals, and irregular, such as have no regular period of recurrence. The only truly periodical variation is the daily one, which varies from 0·150 to 0·001 inch. In most regions of the globe there is also a well-marked annual variation, widely different for different regions. Accidental variations have a range of about 3 inches. See ATMOSPHERE.

The uses of the B. may be classified into physical, hypsometrical, and meteorological. It is of essential use in all physical researches where the mechanical, optical, acoustical, and chemical properties of air or other gases are dependent on the pressure of the atmosphere. Its use in hypsometry, or the art of measuring the heights of mountains, is very valuable. When a B. is at the foot of a mountain, the pressure it sustains is greater than that which it experiences at the top by the weight of the column of air intervening between the top and bottom. A formula of considerable complexity is given by mathematicians for finding very nearly the true height of a mountain from barometrical and thermometrical observations made at its base and summit, the interpretation of which does not come within the compass of this work. The following rules give very nearly the same result: 1. Reduce the mercurial heights at both stations to 32° F. 2. Take the logarithms of the corrected heights, subtract them, and multiply the result by 10,000, to give the approximate height in fathoms of the upper above the lower station. 3. Take the mean of the temperature at both stations, take the difference between this mean and 32, multiply the difference by the approximate height, and divide the product by 435. This last result is to be added to the approximate height, if the mean temperature is above 32, and subtracted, if below, to find the true height in fathoms. A Fortin's or Gay-Lussac's B. is employed in measuring heights.

The best known use of the B. is as a meteorological instrument, or as a weather-glass. Opticians have attached to certain heights of the B. certain states of weather, and at certain points of the scale the words 'Rain,' 'Changeable,' 'Fair,' &c., are marked; but the connection thus instituted is very misleading. Those who have observed most carefully the connection of barometric heights with changes of the weather, discard entirely the use of these terms, and state that it is not the actual height of the B. at any place, but this height as compared with that of surrounding regions which indicates the coming weather. Several elaborate codes of rules have been drawn up to serve as a key to the variations, but as these are more or less of a local character, they would be out of place here. Generally speaking, a falling B. indicates rain, a rising B., fair weather. A steady B. foretells a continuance of the weather at the time; when low, this is generally broken or bad, and when high, fair. A sudden fall usually precedes a storm, the violence of which is in proportion to the barometric gradient. An unsteady B. shews an unsettled state of weather; gradual changes, the approach of some permanent condition of it. The variations must also be interpreted with reference to the prevailing winds, each different wind having some peculiar rules. The connection between changes of weather and the pressure of the atmosphere is by no means well understood. One reason is given, which may to some extent account for the B. being lower in wet than in dry weather - viz., since, as has been shewn by Dalton, moist air is lighter than dry air, so long as there is much aqueous matter in the air in the form of elastic vapour, the barometric column will read relatively low. Hence much depends on the nature of the winds. The south and south-west winds, which are, in Western Europe, more than any other, the rain-bringing winds, are warm and moist winds. Now, a column of such air, to be of the same weight as one of cold dry air, must be higher; but this it cannot well be in the atmosphere, for no sooner does the warm moist column, by its lightness, rise above the surrounding level of the upper surface of the aërial ocean, than it flows over, and becomes nearly of the same height as the cold air around it. The interchange taking place less interruptedly, and consequently less slowly, in the higher strata than in those near the ground, it is some time before the equilibrium thus disturbed is restored, and meanwhile the B. keeps low under the pressure of a rarer atmospheric column. On the other hand, the northerly and easterly winds, being comparatively cold and dry, are accompanied with fair weather and a high barometer. It is thus to the warmth, as well as to the moisture of these winds that the low pressure is to be ascribed. Hence, then, the rain attendant on a low B., as well as the fine weather accompanying a high B., are the necessary concomitants of our geographical position – of our having the land to the east, and the ocean to the west of us. In Great Britain a high and rising B. frequently accompanies east winds with a drenching drizzle; and on the La Plata River, things are the reverse of what they are with us; there the cold south-east wind, coming from the ocean, brings rain with a high barometer, and the land winds, warmed by the plains of South America, maintain fine weather with a low barometer. That the temperature, as well as the moisture of the air, is at least an important cause of the changes of the B., is also shewn by the fact, that, in the tropics, where the variations of the temperature are slight compared with the temperate zones, the B. experiences almost no change. In Central Asia, the summer pressure is nearly an inch less than that of winter, and at Dendiquin, towards the interior of Australia, it amounts to 0·250 inch.

BAROMETZ, or Tartarian or Scythian Lamb, the prostrate stem (rhizome) of a fern (*Cibotium Barometz*) which grows in the salt-plains near the Caspian Sea. It is shaggy with a silky down, and has a sort of general resemblance to an animal. In the days of ignorant credulity, when the story of the phœnix was received as a truth of

natural history, and barnacles were believed to grow into geese, and horses' hairs into eels, marvellous tales were told of the B., which was supposed to partake of the natures of a plant and an animal, to grow on a stalk, and eat grass like a lamb, &c. Erman (*Travels in Siberia*) supposes that the fables regarding the B. may have some connection with the cotton plant.

BARON. This term, as to the origin of which much difference of opinion exists, is probably derived from the Latin word *baro* (allied to *vir*, a man, a hero), which originally signified a stupid, brutal man, afterwards came to signify a man simply, and latterly, by one of those strange transmutations which are not uncommon in language, a man pre-eminently, or a person of distinction. Teutonic, Celtic, and even Hebrew derivations have also been assigned to the word; but the fact of its having been introduced into this country by the Normans, seems in favour of a Romanic origin. It is now the title which we apply to the lowest degree of hereditary nobility. The degree of B. forms a species of landing-place, corresponding amongst noblemen, in a certain sense, to that of gentleman, at a lower stage of the social pyramid. It was in this sense that the word was used in former times to include the whole nobility of England, because all noblemen were barons, whatever might be the higher ranks in the peerage which they occupied. The word peer has recently come to be used with the same signification, perhaps because it is no longer necessarily the case that every nobleman should be a B., there being instances in which earldoms and other honours have been given without a barony being attached to them, and in which the barony has been separated from the higher degree by following a different order of descent. The general theory of the constitution, however, still is, that it is as barons that all the peers sit in the upper house; and it is on this ground that the archbishops and bishops are said to sit in virtue of their baronies. The distinction into *greater* and *lesser* barons seems from an early period to have obtained in most of the countries of Europe. The greater barons, who were the king's chief tenants, held their lands directly, or *in capite*, as it was called, of the crown; whilst the lesser held of the greater by the tenure of military service. The greater barons, who corresponded to the *Freiherren* (free lords) of Germany, had a perpetual summons to attend the great councils of the nation; whereas the latter were summoned only in case of their lands embracing a certain extent, which in England was thirteen knights' fees and a quarter. See KNIGHT'S FEE. When the representation of the middle class in England came to be confided to the knights of the shire and burgesses of towns, the minor barons ceased to receive the royal summons, and by degrees the title B. came to be applied to the greater barons, or lords of parliament, as they were called, exclusively. For an account of the barons of England immediately after the Conquest, and of the lands which they held, see DOOMSDAY-BOOK. The habit of conferring the rank of B. by letters-patent, by which it was converted into a mere title of honour, apart from the possession of landed property or of territorial jurisdiction, was first introduced by King Richard II., who, in 1388, created John Beauchamp, of Holt Castle, B. of Kidderminster. In Germany, the old barons of the empire were for the most part raised to the dignity of *grafs* (counts) and princes; whilst the lesser, in place of passing into the ranks of the untitled gentry, as in England, constituted a grade of the lower nobility, to which no duties were assigned, and scarcely any political privileges belonged.

When a B. is summoned to the House of Lords by writ, a letter, in the sovereign's name, directs him to repair to the parliament, to be holden at a specified time and place, to advise with his sovereign, the prelates, and nobles, about the weighty affairs of the nation. On the arrival of the new peer, he is presented by two barons to the lord-chancellor, his patent or writ being carried by a king-at-arms. This having been read by the chancellor, he congratulates him on becoming a member of the House of Peers, and invests him with his robe. The oaths are then administered by the clerk of parliament, and the new B. is conducted to a seat on the barons' bench. In addition to barons by writ and barons by patent, barons by prescription are usually mentioned, but incorrectly according to Blackstone, who remarks that 'those who claim by prescription must suppose either a writ or patent made to their ancestors, though by length of time it is lost.' (Kerr's Ed., vol. i. p. 406.) There are some distinctions between a creation by writ and by patent which ought to be mentioned. 'The creation by writ,' says Blackstone, 'is the more ancient way, but a man is not ennobled thereby, unless he actually takes his seat in the House of Lords; and some are of opinion that there must be at least two writs of summons, and a sitting in two distinct parliaments, to evidence an hereditary barony.' In consequence of the inconvenience thus attending it, the creation by writ may now be considered as obsolete, although the eldest son of a peer is still frequently called up to parliament by means of it, there being in that case no danger of the children losing their nobility even should their father never take his seat. But though creation by patent is thus in general the surest way of insuring the hereditary character of the peerage, it labours under one disadvantage as compared with a creation by writ—viz., that whereas in the latter case the dignity once insured by possession, passes to the heirs of the holder without any words to that purpose, in the former there must be words to direct the inheritance, else the dignity endures only to the grantee for life. Where the patent, again, in place of being silent as to the succession, expressly sets forth that the dignity is for life merely, it was held, in the Wensleydale case, that it does not make the grantee a lord of parliament at all.

The coronation and parliamentary robes of a B. differ very slightly from those of an earl. The right of wearing a coronet was conferred on barons for the first time by King Charles II.; their head-dress till then having consisted of a cap of crimson velvet, lined with ermine, and having a plain gold band. A baron's coronet is adorned with six pearls, set at equal distances on the chaplet. Coronets are worn only on great occasions of state ceremonial. In ordinary garb, there is nothing to distinguish a B. from a commoner. A B. has the title of 'Right Honourable Lord,' &c., and is addressed as 'My Lord,' or 'Your Lordship.' His wife has also the title of 'Right Honourable,' and is addressed as 'Madam,' or 'Your Ladyship.' A B., in signing, sinks his Christian and family surname, and subscribes his titular designation. His children enjoy the prefix of Honourable, as the 'Honourable Mr'—mentioning Christian and surname. In literature and conversation, a deceased B. is referred to by his Christian name, according to his number in the list of peers of the same title, as 'Henry, eighth baron.'—The Barons of Exchequer (q. v.) and of the Cinque Ports (q. v.) are examples still existing of the ancient barons by office.

Baron's Coronet.

In the United Kingdom, there are persons who

possess the title of B. in parted by some foreign power; as, for example, 'Baron Rothschild.' No such honour can be legally enjoyed without the consent of the sovereign; but at best the title is only honorary, and communicates no special privileges. A good article on the Baronage will be found in the *Cyclopædia of Political Knowledge*, published by Bohn, London, 1853. See PEER.

BA'RON AND FEME, or FEMME. These are two Norman-French words used in English law-books to denominate HUSBAND AND WIFE (q. v.); and see MARRIAGE.

BA'RON AND FEMME, in Heraldry, is the expression used to designate the bearing by which the arms of husband and wife are carried per pale, or marshalled side by side on the same shield. The husband's arms are always carried on the dexter side. Where the wife is an heiress—i. e., the representative of her father's house—her husband carries her arms, not *per pale*, but in a shield of pretence; and they are quartered with the paternal coat by the issue of the marriage.

BA'RON OF BEEF, a large piece of beef, consisting of both sides of the back, or a double sirloin, and weighing, according to the size of the animal, from 50 to 100 lbs. This monstrously large piece of beef, roasted, is served only on particular festive occasions at the English court, and at great public entertainments. When served according to ancient custom at civic feasts in Guildhall, London, the B. is honoured with a distinguished place on a kind of elevated rostrum, where it is ceremoniously carved for the assembled guests. The term B. probably originated in a fanciful allusion to the word sirloin; inasmuch as a *baron* is superior in rank to a *sir*.

BA'RONET. This title, which is the diminutive of baron, is the lowest degree of hereditary honour in the United Kingdom. Baronets were instituted, for the first time, by King James I., on the 22d May 1611. The ostensible object was to promote the plantation of Ulster, in Ireland, with English and Scottish settlers; but the real aim was to raise money. Each B. was bound to maintain 30 soldiers in Ireland for 3 years, at the rate of 8*d*. per diem for each man; the wages of one whole year to be paid into the exchequer on the passing of the patent. The sum thus exacted, with the fees of honour due to the officers, amounted to upwards of £1000 on each patent. It is a striking proof of the passion for hereditary distinction, that 200 persons were willing to accept the honour on such terms. It was part of the bargain that no title should be created between a B. and a baron, and that the number of the former should be permitted to diminish as the families of the original 200 died out, thus enhancing the value of the title to those that remained. But the latter stipulation was very speedily departed from, and a new commission was appointed to fill up the vacant places, and even to treat with new applicants. Such was the origin of English baronets. From the date of the Union, in 1707, those created in England and Scotland were baronets of Great Britain. Irish baronets were created until 1800, since which period all baronetcies are of the United Kingdom. There is no limit to the creation of baronets but the will of the sovereign. At investiture there is no ceremony. The rank is communicated by patent or writ, issued under authority of the crown; the fees of office being considerable. There are differences in the terms on which the honour descends (suggested, perhaps, by the recipient according to family circumstances). Sometimes, according to the patent, the rank is confined to direct heirs-male; sometimes it embraces heirs-male collateral; and sometimes, in default of direct male heirs, it passes to the husbands of heirs-female. For the style and privileges of Baronets, in matters of ceremony, see Burke's *Peerage and Baronetage*. Baronets have precedence of all knights, except those of the Garter, bannerets made under the royal banner in open war, and privy-councillors. They are entitled to have *Sir* prefixed to their name, along with B. as an affix. The wife of a B. is legally styled *Dame*; but in common speech she is called Lady, and addressed as 'Your Ladyship.' The rank of B. does not raise a person above the degree of commoner; but many baronetcies have, in course of time, been heritably acquired by peers, which lessens the ostensible number.

Baronets of Scotland and Nova Scotia originated in a project of James I.; but were not instituted till 1625, by Charles I. The professed object was to encourage the settlement of Nova Scotia in North America; and a grant of a certain portion of land in that province, to be held of Sir William Alexander, afterwards Earl of Stirling, who was then his majesty's lieutenant in Nova Scotia, actually accompanied the title—the grants of land being of course illusory, for their very designations were a fiction. The first person who received the honour of a Nova Scotian baronetcy was Robert Gordon of Gordonstone, a younger son of the Earl of Sutherland, whose patent bears date May 28, 1625. There are no new additions to this branch of the baronetage; the latest creation having been in 1707, the year of the Union of Scotland and England. In point of title and popular recognition, there is no distinction between these and other baronets.

BARO'NIUS, CÆSAR, an eminent Roman Catholic ecclesiastical historian, born at Sora, in Naples, on the 30th October 1538, and educated at Naples and Rome. He was one of the first pupils of St Philip Neri, who founded the congregation of the Oratory, of which B. became superior in 1593. He soon after became Father Confessor to the Pope, Apostolical Prothonotary, and finally, in 1596, Cardinal, and Librarian of the Vatican Library. On the death of Clement VIII., in 1605, 30 voted in conclave for the election of B. as Pope; and but for the opposition of the Spaniards, who were indignant at him for his treatise *De Monarchia Siciliæ*, in which he argued against Spain's claim to that country, he might have been elected. The controversy against the work called the *Magdeburg Centuries* (q. v.), which had already been weakly attempted by Muzio in 1570, seemed at that time the most important undertaking for the learning of the Church of Rome. B. entered upon this controversy with great energy and in a position most favourable for access to authorities, composing his *Annales Ecclesiastici a Christo nato ad ann.* 1198 (12 vols., Rome, 1588–1607), in which work he laboured till his death, 30th May 1607. As his object was to prove that the Church of Rome has not departed in doctrine or constitution from the Christian Church of the 1st c., B. has been accused of not using his authorities according to their proper historical sense, but artfully concealing, obscuring, and falsifying many things—sometimes, perhaps, from ignorance of the Greek, but more frequently with design. His *Annals* have been frequently reprinted, but the reprints are often incorrect and incomplete. The most recent, provided with copious notes, &c., and containing Pagi's *Critical Examination* and Rinaldi's continuation, although not yet entirely correct, is the edition of Mansi (43 vols., 1738—1757). The *Critica in Annales Ecclesiasticos Baronii* of Anthony Pagi, the Franciscan (4 vols., Antwerp, 1705, improved by Francis Pagi, Antwerp, 1724), corrects B. in many points, especially of chronology. Among the continuations of the *Annals*, all of

which are inferior in value to the work itself, the most rich in matter are that of Bzovius, extending to 1572 (9 vols., Rome, 1616—1672), and that of Rinaldi (10 vols., Rome, 1646—1677), who availed himself of the materials left by B., for the period from 1198 to 1571. Amongst the other works of B., his publication of the *Martyrologium Romanum* deserves to be noticed (Rome, 1586, and repeatedly).

BARONS OF THE EXCHEQUER. See EXCHEQUER, BARONS OF; COMMON LAW; COURTS OF COMMON LAW; REVENUE.

BARONY is, or, it may rather be said, was a manorial and hereditary right arising out of land, known to the law both of England and Scotland. In England, manors were formerly called baronies. In the Scotch law, a right of B. is a right in relation to lands which have been erected, or at least confirmed by a clause in crown-charters making the grant *in liberam baroniam*, as it is called; and by the crown alone could such a right be conferred. It involved a civil and criminal jurisdiction to which, in theory, all the inhabitants of the B. lands were amenable. But such jurisdiction has, by modern legislation, been so limited and obstructed as scarcely ever to be exercised; and, indeed, in regard to the right of B. itself, the clause in crown-charters erecting baronies has, since the abolition of heritable jurisdictions by the 20th Geo. II. c. 43, become obsolete. But by the 35 Geo. III. c. 122, they are permitted on the sea-coast for encouragement of fisheries, and the bailies thereof (see BAILIE) are to have the powers of justices of the peace. In England, the lord or baron of the manor may hold his COURT BARON (q. v.; see also MANOR, JURISDICTION).

BARO'SMA. See BUCKU.

BARQUE, or BARK, is a name frequently given to ships, but with no very definite meaning. Sometimes it denotes simply a ship of small size; sometimes a broad-sterned vessel without a figure-head;

Barque.

but more technically it applies to three-masted vessels whose mizzen-sails are fore-and-aft instead of being square. An *armed B.* is one variety of a special sort of vessel noticed in another article. See ARMED SHIP.

BARR, or BA'RRA, a petty Mandingo kingdom of Western Africa, at the mouth of the Gambia, with an estimated area of about 250 square leagues, and a population of 200,000, the males being remarkable for their fine proportions. The surface, which is fertile, but rather marshy, is well cultivated.

BA'RRA, a pleasant suburban town about 3 miles east of Naples, with a population of 12,000. It has numerous fine country residences.

BA'RRA, a small island near the south extremity of the Hebrides, Scotland, belonging to Inverness-shire, and 42 miles west of Ardnamurchan. Its lat. of Barra-head, 56° 48′ N., long. 7° 8 miles long, and 2 to 4 broad, with steep the sea. A low sandy isthmus, over which nearly breaks at high water, connects the t into which B. is divided. The south contains a rocky mountain, 2000 feet l divided into small valleys. The is of gneiss. The soil is sandy, but are fed on the hill and meadow p 1624, chiefly Roman Catholics, spe with great purity; and among the mos of Scottish fishermen. Their boats are and aft, and are built by the fishermen who engage extensively in the cod, li and shell-fish fisheries. 200 horse-loads (cockles, limpets, muscles, razor-fish, lobsters, etc have been taken off the sands in one day dur summer spring-tides. The light-house on head, the loftiest in Britain, is 680 feet above sea, and is seen 33 miles off.

BARRACKPO'RE, a native town and cantonment on the left or east bank of and 16 miles up the stream from Calc 22° 46′ N., and long. 88° 26′ E. On account of salubrity of its air, B. is a favourite retreat Europeans from Calcutta, the governor-gen having here his country residence. In fact, appears to have long enjoyed this kind of distinction; Mr Job Charnock, the founder of having erected a bungalow here as 1689. In 1857, B. became famous as the formidable mutiny or rebellion to Several regiments of native troops were Barrackpore. The men objected to bite of the cartridges for the Enfield rifle, beca paper to be polluted by animal fat. The connected herewith—a mere prelude to the outbreak at Meerut in May—commenced ab beginning of February, and continued to a various degrees of intensity, till at last two ments of Bengal native infantry had to be disb —the 19th, on 31st March; and the 34th, on It was in the last-named corps that the first would appear to have been drawn, an intrepid sepoy having attacked and wounded Lieutenant Baugh, with sword and fellow, whose name was Mungal Pandy, to have had the equivocal honour of local designation of Pandies to the insurgents.

BARRACKS are permanent structures for accommodation of soldiers, as distinguished huts and tents. Originally, the word, derived the Spanish *barracas*, applied to small cabins huts; but in England, the term is now also considered to relate to structures of brick or sto Great opposition was made in this country to introduction of permanent B. during the early of the last century, on the ground that the of the subject might possibly be ex thus separating the soldiery so comple citizens, and placing them in the h power. On the other hand, it was the older system of billeting the s people is vexatious and burdensome: morals of towns-people and villagers vitiated by the constant presence o permanent B. were few in numb year 1792, when George III. ob sent of parliament for the con new ones, and for the found barrack-master-general. Vari. arrangements were made

iture for B., in building, rebuilding, enlarging and repairing, between 1793 and 1804, was 000; between 1804 and 1819, £3,220,000; tween 1819 and 1859 (including Aldershott wards of £7,000,000. It has been found, on ial examination, that in 17 B., constructed n 1832 and 1857, the cost varied from £27 to er soldier accommodated, according to the ss of the work, and to the inclusion or exclumess-rooms and quarters for the officers.

condition of British soldiers has, ever since sters in the Crimea in the winter of 1854, n object of much public solicitude. This de was so strongly expressed as to break a the cold formalities of the official depart-

Returns were ordered, and commissions and s appointed, partly to inquire into existing ssly to suggest improvements. The Barrack-General was replaced at the beginning of ntury by Commissioners for Barracks, whose ns were absorbed by the now extinct Board nance in 1822. Barracks are now under the ision of the Surveyor General of the Ord who provides for their construction and nance through the Royal Engineers; and for rictualling and daily service through Comies of the Control Department. Under these saries are barrack-clerks and barrack-sertto assist them in the duties. The furniture B. is bought by the War Office. The French singular plan of *hiring* such furniture at 15 per man per annum; the English cost is 25s. per man, and some of our officers are of that it might with advantage be superseded French plan. The barrack-rooms have arm coutrement racks, shelves, and pegs; with a order for depositing everything thereon; the day, all the bedding is placed in exact as well as dishes, tins, and canteens. A ern officer visits every room every day. The steads are turned down every evening, and ry morning. One non-commissioned officer nt or corporal has control over each room, responsible for quiet, cleanliness, &c. Marmen, in the ratio of 6 to a company of 100 s, may live in the B. with their husbands, arate rooms known as 'Married Soldiers' rs,' but not unless the marriage has been nsent of the commanding officer. The soldier may, however, sleep out of B., and ved an extra 2*d.* per day if he does so. Each in a barrack has an iron bedstead, a rug, a se, a bolster, two blankets, and two sheets; is nothing for these. Each soldier has his and number written near his bed and knap-

withstanding the order and regularity established in B., committees of inquiry appointed in nd 1857 ascertained the existence of grievous . It was found that, out of 252 B., only 20 parate sleeping-rooms for married soldiers; ves of such soldiers, in the other 232, being l to put up with arrangements repugnant to ency and propriety, or else sleep away from altogether.

egard to sanitary arrangements, great efforts seen made at vast cost in recent years to e all the hygienic conditions, such as drains, ation, means of ablution, recreation, circulair, &c. The result has been very apparent ced rate of mortality. Army-physicians mend 600 cubic feet of room space per soldier; is the standard now demanded in all able cases by the War Office. It has been ted that a new barrack for 1000 foot guards in would cost £150,000, *besides land*, the cost of which would depend wholly on the particular site selected. The necessity for grounds for exercises, stores, surgery, offices, &c., renders a barrack a very costly congeries of buildings. Twenty acres may be taken as the minimum space needed for 1000 men. In relation to all the various subjects of barrack-life, a committee of military officers has drawn up a most comprehensive scheme of reform; but unfortunately the cost of making these improvements would be so enormous, that nothing better than a very gradual adoption can be expected.

The finest existing B. in this country are perhaps those at Aldershott, attached to the camp noticed in another article. See ALDERSHOTT CAMP. The buildings extend in two long lines, branching out of the Farnborough and Farnham road, with a large parade-ground between them. The infantry and artillery B. are on the north side of this space, and the cavalry B. on the south. The infantry B. are divided into blocks, forming each a spacious quadrangle, with a courtyard in the centre. Each block is a complete barrack for a full regiment, with all the men's rooms, store rooms, school rooms, officers, &c. The officers' rooms are, however, separate, and occupy open spaces between the blocks of buildings. All the four sides of each quadrangle are occupied by various rooms and buildings; the men's living and sleeping rooms being mostly on the side next to the parade ground. The sleeping rooms, each for 24 men, are very large and airy; the washing-rooms are ample and well fitted; and the cooking-rooms will each cook for 350 men. Dry play-grounds and drill-yards, under glass roofs, are provided. A broad balcony outside every range of sleeping-rooms enables the soldiers to look out upon these grounds. The married soldiers and their wives are comfortably provided for, in rooms wholly apart from the rest. The artillery and cavalry B. resemble in their general features those for the infantry.

By the Military Forces Localisation Act of 1872, £350,000 is to be raised and expended in building and altering barracks for the 70 sub-district brigades among which the infantry is now to be divided.

BARRACOON, the appellation given to a depôt for newly captured slaves on the coast of Africa, and where they remain under restraint until carried off by vessels in the slave-trade.

BARRADA, or **BURADA**, a river of Syria, which rises in lat. 33° 50′ N., long. 36° E., flows in a south-south-east direction towards Damascus, above which it divides, one branch being diverted to irrigate the city and its gardens, while the other passes on the north side. The branches, which it is supposed were the *Pharpar* and *Abana* of Scripture, afterwards unite, and flow into the marshes and Lake of Bahret-Merj.

BARRAFRANCA, a town of Sicily, in the district of Piazza, about 10 miles south-east of Caltanisetta, with a population of about 6000.

BARRAS, PAUL-JEAN-FRANÇOIS-NICOLAS, COUNT DE, a distinguished character of the French Revolution, was born at Fox, in Provence, 30th June 1755. In his youth he served as a lieutenant against the British in India, and after his return home, wasted his property in Paris in dissipation. He eagerly joined the revolutionary party, and was a deputy of the *Tiers Etat* in the States-general in 1789. He was actively concerned in the storming of the Tuileries, was appointed administrator of the department of Var, and afterwards of the county of Nice. In the Convention, he voted for the execution of the king without delay or appeal, and on the 31st May 1793 declared against the Girondists. The siege of Toulon, and triumph of the

revolutionary party in the south of France, were in a great measure owing to his activity and energy; and after the victory, he was deeply concerned in all the bloody measures which were adopted. Yet he was hated by Robespierre and the Terrorists, as one of the less decided revolutionists; and their overthrow was accomplished mainly by him, the Convention appointing him commander-in-chief, and virtually investing him with the dictatorship for the time. While holding this high office, in which he acted with great decision and vigour, and on the same day on which Robespierre fell, he paid a visit to the Temple, and provided for the better treatment of the king's son; he hastened also to the Palais de Justice, and suspended the execution of a large number of persons who had been condemned to death. On subsequent occasions, he acted with decision both against the intrigues of the Royalists and the excesses of the Jacobins; and on 13th Vendemiaire (5th October 1795), being again appointed commander-in-chief by the Convention, he called his young friend Bonaparte to his aid, and crushed the sections with merciless discharges of artillery. The Directory being appointed in November 1795, B. was nominated one of the five members, and in this capacity he procured the nomination of Bonaparte as commander-in-chief of the army in Italy. It was he who arranged the marriage of Bonaparte with the widow Beauharnais. On 18th Fructidor (see FRANCE, HISTORY OF), he was again invested with the dictatorship, and was again victorious. His authority now became preponderant in the Directory, and he affected the pomp of a king, and began to give splendid entertainments in the palace of the Luxembourg. This continued for about two years till the decline of the power of the Directory. After 30th Prairial, Sièyes and he had the whole executive power in their hands; and whilst B. secretly negotiated, it is said, with the Bourbon princes, demanding a large reward for their restoration, Sièyes, in secret understanding with Bonaparte, brought about the revolution of 18th Brumaire. Notwithstanding the favours he had formerly conferred on Bonaparte, he was now, perhaps unavoidably, an object of suspicion to him, was compelled to remove from the neighbourhood of Paris, resided in Brussels, then in Marseille, was banished to Rome, and thence sent to Montpellier, being kept under constant surveillance of the police, and actually found to have been engaged in conspiracies for the restoration of the Bourbons. After the Restoration, he returned to Paris, and purchased an estate in the neighbourhood of it, where he died on 29th January 1829. He had acquired a considerable fortune in the Revolution. His Memoirs, which must be of historic importance, were seized by the government.

BA'RRATRY, COMMON, or, as it is called in old English law-books, *Barretry*, is the offence of inciting and stirring up suits and quarrels among the queen's subjects. *One* offensive act of the kind is not sufficient in order to maintain an indictment for this offence; but it must be shewn that the party accused *frequently*, or at least on more than *one* occasion, conducted himself in the way imputed; and therefore the principle of the law appears to strike at the *habit* or *disposition* of evil-minded persons, who would incite to quarrelling, or busy-bodies, as they are in fact called in old law-reports; who, to use a familiar expression, 'set people by the ears.' This term is supposed by some to be derived from the French word *Barrateur*, which signifies a deceiver; by others, from the Latin word *Barrator*, a vile knave. Some, again, account for it by the suggestion that it is made up of *Barra*, the bars of courts of justice, and *Retum*, an old word signifying an offence; while, by other antiquarian lawyers, it is supposed to have been borrowed from the Normans; the Anglo-Norman *barat* signifying a quarrel or contention. In old English indictments, charging this offence, the accused is not only described as *pacis domini regis perturbator*, but also *oppressor vicinorum suorum*; that is, he who is guilty of B., is not only a disturber of the public peace, but a nuisance to his neighbours. The punishment for this offence is fine and imprisonment; but if the offender belongs to the profession of the law, as is too frequently the case, he may besides be disabled from practising his profession for the future. And, indeed, it is the existing statute law of England, that if any one who has been convicted of B. shall practise as an attorney, solicitor, or agent in any suit, the court, upon complaint, shall examine the matter in a summary way; and if the fact of such conviction be proved, may direct such offending attorney, solicitor, or agent to be kept in penal servitude for not more than seven or less than three years.

Akin to this offence is another of equal malignity and mischief; namely, that of suing another in the name of a fictitious plaintiff. If committed in any of the superior courts, this offence is treated as a high contempt, punishable at discretion, and in inferior courts, by six months' imprisonment, and treble damages to the party injured.

B., in the sense above explained, is not a technical term in the law of Scotland. But in that system there is a word *Baratry*, which is defined as the crime committed by a judge who is induced by a bribe to pronounce a judgment, or who barters justice for money.

There is also *Baratry of Mariners*, which signifies —in the law not only of England and Scotland, but also of France and other European states—the fraud of the master or mariners of a ship tending to their own advantage, but to the prejudice of the owners. Such conduct, however, is one of those risks which are usually insured against in marine policies of insurance. See MARINE INSURANCE.

BA'RREL (It. *barile*; Fr. *baril* = *barrique*, primarily, a large vessel for holding liquids—probably from *bar*, in the sense of to guard, confine, contain—and then a certain *measure*, but varying in every locality, and almost for every liquid. In the old English measures, the barrel contained 31½ gallons of wine, 32 of ale, and 36 of beer—the wine gallon itself differing from that of ale and beer. In imperial gallons, their contents would be: old wine barrel = 26¼ gal.; ale do., 32¼; beer, 36¼. The Italian barile varies from 7 to 31 English gallons; the French barrique of Bordeaux = 228 French litres = 50 English gallons. Four barriques make a tonneau. In many cases, *B.* signifies a certain *weight* or other quantity of goods usually sold in casks called barrels. In America, flour and beef are sold on the large scale in barrels: a B. of flour must contain 196 lbs.; of beef, 200 lbs. A B. of butter = 224 lbs.; of soft soap, 256 lbs.; of tar, 26½ gallons.

BA'RREL, GUN. The relation which the barrels of small-arms bear to the stock, lock, and other parts, is described in such articles as MUSKET, PISTOL, RIFLE, REVOLVER, BREECH-LOADING ARMS, &c.; but the remarkable processes of manufacturing these barrels may be briefly noticed once for all.

The iron for all good musket-barrels contains a portion of steel, or undergoes some kind of *steeling* process. Horseshoe nails or stubs, after much violent usage, yield a very tough kind of iron when re-heated; and English gun-makers have been

accustomed to buy such refuse on the continent; but the foreign makers now use the old nails themselves; and Birmingham puts up with those of English make, which are inferior in quality. The best barrels are now made in England of laminated, twisted, and Damascus steel. To prepare *laminated steel*, Mr Greener, a celebrated Birmingham gunsmith, collects scraps of saws, steel-pens, files, springs, and steel-tools, from the various workshops; cuts them into small and nearly equal pieces; cleans and polishes them by revolving in a cylinder; fuses them into a semifluid state; gathers them into a 'bloom' or mass; forges this bloom with a three-ton hammer; hardens and solidifies it with a tilt-hammer; rolls it into rods; cuts each rod into pieces six inches long; welds these pieces together; repeats the rolling, cutting, and welding several times; and thus, finally, brings the metal into a very hard, tough, fibrous, and uniform state. *Twisted steel* for barrels is made by taking thin plates of iron and steel, laying them alternately one on another in a pile, welding them by heat and hammering, and twisting them by very powerful mechanical agency, until there are twelve or fourteen complete turns to an inch; the length becomes reduced one-half, and the thickness doubled, by this twisting. *Damascus steel* barrels are made of steel which has undergone a still further series of welding and twisting operations. *Stub Damascus* barrels are made of a mixture of old files with old horse-nails; the files are heated, cooled in water, broken with hammers, and pounded in a mortar into small fragments; three parts of these fragments are mixed with five of stub; and the mixture is fused, forged, rolled, and twisted. An inferior kind of Damascus-twist is made by interlaying scraps of sheet-iron with charcoal, and producing an appearance of twist, but without the proper qualities. *Threepenny-skelp* and *Twopenny-skelp* are inferior kinds of barrel-iron; and the worst of all is *sham-damn skelp*, of which gun-barrels are made for hawking at a cheap price at country-fairs, and for barter with the Indians in fur-hunting countries.

The gun-barrel manufacture of England is now almost wholly conducted at Birmingham and at Enfield, very few barrels being made elsewhere. The best barrels are all twisted into form. The skelps, or long strips of prepared steel, are twisted into a close spiral a few inches long; several of these spirals are welded end to end; and the fissures are closed up by heating and hammering. The rough barrel, with a core or mandril temporarily thrust in it, is placed in a groove, and hammered cold until the metal becomes very dense, close, strong, and elastic. The interior is then bored truly cylindrical by a nicely-adjusted rotating cutting-tool. If, on narrow inspection, the interior is found to be straight and regular, the exterior is then ground on a rapidly revolving stone, and finally turned in a lathe. Commoner barrels are not twisted: the skelps are heated, laid in a semi-cylindrical groove, hammered till they assume the form of that groove, placed two and two together, and heated and hammered until one B. is made from the two halves. See PROOF.

Common barrels are browned externally with some kind of chemical stain; but the best are rubbed with fine files, and polished with steel burnishers.

BA'RREL-BULK, a term denoting a measurement of 5 cubic feet, used chiefly in the coasting-trade.

BA'RREL-ORGAN. An organ (q.v.) in which the music is produced by a barrel or cylinder, set with pins and staples, which, when driven round by the hand, opens the valves for admitting the wind to the pipes according to the notes of the music. The number of tunes that any one instrument can play is, of course, very limited. Barrel-organs are generally portable, and mostly used by street-musicians. A street-organ costs from £30 to £70, according to size. The most perfect barrel-organs are those which are driven by a motive-power, of which the best are made in Vienna, and cost from £100 to £300. The Orchestrion, made by Kaufmann in Dresden, is a large self-acting barrel-organ. See ORCHESTRION.

BARRHEAD, a town of recent growth in the east part of Renfrewshire, 6 miles south-west of Glasgow. It has cotton-mills, and bleaching and print works. Pop. (1871) 6209.

BARRICADES are defence-works employed both in the military and naval services. Military engineers, and sappers and miners, are instructed in the art of barricading streets and roads with beams, chains, *chevaux-de-frise*, and other obstacles, either in defending a town against besiegers, or in suppressing popular tumults. In a ship, a strong wooden rail, supported on stanchions, and extending across the foremost part of the quarter-deck, is called a barricade; during a naval action, the upper part of this barricade is sometimes stuffed with hammocks in a double rope-netting, to serve as a screen against the enemy's small-shot. B. have been made use of in street fights since the middle ages, but they are best known in connection with the insurrections in the city of Paris. As early as 1358, the streets of Paris were barricaded against the Dauphin, afterwards Charles V. A more noteworthy barricade-fight was that in 1588, when 4000 Swiss soldiers, marched into Paris by Henry III. to overawe the Council of Sixteen, would have been utterly destroyed by the populace, firing from behind B., had the court not consented to negotiation; and the result was, that the king fled next day. The next barricade-fight of importance in Paris was that of 1830, which resulted in the expulsion of the Bourbons from the throne of France, and the election of the citizen king, Louis Philippe. During the three days which this revolution lasted, the number of B. erected across the streets amounted to several thousands. They were formed of the most heterogeneous materials overturned vehicles, trees, scaffolding-poles, planks, building-materials, and street paving-stones, men, women, and children taking part in their erection. In February 1848, the insurrection against Louis Philippe commenced with the erection of B.; but the most celebrated and bloody barricade-fight was that between the populace and the Provisional Government, which, commencing on the night of the 23d June 1848, lasted throughout the three following days, when the people had to surrender. The national losses by this fight were estimated at 30,000,000 francs; 16,000 persons were killed and wounded, and 8000 taken prisoners. The Emperor Napoleon III. has so widened and macadamised the principal streets of Paris since he ascended the throne, as to render the successful erection of B. next to impossible. There was a remarkable barricade-erection in London in 1821. The ministry desired that the body of Queen Caroline should be conveyed out of the country to Germany, for interment, without the populace having the opportunity of making any demonstration. On the matter becoming known, a vast barricade was erected at the point where the Hampstead Road joins the New Road; and as nothing but the use of artillery could have forced the way, the officer in charge of the funeral cortege deemed it prudent to change his course, and pass through a more central part of the metropolis. During the revolutions of

1848, B. were successfully carried in Paris, Berlin, Vienna, and other places, by abandoning the attack in front, and breaking through the houses of contiguous streets, taking their defenders in the rear.

BA'RRIER ACT, the name commonly given to an act of the General Assembly of the Church of Scotland, 8th January 1697, intended as a barrier against innovations, and a hinderance to hasty legislation. It provides that no change can be made in the laws of the church without being submitted by that General Assembly which first approves it, to the consideration of all the presbyteries, and approved by a majority of them; after which it still remains to be considered by the next General Assembly, which then may or may not pass it into a law. The B. A. is regarded as of the greatest importance, both in the Established Church of Scotland, and in the Free Church. Analogous regulations have been adopted by other Presbyterian churches.

BA'RRIER REEF, an immense coral-reef extending along the north-east coast of Australia for nearly 1300 miles, at a distance from the shore of from 10 to upwards of 100 miles. The reef is, in general, precipitous, and in many places rises out of great depths, lines of 280 fathoms having failed to reach the bottom on the outer side. Formerly, ignorance of anything like its precise extent and character led to many shipwrecks; but within the last thirty years, it has been surveyed, and pretty accurately laid down on charts. In the course of its length there are several breaks or passages in it. In the voyage from Sydney to Torres Strait, the inner route is usually taken. It is narrow, and requires delicate steering; but it is safe, and not so much exposed as the outer route, which enters Torres Strait by Flinders Entrance.

BA'RRING OUT, a practice formerly very common in schools, but now almost, if not altogether, abandoned. It consisted in the scholars taking possession of the school, and fastening the doors against the master, at whose helplessness they scoffed from the windows. The usual time for B. O. was immediately prior to the periodical vacation. It seems to have been an understood rule in B. O., that if the scholars could sustain a siege against the master for three days, they were entitled to dictate terms to him regarding the number of holidays, hours of recreation, &c., for the ensuing year. If, on the other hand, the master succeeded in forcing an entry before the expiry of that period, the insurgents were entirely at his mercy. The masters, in most cases, appear to have acquiesced good-humouredly in the custom; but some chafed at it, and exerted their strength and their ingenuity to storm or surprise the garrison. Addison is said to have been the chief actor in a B. O. of the master of Lichfield. One remarkable and fatal case of B. O. occurred at the High School, Edinburgh, in September 1595. The scholars had to complain of an abridgment of their usual holidays by the town-council, who, on being remonstrated with, refused, even though the claim was supported by the master, to grant more than three of the eight days which the boys demanded as their privilege. They, accordingly, took advantage of the master's temporary absence to lay in a store of provisions, and having done so, they barricaded the doors. The magistrates, the patrons of the school, in vain sought admission, the boys saying they would treat with their master only; and after a day and night had passed, it was resolved to force an entrance. The result was, that one of them, Bailie Macmoran, was shot dead on the spot by a scholar named Sinclair. The scholars of Witton School, Cheshire, were directed by the statutes drawn up by the founder, Sir John Deane, to observe the practice: 'To the end that the schollars have not any evil opinion of the schoolmaster, nor the schoolmaster should not mistake the schollars for requiring of customs and orders, I will that upon Thursdays and Saturdays in the afternoons, and upon holydays, they refresh themselves—and a week before Christmas and Easter, *according to the old custom, they bar and keep forth the schoolmaster, in such sort as other schollars do in great schools.*' This school was founded in 1558. See Brand's *Popular Antiquities*, Chambers's *Domestic Annals*, and Carlisle's *Endowed Grammar Schools*.

BARRINGTONIA'CEÆ, a natural order of exogenous trees and shrubs, natives of tropical countries, and generally very beautiful both in foliage and flowers. Few plants, indeed, exceed some of them in beauty. The stamens are very numerous, and form a very conspicuous part of the flower. The fruit is fleshy, with bony seeds lodged in pulp. That of some species is eaten, as *Careya arborea*, an Indian tree, the stringy bark of which is used in the countries along the foot of the Himalayas as a slow match for matchlock guns. Humboldt and Bonpland mention that children become quite yellow after eating the fruit of an American species, *Gustavia speciosa*, of which, however, they are very fond; but that this colour disappears in a day or two. The MOORELLA (*Barringtonia speciosa*) is described by Sir J. E. Tennent as a tree which much attracts the attention of travellers in Ceylon. It has dark, glossy leaves, and delicate crimson-tipped white flowers. 'The stamens, of which there are nearly 100 to each flower, when they fall to the ground, might almost be mistaken for painters' brushes.' Some botanists include the order in *Myrtaceæ* (q. v.).

BA'RRISTER, REVISING. See REVISING BARRISTER.

BA'RRISTERS, or **BA'RRASTERS,** as sometimes spelt in old books. This is the distinctive name by which the advocates or pleaders at the English and Irish bars are known; and thus its derivation is perhaps sufficiently accounted for. They are admitted to their office under the rules and regulations of the INNS OF COURT (q. v.), and they are entitled to exclusive audience in all the superior courts of law and equity, and generally in all courts civil and criminal, presided over by a superior judge. In certain of the inferior tribunals, attorneys are allowed to practise without the assistance of counsel; but the disposition of the judges of these inferior courts is to encourage the presence of the regular bar, and to give them exclusive audience. In Scotland, the same body are styled ADVOCATES (q. v.), and they have the same exclusive privileges that B. enjoy in England and Ireland. These Scotch advocates, however, are members of the Faculty of Advocates, or Scotch Bar, properly so called, and are not to be confounded with the advocates who practise under that name in the town and county of Aberdeen, and who, as explained in a former article, are simply country attorneys. See ATTORNEYS AND SOLICITORS.

Barristers were first styled *Apprentices*, who answered to the bachelors of the universities, the state and degree of a serjeant did to that of doctor. These apprentices or barristers have been first appointed by an ordinance of Edward I. in parliament, in the twentieth year of his reign (Stephen's *Commentaries*, vol. i. p. 72, and authorities there referred to). Of barristers there are various ranks and degrees, each other they take precedence as to general name, 'counsel,'

court, common to them all. But they may be divided into three leading bodies. 1*st*, Barristers simply, or utter barristers, who occupy the position of junior counsel, wearing a plain stuff-gown and a short wig; 2*d*, *Serjants-at-law*, a legal order of very ancient state and degree, and who are distinguished by the *coif* and other peculiarities (see SERJEANTS-AT-LAW); and 3*d*, *Queen's Counsel*, or Her Majesty's Counsel learned in the law, as they are more formally called, and who may be selected either from the outer or junior bar, or from the serjeants. They may be described as the ordinary leaders of the bar, and are distinguished by a silk gown, and on state-occasions, and always in the House of Lords, they wear a full-bottomed wig. For further details, see QUEEN'S COUNSEL. Besides these three orders or gradations of rank at the English bar, the crown sometimes grants letters-patent of precedence to such barristers as Her Majesty may think proper to honour with that mark of distinction, whereby they are entitled to such rank and pre-audience as are assigned to them by their respective patents. See PRECEDENCE, PATENT OF.

Thus constituted, the English bar perform their functions, enjoying many professional privileges and immunities, and a high social position. As we have before stated, they have exclusive audience in all the superior courts, where upon terms and conditions, and according to an etiquette, which are all well understood by attorneys and solicitors, they confine upon themselves the protection and defence of any suitor, whether plaintiff or defendant. With the *brief* (q. v.), or other instructions, by means of which their professional services are retained, B. receive a fee, or such fee is endorsed on the brief or instructions, and afterwards paid. Such, generally, is the existing practice at the English bar, differing in this respect from the practice of the bar in Scotland and, we believe, to a great extent in Ireland also where *pre-payment* of the fee is the rigid etiquette. The amount of this fee in England depends, of course, on the nature of the business to be done, the time to be occupied, and the labour to be bestowed; and it is usually, especially in the case of leading counsel, a liberal sum. The barrister's fee, however, is not a matter of express contract or stipulation, recoverable at law like an attorney's bill of costs, but is regarded as a mere honorary reward - *quiddam honorarium*, as it is called in law-books. There is, therefore, no means of enforcing its payment, and indeed, in this respect, the barrister has nothing to rely upon but the honour and good faith of those who employ him. Where, however, it can be proved that the client or party gave money to the solicitor or attorney, with which to fee the counsel, the latter may maintain an action against the former for the amount.

In order to encourage due freedom of speech in the lawful defence of their clients, and, at the same time, to give a check to unseemly licentiousness, it has been held that a counsel is not answerable for any matter by him spoken, relative to the cause in hand, and suggested in his client's instructions, although it should reflect upon the reputation of another, and even prove absolutely groundless;* but if he mentions an untruth of his own invention, or even upon instructions, if it be impertinent to the cause in hand, he is then liable to an action from the party injured; and counsel guilty of deceit or collusion are punishable by the statute *Westm.* I. (3 Edw. I., c. 28) with imprisonment for a year and a day, and perpetual silence in the courts—a punishment which may be inflicted for gross misdemeanours in practice, although the course usually resorted to is for the Benchers of the Inn of Court, to which the person so offending belongs, to *disbar* him. See Stephen's *Commentary*, and Ker's *Blackstone*, and see BENCHERS and DISBAR.

But besides advocacy and forensic disputation, B. in England have other business to which they have extended their practice, to the great advantage of the public. This additional practice consists in advising on the law by their opinion on a case stated, by means of which harassing and fruitless litigation is often prevented (see OPINION OF COUNSEL); in drawing or preparing the pleadings or statement of facts on which an action or suit is founded (see PLEADING); and in preparing the drafts or scrolls of legal instruments, indentures, deeds, contracts, or other conveyances. See CONVEYANCING and CONVEYANCER. As a correlative privilege of the position in which they stand in respect of their fees, barristers are not personally liable for the injurious consequences of any erroneous advice they may give; and they claim absolute control over the conduct of all litigation in which they may be engaged, even to withdrawing it from court altogether, and referring it to arbitration; and until lately, it was the opinion of the profession that counsel might at any time, during the progress of a cause, compromise the matter in dispute; but the exercise of such discretion was successfully opposed in a recent case, and it may now be doubted whether B. have any *ex officio* privilege beyond the guidance and conduct of actual litigation in court.

It is from the body of B. that all the judges in England, superior and inferior, are appointed; but B. are also usually chosen for the office of police magistrate. The only exception to the exclusive appointment of B. to judicial offices, is the case of the Court of Quarter Sessions—a court of anomalous constitution and jurisdiction, but which works well in practice, and has many claims to consideration. See QUARTER SESSIONS.

The bar in Ireland stands on the same footing, and has the same ranks and degrees, and is subject very much to the same rules and regulations, as the English bar; and in that country, barrister also is the name by which the profession of an advocate is distinguished. In Scotland, the same office is simply called by its own name of *Advocate*. See ADVOCATES, FACULTY OF.

At the bar of the House of Lords, and before parliament generally, before the privy council, and also, it is believed, in all trials for high treason, whether in England, Ireland, or Scotland, the three bars rank on a footing of equality, taking precedence according to the date of their call and admission to their own respective bars, with the exception of those who are Queen's counsel, who recently have also been introduced into Scotland, and now are next in precedence to the Lord Advocate (see ADVOCATE, LORD), the *Solicitor General of Scotland* (q. v.), and the *Dean of Faculty* (q. v.). It was at one time disputed between the Lord Advocate of Scotland and the Attorney-General of England, which of them should lead the other at the bar of the House of Lords; and a case occurred in 1834 in the House of Lords, before Lord Chancellor Brougham, in which very high pretensions were urged on behalf of both functionaries. These were the present Lord Chancellor Campbell as attorney-general, and the late Lord Jeffrey as lord advocate, who contended that as he was not only the first law-officer of the crown in Scotland, but also a high political officer, he was entitled to lead the former. But the House decided that the attorney-general of England has precedency over the Lord Advocate of

* But the publication of the counsel's statement by a *third party* may expose such third party to an action.

Scotland, in all matters in which they may appear as counsel at their lordships' bar; and it is presumed that the same rule would be followed before parliament generally, the privy-council, and in all trials for high treason, whether in England, Ireland, or Scotland. The relative rank of the *Irish* law-officers has not been determined.

It only remains to be added, that as the three bars are on a footing of equality in the House of Lords, and the other imperial and supreme tribunals above mentioned, the English bar have no exclusive audience in these, even in English cases; but all causes whatever there, whether English, Irish, Scotch, or colonial, may be equally and indiscriminately taken and advocated by English, Irish, or Scotch counsel.

BA'RROS, JOÃO DE, the most distinguished of Portuguese historians, was born of an ancient and noble family at Viseu in 1496; became a page to King Emmanuel, and afterwards companion to the Crown Prince. He pursued his classical and other studies with great diligence, and wrote a historical romance in his 24th year, which attracted much admiration by the peculiar beauty of its style. Hereupon the king assigned him the task of writing the history of the Portuguese in India, which he undertook, but of which only the first three decades proceeded from his pen, under the title of *Asia Portugueza* (Lisb. 1552—1563); the continuation extending to twelve decades, was the work of Diego de Couto. (A new edition of the whole appeared at Lisbon, in 8 vols., in 1778—1788.) B. was for some time governor of the Portuguese settlements in Guinea, and afterwards treasurer and general agent for the Indies. In 1539, the king bestowed on him the province of Maranhao in Brazil, that he might found a colony there; but he was obliged to renounce the enterprise after much loss. He died at his estate of Alitem on the 20th of October 1570.

BARRO'SA, a village of Spain 16 miles south-south-east of Cadiz, celebrated in history as the place where General Graham (afterwards Lord Lynedoch), in March 1811, with a handful of English troops, succeeded in gaining over the French, after his Spanish allies had retreated, one of the most glorious victories of the Peninsular campaign. More than 2000 French were killed and wounded (some authorities give nearly 3000 killed alone), 300 prisoners taken, 6 pieces of cannon, and an eagle—the first captured in the war.

BARROT, CAMILLE HYACINTHE ODILLON, a French jurist and statesman, son of a member of the Convention, and afterwards of the Council of Five Hundred, was born at Villefort, Lozère, 19th July 1791. In 1814, he became an advocate in the Court of Cassation, Paris, and soon acquired a high reputation as an eloquent pleader. Entering the Chamber of Deputies young, he in time came to be regarded as one of the most influential leaders of the liberal opposition. At the Revolution of 1830, he was one of the three commissioners appointed by the provisional government to accompany Charles X. from Rambouillet to Cherbourg, on his embarkation for England. Under the new government, he was appointed prefect of the department of the Seine; and in Lafayette's ministry, a member of the Council of State. In a few months, however, he resigned his office of prefect, and declined the post of ambassador at Constantinople, offered him by Louis Philippe. After Casimir Périer became minister, he lost also his place in the Council of State. He now began his opposition career in the Chamber of Deputies against the reactionary policy of the government, and became the rallying-point for all who desired the carrying out of the principles of the July revolution. He essentially contributed to the removal of the Doctrinaires (q. v.) from office, in February 1836, and energetically opposed the ministry of Molé, even supporting the Doctrinaires in accomplishing its overthrow, in January 1839. The same year he visited England and Scotland. When, in March 1840, Thiers was placed at the head of the government, B. for the first time declared himself in favour of the ministerial policy on the oriental question. On the return of Guizot to office in October following, his opposition to the government was renewed. Taking a conspicuous part in the Reform movement of 1847, he attended several of the provincial reform banquets, which led to the revolution of 1848. On the outbreak of the struggle of 23d February, when Louis Philippe called upon Thiers to form a new ministry, B. was appointed president. His advice to the king to withdraw his troops proved fatal to the throne of July. In the last sitting of the Chamber of Deputies, B. supported the claim of the Count de Paris to the throne, and the regency of the Duchess of Orleans. Under the presidency of Louis Napoleon he was for some time a minister, and conducted the government with success till 1851, when he retired from active political life. Since then, almost his only public appearance has been at the conferences in favour of Poland, held at Paris in 1864. In his retirement, he has, however, written a pamphlet, *De la Centralisation et de ses Effets* (1861), and several other papers on political subjects.

BA'RROW, a distinctive term applied to two prominent localities of the Arctic Ocean in honour of the secretary to the Admiralty of the same name, the prime mover in the more recent era of northern discovery.—1. *Point B.*, in lat. 71° 23′ N., and long. 156° 31′ W., generally received as the most northerly spot on the American mainland; see, however, BELLOT STRAIT, and MURCHISON PROMONTORY. From this circumstance it has also been called *Cape North*—a designation inconveniently ambiguous, as tending to confound this headland at once with Cape North in Asia, and with North Cape in Europe.—2. *Barrow Strait*, the earliest of Parry's discoveries, leading to the west out of Lancaster Sound, which Parry's immediate predecessor, Captain, afterwards Sir John Ross, had pronounced to be landlocked in that direction. Besides its main course, B. Strait throws off *Prince Regent's Inlet* to the south, and *Wellington Channel* to the north. The passage averages about 40 miles in breadth, extending pretty nearly along the parallel of 74° N., from 84° to 90° W.

The interval between these two localities, thus spanning 66° of long. or at least 2000 miles, only one navigator has ever traversed—the indefatigable M'Clure, carrying his good ship, the *Investigator*, round Point B., and leaving her behind him only when almost in sight of B. Strait.

BA'RROW, a river in the south-east of Ireland. Of the Irish rivers, it is in importance next to the Shannon. It rises in the north of Queen's County, on the north-east slope of the Slieve Bloom ridge of mountains. It flows first east past Portarlington to the border of Kildare County, and then south between Queen's, Kilkenny, and Waterford counties on the west, and Kildare, Carlow, and Wexford counties on the east, passing the towns of Athy, Carlow, and New Ross. It has a course of 100 miles through a carboniferous, granitic, and silurian basin. Two miles above New Ross it receives the Nore (q. v.), and eight miles east of Waterford, it is joined by the Suir (q. v.). These three rivers (called the Three Sisters, from their rising in the same mountain-ridge, and joining near

sea, after flowing through different counties) n, near the sea, the large and secure estuary of arford harbour, 9 miles long. The B. is navig- for ships of 300 tons to New Ross, 25 miles up, for barges to Athy, 65 miles up, whence the nd Canal communicates with Dublin. The B., w Portarlington, falls 227 feet.

RROW, Isaac, an eminent English mathe- ician and divine, was born in 1630. He received early education at the Charter-house, where he distinguished chiefly by his negligence and nacity. At Felstead school, in Essex, to which rent next, he greatly improved; and in 1643, he entered at Peter-house, Cambridge, under his le Isaac Barrow, then a fellow of that college, finally bishop of St Asaph. On the ejection of uncle in 1645, he removed to Trinity College, he became B.A. in 1648, fellow in 1649, and in 1652. Finding that to be a good theologian must know chronology, that chronology implies nomy, and astronomy mathematics, he applied self to the latter science with distinguished ess. To the classics he had already devoted h study, and on the vacancy of the Greek chair, as recommended for the office; but a suspicion Arminianism interfered with his success. After disappointment, he went abroad (1655), and elled during four years through France and y, to Smyrna and Constantinople, back to ice, and home through Germany and Holland. the voyage from Leghorn to Smyrna, his determined personal courage seems to have been instrumental in scaring away an Algerine pirate, after a k exchange of shots. Soon after his return he orders, and in the following year was appointed ssor of Greek. The neglect with which he treated after the Restoration is celebrated in couplet addressed to the king:

> Te magis optavit rediturum, Carole, nemo,
> Et nemo sensit te rediisse minus.

662, he was appointed to the Greekam professorship of geometry, which, on his being appointed to Lucasian professorship in 1663, he thought it his to resign. The latter also he resigned in 1669, favour of his pupil Isaac Newton. On quitting professorship, he obtained from his uncle a small ng in Wales, and from Dr Seth Ward, bishop alisbury, a prebend in that cathedral. He devoted the revenues of both to charitable purposes, resigned them in 1672, on being appointed by king Master of Trinity College. To him, while his office, is due the foundation of that valuable y, which is one of the chief ornaments of the ersity. In 1675, he was nominated vice-chancellor of the university; and in 1677, he died at the y age of 47, having achieved, by his numerous works, and the force of his noble personal acter, a reputation which time has left unimpaired. Of his original mathematical works, the cipal are his *Lectiones Geometricæ* and *Lectiones ticæ*, of which it has been said that they are nne of curious interesting propositions, to which try is always applied with particular elegance.' s theologian, his fame rests chiefly on his ions, which are very remarkable as specimens lear, exhaustive, and vigorous discussion. His ons, it may be added, were generally of excessive length. One, on charity, lasted three hours and lf; and at Westminster Abbey, he once detained audience so long that they got the organ to 'till they had blowed him down.' B.'s English ks, consisting of sermons, expositions, &c., have been edited by Dr Tillotson, Dean of Canterbury, prefaced with a life by Mr Hill. His works, besides those already mentioned, are very numerous, and include *Euclidis Elementa*, *Euclidis Data*, *Mathematicæ Lectiones*, *Opuscula*, containing Latin sermons, poems, speeches, &c. *Lectiones Mathematicæ* and *L. Geometricæ* have been translated by Kirby and Stone. *Euclidis Elementa* has also been translated.

BARROW, Sir John, Baronet, an English traveller, was born on the 19th June 1764, at Dragleybeck, in Lancashire; was early instructed in mathematics; and after having published a small volume on land-surveying, filled a situation in a Liverpool iron-foundry, visited Greenland with a whaler, and after his return taught mathematics in an academy at Greenwich. He received an appointment as private secretary and keeper of accounts to Lord Macartney, who went as ambassador to China. He availed himself of his residence in China to learn the Chinese language, and to collect valuable materials for the account of China, which he afterwards gave to the world, partly in articles in the *Quarterly Review*, and partly in his *Travels in China* (Lond. 1804). When Lord Macartney afterwards became governor of Cape Colony, B. availed himself of his residence in South Africa to make extensive excursions in the interior of the country, which he described in his still valuable *Travels in the Interior of Southern Africa* (2 vols., Lond. 1801—1803). Having returned to London, in the year 1804, he was appointed by Lord Melville secretary to the Admiralty, which situation he continued to hold till 1845, except for a short time in 1806. Besides the works above mentioned, B. published *A Voyage to Cochin-China in the Years* 1792 *and* 1793 (Lond. 1806), *The Life of Macartney* (2 vols., Lond. 1807), *A Chronological History of Voyages into the Arctic Regions* (Lond. 1818); also a series of Lives of English Naval Worthies. Under Peel's ministry in 1835, he was raised to the baronetcy. In the year 1845 he retired from public service, but afterwards published *An Autobiographical Memoir* (Lond. 1847), and *Sketches of the Royal Society*, and died at London, 23d November 1848. He rendered many services to geographical science by suggesting and promoting Arctic expeditions; with him also originated the idea of the Geographical Society, founded in 1830, of which he was vice-president till his death.

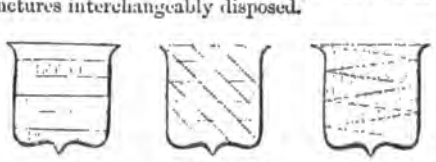
BARROW-ON-SOAR, a village in the north of Leicestershire, 10 miles north of Leicester. It is noted for its lime or terras, which makes good cement under water. It has manufactures of lace and stockings. It has free schools and several charities; and is the seat of the Poor-Law Union of the district, with a workhouse capable of accommodating 500 persons.

BARROWS, artificial mounds of earth generally believed to have been erected for sepulchral or monumental purposes. They are very numerous in Great Britain, and many of them are supposed to belong to a period long prior to the Roman invasion. The counties of Wilts and Dorset are especially rich in these remains, and the B. of the former have been thoroughly explored, described, and classified by Sir R. C. Hoare in his *Ancient Wiltshire* (2 vols. fol. 1810—1821). In the sepulchral B., the human remains are buried either in a rude stone 'cist' or chest, in which the body was doubled up, or are laid at full length in the earth, accompanied by arms and other utensils. Where the body was burned, the remains were laid on the floor of the barrow, in a cist excavated on the spot, or at a later epoch, in a clay urn. Sir R. Hoare considers the Wiltshire B. as indicating three stages in the progress of society. The first class contains spear and arrow heads of flint and bone; the second,

of brass; and the third contains arms and instruments made of iron. One of the largest barrows in Europe is Silbury Hill, near Marlborough, in Wiltshire, which covers 5 acres, 34 perches of land, and has a slope of 316 feet, with a perpendicular height of 170. According to Sir R. Hoare, barrow-burial was practised down to the 8th c., from a period of unknown antiquity. The practice of erecting sepulchral mounds prevailed among all the principal nations of antiquity both in Europe and Asia, and they are found in great numbers in Central America. Many barrows are only partly artificial; natural mounds having been shaped by human hands into the form, round or oblong, which it was wished they should take.

BA'RRY, a small island, of about a mile long, in the Bristol Channel, off the south coast of Glamorganshire, 10 miles south-west of Cardiff. It has the ruins of an ancient castle and of two chapels. On Nell's Point, in the south part of the island, is a fine well, to which great numbers of women resort on Holy Thursday, and having washed their eyes in the spring, each drops a pin into it.

BA'RRY (in Heraldry), the term applied to a shield which is divided transversely into four, six, or more equal parts, and consisting of two or more tinctures interchangeably disposed.



Barry. Barry-bendy. Barry-pily.

Barry-bendy is where the shield is divided into four, six, or more equal parts, by diagonal lines, the tincture of which it consists being varied interchangeably.

Barry-pily is where the shield is divided by diagonal lines, the colours being interchanged as in the example.

BA'RRY, Comtesse du. See Vaubernier.

BA'RRY CO'RNWALL. See Procter, Bryan Walter.

BA'RRY, Sir Charles, R.A., architect of the two Houses of Parliament, son of Walter Barry, Esq., Westminster, was born there in May 1795. Educated at private schools in Leicestershire and Bedfordshire, he was indentured to Messrs Middleton and Bailey, architects, Lambeth. In 1817, at the age of 22, he went to Italy. A wealthy countryman of his own, attracted by the beauty of his drawings, took him with him to Egypt, as his companion, defraying his expenses. He also visited Greece and Rome. On his return to England after an absence of three and a half years, he became the successful competitor for the design of a church at Brighton. He was also the architect of the Manchester Athenæum, a building in the Grecian style; and of the Grammar School of King Edward VI. at Birmingham; the latter esteemed the most beautiful of his works. In London, he designed the Traveller's Club, and the Reform Club, both in Pall Mall, and the College of Surgeons, Lincoln's Inn Fields. After the burning of the old Houses of Parliament in 1834, on a public competition, B.'s design for the new building was adjudged the best. The work was commenced in 1840; and on 34 February 1852, Her Majesty opened the Victoria Tower and Royal Gallery in state, and on the occasion knighted the architect. Chosen a Royal Academician in 1842, Sir Charles was also a Fellow of the Royal Society, of the Society of Arts, and of the Institute of British Architects. He died May 12, 1860.

BA'RRY, James, a historical painter, born at Cork, October 11, 1741; and distinguished more by the force of his conception than the excellence of his manipulation, or the beauty of his colour. Dr Johnson's criticism on his works was: 'Whatever the hand may have done, the mind has done its part. There is a grasp of mind there which you will find nowhere else.' The *chef-d'œuvre* of B. is the *Victors at Olympia*—a work, the sight of which, Canova said, was of itself sufficient to repay a journey to England. B. was a protégé of Edmund Burke. He was of irritable temper, which led him into many quarrels; and the result of one with the Royal Academy was his expulsion from the academy. He died on the 22d of February 1806, in poor circumstances, while some friends were engaged in raising subscriptions to purchase him an annuity.

BA'RRY, Martin, a physiologist of eminence, was born at Fratton, Hampshire, in 1802. He studied at the medical schools of London, and also at the university of Edinburgh, where he took his degree of M.D. in 1833. He wrote much on physiological subjects, and especially on animal development and embryology, for discoveries in which he is best known. Until the publication of his papers in the 'Philosophical Transactions' of the Royal Society of London in 1840–1843, it was not known that spermatozoa actually penetrate *within* the ovum; and physiologists are also indebted to him for the knowledge of the segmentation of the yelk in mammals. In his private capacity, B. was amiable and greatly benevolent. His means being ample, he gave his professional services largely to the poor; and he acted as house-surgeon to the Edinburgh Royal Maternity Hospital. He died at Beccles, in Suffolk, in April 1855.

BARSCH, or BARS, a fortified town of Hungary, capital of the county of the same name. It is situated on the Gran, which divides it into Old and New B. It is a mart of some importance for grain and fruit. Pop. of county, 137,191.

BAR-SUR-AUBE, a town of France, in the department of Aube, situated on the right bank of the river of that name. It is an ill-built ancient town; numerous old coins and urns attesting that the Romans must have had a station here. It was destroyed by the Huns in the 5th c., but rebuilt again soon after, when it became a place of commercial importance. A chapel built on the bridge which here crosses the Aube, now marks the spot from which the Bastard of Bourbon was hurled into the river by command of Charles VII. in 1440. It is also noteworthy as the place where the council of the allied sovereigns, which decided the plan of the campaign ending in the first fall of the Empire, was held in February 23, 1814; and where, two days after, the French were defeated by the allies, under the chief command of Schwartzenberg. B. has a population of 4336; a good trade in wine, wood, hemp, corn, and wool. Its principal industrial products are calicoes, table-covers, brandy, paper, vinegar, and nails.

BAR-SUR-SEINE, an ancient town of France, in the department of Aube, pleasantly situated on the left bank of the Seine. It has a trade in grain, brandy, wool, and wine. Pop. 2443. It is celebrated as the place where the allies, under the Prince of Würtemberg, defeated the French under Macdonald, in March 1814.

BARTA'N, a town of Anatolia, situated near the mouth of the Chati-su (ancient *Parthenius*) on the Black Sea. Pop. 10,000, who carry on a brisk trade with Constantinople.

BARTAS, Guillaume de Salluste, a soldier, diplomatist, and man of letters, was born at Montfort, in Armagnac, about the year 1544. His reputation was great during his lifetime, alike in 'the court, the camp, the grove.' His chief poem is *The Divine Weeks and Works*, which gives an account of the creation, and the history of the Jews as far as the book of Chronicles, and is said to have had a considerable influence on Milton's *Paradise Lost*. Thirty editions of the work passed through the press in six years. Dryden, when a boy, thought his verse incomparably superior to Spenser's; an opinion, however, which he lived to be ashamed of having ever entertained. B.'s name is now quite forgotten, or remembered only in connection with bad taste. It is not to be denied, however, that his fancy, though generally grotesque and lawless, occasionally strikes out most picturesque imagery and epithets. His use of compound words first led to their introduction into England, through his translator Sylvester (q.v.), and to the consequent enrichment of our poetry. He died of wounds received at the battle of Ivry, 1590.

BARTER, in commerce and political economy, a term used to express the exchange of one commodity for another, as contrasted with the sale of commodities for money. It is usual to suppose that in the history of any community B. preceded the other methods of commerce, as people would find the convenience of exchanging one article for another before they were acquainted with money or credit. In point of fact, ships visiting savage countries are generally to some extent freighted with weapons, tools, or ornaments, to be used in B., if it be desirable to carry on a trade with the inhabitants. Under old artificial systems of political economy, there was much useless discussion about the question, whether a B.-trade or a money-payment trade was more advantageous to the community at large, and which of them should be encouraged while the other is depressed. On the one side, it was maintained that nothing but an export sale for cash was really profitable; on the other, that it was more advantageous to get goods in return, because thus there was a double transaction and double profit. See Balance of Trade. But the simple doctrine of the present day, that whatever the merchant finds most profitable to himself will also be most profitable to the community, saves the necessity of making these distinctions, and of acting upon them by interference with commerce. B. is, in reality, one of the commonest forms of trade, taken at large in the present day. The exporter sends goods to his agent, who, without probably ever touching hard cash in the course of the transaction, lays in a cargo of import goods with the value, and these are literally brought home in exchange for those sent out.

In Law, Barter, or Exchange, as it is now more generally called in law-books, is a contract for transferring property, the consideration being some other commodity; or it may be described as a contract for the exchange of two subjects or commodities. It thus differs from *sale*, which is a contract for the transference of property in consideration of a price in *money*. See Exchange; Sale.

BARTFA, or BARTFELD, a small but very old free town of North Hungary, in the province of Saros, on the Tepla, 155 miles north-east of Pesth. Its position on the borders of Galicia has frequently made it a place of refuge for Poles and Russians. Its hot baths are much frequented, and a trade in wine, brandy, linen, and earthenware is carried on. Pop. 5303.

BARTH, Heinrich, Ph.D., D.C.L., an enterprising modern African traveller, born at Hamburg, 19th May 1821, received his education in his native town, and afterwards went to the university of Berlin. In his youth his favourite studies were the Roman and Greek classics and antiquities, along with the geographical sciences. Hence he imbibed a strong desire to explore the shores and countries of the Mediterranean. After visiting Italy and Sicily, he embarked, in 1845, at Marseille, and from Gibraltar passed over to Tangier in Africa. Proceeding along the Algerian coast he made excursions into the interior, to Tunis, Tripoli, and Bengazi. On his journey thence to Cairo, he was attacked by a band of Arab robbers, whom he bravely resisted, but was severely wounded, and lost all his effects and papers. He afterwards extended his researches into Egypt, Sinai, Palestine, Asia Minor, and Greece. These travels occupied him for nearly three years, and in 1849 he published, at Berlin, an account of a portion of them in a work entitled *Wanderungen durch die Küstenländer des Mittelmeers*. On the 8th December of that year he again sailed from Marseille, having been (along with Dr Overweg) appointed by the British government scientific companion to Mr James Richardson, then charged by the Foreign Office with a political and commercial mission to Central Africa. Starting from Tripoli on the 4th February 1850, Dr B. and his companion crossed the Great Desert amid much difficulty and danger. B. soon separated from his friends, and pursued his researches for the most part by himself. Both Mr Richardson and Dr Overweg succumbed to the climate, and thenceforward B. was quite alone. He did not, however, return disheartened, but continued his explorations, which, when he returned to Tripoli in September 1855, had extended over 24 degrees of latitude and 20 of longitude, from Tripoli in the north to Adamawa in the south, and from Bagirmi in the east to Timbuktu in the west, upwards of 12,000 miles. The result of his researches was given to the world in his *Travels and Discoveries in Central Africa*, 5 vols. (London, 1857–1858). Afterwards, he made several journeys in Greece, Turkey, Asia Minor, and other countries on the Mediterranean. Shortly after returning from one of these, he died at Dresden, Nov. 25, 1866. In 1858, appeared his *Reise von Tripolis durch die Wüste Hamâda, Kleinasien nach Skutari*; in 1862, his *Sammlung und Bearbeitung central-afrik. Vokabularien*.

BARTH, Jean, or BART, a French naval hero, the son of a fisherman, born in 1651 at Dunkirk, but, according to others, in the Netherlands. At an early age he entered the Dutch navy, but on the commencement of the war with Holland he passed over to the French service. As persons not of noble birth could not then obtain the rank of officer in the navy, he became captain of a privateer. In this capacity he displayed astonishing bravery, so that Louis XIV. despatched him on a special mission to the Mediterranean. His exploits at last induced the king to appoint him lieutenant of a man-of-war. In an action against a superior English force he was taken prisoner, and carried to Plymouth, from which he made his escape in an open fishing-boat to France, where the king now raised him to the rank of captain. In the year 1696, Louis XIV. received him with distinction at Versailles, but at the same time spoke continually of the mischance which had befallen him the year before. Stung by this, B. hastened to Dunkirk, and in spite of the blockade of the harbour by the English, undertook a cruise, in which he was remarkably successful. Louis XIV., in a personal audience in 1697, appointed him to the command of a squadron, upon which B. exclaimed: 'Sire, you have done well in this.' The courtiers laughed, as at a piece of gross rudeness; but the king took the answer in

good part, and B. very soon shewed how well he merited such an appointment. The peace of Ryswick terminated his active career. He died at Dunkirk in 1702. His rough frankness and coarse wit, in which he spared neither high nor low, made him popular, no less than his boldness and readiness for battle. When the Prince de Conti was nominated king of Poland, B. was required, by command of Louis XIV., to convey him to Elsinore, and the ship being attacked by the English on the voyage, was near being taken. After the action, the prince expressed to him his great delight that they had escaped from the enemy. 'We had no need,' was the reply, 'to be afraid of being made prisoners; I had despatched my son with a match to the powder-magazine, to blow up the ship on the first wink!'

BARTHÉLEMY, JEAN JACQUES, a historian and antiquary, born 20th January 1716, at Cassis, near Aubagne, in Provence. He was educated under the Jesuits for the church, but soon abandoned all thought of becoming a priest, and devoted himself to the study of the Greek, Hebrew, Syriac, Arabic, and Chaldee languages, though he retained the dress and title of an abbé. He first acquired distinction by the discovery of the Palmyran alphabet. In 1745, he was appointed assistant-superintendent of the Royal Cabinet of Medals, and in 1747 elected a member of the *Académie des Inscriptions et Belles-lettres*. To complete his studies, he visited Rome in 1754, in the suite of M. de Stainville, afterwards Duke of Choiseul, and then French ambassador, where he was courteously received by Pope Benedict XIV. After his return, he was again employed in the arrangement of the Royal Cabinet of Medals, which he augmented by a great number of costly specimens. The Duc de Choiseul, who became minister in 1758, placed him, by means of a pension and other favours, in a position to devote himself entirely to learned researches, which he quietly pursued till the revolution of 1789 deprived him of his offices. In September 1793, he was imprisoned on charge of being an aristocrat, but almost immediately released. Shortly after, he was offered the situation of national librarian then vacant, but his age and infirmities compelled him to decline accepting it. He died on the 30th April 1795.

His most celebrated and popular work is the *Voyage du jeune Anacharsis en Grèce dans le Milieu du quatrième Siècle avant l'ère Chrétienne*. Paris, 1788, 4 vols. (Travels of the Young Anacharsis in Greece about the Middle of the Fourth Century B. C.). The work (see ANACHARSIS) is a very pleasing and agreeable performance; exhibits an extensive knowledge of the ancient world, especially of Greece and its colonies; and abounds in observations which, if not profound, are at least judicious. Later and more severe criticism has, however, pointed out many deficiencies and anachronisms. It has been translated into almost every European language. Among B.'s other works may be mentioned a romance, entitled *Voyage en Polydore* (Paris, 1760); *Explication de la Musique de Palestrine* (Paris, 1760); *Réflexions sur l'Alphabet et la Langue de Palmyre* (Paris, 1754).

BARTHÉLEMY SAINT-HILAIRE, JULES, a learned Frenchman, member of the Institute, and formerly a representative of the people, was born at Paris on the 19th of August 1805. He first held a subordinate office under the minister of finance. During 1828–1830, he was one of the editors of the *Globe*, a Paris paper. After the July revolution, he took part with the society *Aidetoi et le Ciel t'aidera* (q. v.), revised several of its democratic manifestoes, established the *Bon Sens*, and continued to attack the government of Louis Philippe in the *Constitutionnel*, the *Courrier-Français*, and the *National*. In 1833, he desisted from political strife, and betook himself to more quiet studies. In 1834, he was named *Repétiteur* for the French Literature Class in the *Ecole Polytechnique;* and in 1838, professor of Greek and Latin philosophy in the *Collège de France*. The revolution of February, however, brought him once more into the political arena. He was appointed secretary to the Provisional Government, but refused his support to the government of Cavaignac, and even appeared as his accuser, though he failed to establish his charges against the suppressor of the June insurrection. B. was at first in favour of Louis Napoleon, but the *coup d'état* on the 2d of December, and the overthrow of the constitution, compelled him to become an oppositionist. He then retired for a time from public life, and resigned his chair; but in 1862 he was reappointed, and, at the general election of 1869, was returned to the Corps Législatif as deputy for the first circumscription of Seine-et-Oise.

His principal writings are his translations of Aristotle's works—*Politique d'Aristote* (Paris, 1837); *De la Logique d'Aristote* (1838); *La Logique d'Aristote*, translated into French for the first time (1839—1844, 4 vols.); *Psychologie d'Aristote, Traité de l'âme* (1846); *De l'Ecole d'Alexandrie* (1845); *Rapport sur la Comparaison de la Philosophie Morale et Politique de Platon et d'Aristote, avec les Doctrines des plus grands Philosophes Modernes* (1854); *Des Vêdas* (1854); *Du Bouddhisme* (1855). An enlarged edition of this last work, containing an account of Buddhism as practised in Ceylon at the present day, was published in 1860.

BARTHEZ, PAUL JOSEPH, one of the most learned physicians of France, son of a distinguished engineer, born in Montpellier, 11th December 1734. After serving as an army-physician, he founded at Montpellier a medical school, which rose to a high European reputation. His *Nouveaux Eléments de la Science de l'Homme* (Montpell. 1778; 2d ed., 2 vols., Par. 1806), in which he set forth a system founded on dynamical principles, was translated into most of the languages of Europe. He became, in 1785, titular chancellor of the university of Montpellier; and consultations with him on serious cases were sought from all parts of the civilised world. The revolution deprived him of the greater part of his property and his places, and compelled him to leave Paris; but Napoleon recalled him, and heaped honours and dignities upon him in his old age. He died in great suffering, after an operation for stone in the bladder, on 15th October 1806. Of his numerous writings, the following deserve special mention: *Nouvelle Mécanique des Mouvements de l'Homme et des Animaux* (Carcassonne, 1798; *Traitement des Maladies Goutteuses* (2 vols., Par. 1802; new ed., 1819; and *Consultation de Médecine* (2 vols., Par. 1810).—See Lordat, *Exposition de la Doctrine Médicale de Barthez, et Mémoires sur la Vie de ce Médecin* (Par. 1818).

BARTHOLIN, the name of a Danish family distinguished for learning and authorship, and the members of which have filled many important offices, especially in the university of Copenhagen. KASPAR B., born 12th February 1585, at Malmö, where his father was a minister, studied theology and philosophy at Rostock and Wittenberg, and afterwards studied medicine. In the year 1610, he was made doctor of medicine at Basle. He practised for some time in Wittenberg, and in 1613 accepted an invitation to be professor of the Greek language and of medicine at Copenhagen, where, in 1624, he became professor of theology. He died at Sora in 1629. His *Institutiones Anatomicæ* (Wittenb., 1611, and often reprinted), which were translated into the

German, French, English, and Oriental languages, served in the 17th c., in many universities, as a text-book for prelections. Of his sons, who are all known in the learned world, the following especially deserve to be mentioned: the orientalist, JACOB B., born 1623, died at Heidelberg, 1653, known as the editor of the cabalistic works, *Bohir* and *Mojan Hachochma*; and THOMAS B., equally celebrated as a philologist, naturalist, and physician, who was born 20th October 1616. He became, in 1647, professor of mathematics, and in 1648 professor of anatomy, at Copenhagen; demitted these offices in 1661, and thereafter lived in retirement upon his estate of Hagestad. In 1670, the king appointed him his physician in ordinary, which situation he filled till his death, 4th November 1680. He enlarged the new edition of his father's Anatomy (Leyd., 1641; often reprinted) with a mass of new observations. Besides many other valuable anatomical and medical works, his works on biblical and other antiquities, and on natural philosophy, are particularly worthy of notice. He was one of the most learned and studious of physicians, and warmly defended Harvey's doctrine of the circulation of the blood. His son, KASPAR B., born 1654, died 1704, was likewise an accomplished anatomist; and another son, THOMAS B., born 1659, died 1690, is the author of a standard work on northern antiquities—the *Antiquitatum Danicorum Libri Tres* (Copenh., 1689); also of *De Causis Contemptæ a Danis adhuc gentilibus Mortis*.

BARTHOLOMEW, St, one of the twelve apostles, supposed to be the same person as Nathaniel. He was a native of Galilee, but nothing authentic is known regarding his life and labours. According to the traditionary record of Eusebius, he carried Christianity into India; Chrysostom speaks of him as a missionary in Armenia and Asia Minor, while a still later legend declares that he was crucified at Albania Pyla, the modern Derbend, a town on the Caspian Sea. The relics of St B. 'appeared' at Rome in 983 A.D., and are preserved there in the church bearing his name. The Roman and Anglo-catholic Churches hold a festival in his memory on the 24th August; the Greek Church, on the 11th June. The primitive church possessed an apocryphal Gospel under his name, but it is now lost.

BARTHOLOMEW, St, a Caribbean island, ceded, in 1784, by France to Sweden, whose sole transatlantic colony it is. It lies about 30 miles to the west of St Kitts, the lat. and long. of its east point being respectively 17° 53′ N., and 62° 52′ W. With an area of only 35 square miles, St B. contains about 10,000 inhabitants. The soil is fertile, though, as is generally the case in the group, fresh water is scarce. Like most of its neighbours, St B. is difficult of access, its only harbour being on its west side, near the chief town Gustavia.

BARTHOLOMEW FAIR, formerly held at West Smithfield, London, but discontinued since 1855. The charter of this fair was granted by Henry I., in 1133, to a monk named Rayer or Rahere, who had been his jester, and had founded the church and priory of St Bartholomew, with an hospital attached. The fair was held annually at the festival of St Bartholomew (August 24, old style), and, like all ancient fairs, was originally connected with the church, under whose auspices Miracle-plays (q. v.), founded on the legends of saints, were represented, which gave place to Mysteries, and these again to Moralities; afterwards, profane stories were introduced—the origin of the modern English drama. After the opening of the fair, it was customary anciently for wrestlers to exercise their art. Wild rabbits were hunted for sport by the mob, and the scholars from the different London schools met at the priory for disputations on grammar and logic, and to wrangle together in verse. In the first centuries of its existence, B. F. was one of the great annual markets of the nation, and the chief cloth-fair of the kingdom. The clothiers of England and the drapers of London had their standings, during the fair, in the priory churchyard. A pedlar's court, or court of *Pie Poudre* (q. v.), was held within the priory gates, for debts and contracts, before a jury of traders formed on the spot, at which the prior, as lord of the fair, presided by his representative or steward. In 1445, four persons were appointed by the Court of Aldermen as keepers of the fair and of the court of *Pie Poudre*, the city being thus in that court represented as joint lord of the fair with the prior. As the fair prospered, its chief articles of traffic were, in the first instance, cloth stuffs, leather, pewter, and live cattle; while it was rendered attractive to the crowds that attended it by a variety of popular amusements. All manner of shows, exhibitions, theatrical booths, &c., thronged the fair; and tumblers, acrobats, stilt-walkers, mummers, mountebanks, and merry-andrews resorted to it in great numbers. On the suppression of the religious houses, the priory was disjoined from the hospital, and the latter, on 27th December 1546, was, by Henry VIII., transferred to the corporation of London, a new hospital being established on the site of the former. The priory was purchased for £1064, 11s. 3d. by Sir Richard Rich, Chancellor of the Court of Augmentations, afterwards Lord Chancellor under the title of Lord Rich, and became his town-house. Towards the close of the 16th c., streets of houses began to be built on the site of the Cloth Fair, a name which is still retained. In 1593, the keeping of the fair was, for the first time, suspended by the raging of the plague. The same thing happened in 1603, in 1625, in 1630, in 1665, and in 1666. At this fair, foreigners were at first licensed for three days, and the city freemen as long as they would, which was six or seven days. In 1661, after the Restoration, the fair lasted for fourteen days or more. In 1685, it was leased by the city to the sword-bearer. After this period, it began to decay as a place of trade. In 1691, the continuance of the fair was limited to three days, besides the proclamation-day. In 1701, it was represented as a nuisance. In 1750 it was again limited to three days. By the alteration of the calendar in 1752, the fair, in the following year, was, for the first time, proclaimed on 3d September. In 1798, the question of abolishing the fair was discussed by the corporation. It had long ceased to be a place of traffic, and was only considered as a haunt of amusement, riot, and dissipation. The fair had latterly been attended only by the keepers of a few gingerbread-stalls; and in 1839, measures were first seriously adopted for its suppression. In 1840, the exhibitions were removed to Islington. Wild-beast shows were allowed, but dwarfs and giants were excluded. In 1850, the last proclamation by the lord mayor took place, and in 1855 the once famous B. F. came to an end. An octavo volume, entitled *Memoirs of Bartholomew Fair*, by Henry Morley, was published in London in 1859.

BARTHOLOMEW'S (ST) DAY (Fr. *La St.-Barthélemy*; Ger. *Bartholomäusnacht*, i. e., Bartholomew's Night, or *Bluthochzeit*, i. e., Blood-wedding), the appellation given to the massacre of the Protestants in Paris on the night of St B. D., between 24th and 25th August 1572. After the death of Francis II. in 1560, Catharine de' Medici (q. v.), as

regent for her son, Charles IX., a minor, in order to annoy the Catholic party of the Duke Francis of Guise (q. v.), had granted an edict of toleration to the Reformed, at whose head was the Prince of Condé. Both parties took up arms, and there ensued a war which lasted for eight years, the cruelties of which, through mutual exasperation, are almost incredible. The Duke Francis of Guise was murdered by an assassin, and the Prince of Condé was taken prisoner in the battle of Jarnac, in 1569, and shot. The young Prince Henry of Bearn, afterwards King Henry IV., a nephew of Condé, then became leader of the Reformed, along with Admiral Coligny (q. v.). It was not till the strength of both sides was exhausted, that the peace of St Germain-en-Laye was concluded in 1570, whereby the Reformed obtained the free exercise of their religion. Catharine de' Medici now expressed much friendliness towards the Reformed, and even endeavoured to lull them into negligence by the marriage of the youthful Henry of Bearn with her daughter Margaret, 18th August 1572. Admiral Coligny was drawn to Paris, and the king not only made him costly presents, but gave him an important office in the council of state. However, all this was only the basest hypocrisy. When, by means of the marriage of Prince Henry, the most eminent of the Reformed had been allured to Paris, Admiral Coligny was wounded by a shot from a window of the palace on 22d August 1572. The king, indeed, hastened to him, and swore to avenge him; but, on the very same day, the king was persuaded by his mother that the admiral sought his life. 'By God's death!' he exclaimed, 'let the admiral be slain, and not him only, but all the Huguenots, till not one remain that can give us trouble!' That night, Catharine held a council, and appointed St B. D. for carrying into effect the long-contemplated massacre. After Coligny had been murdered, a bell in the tower of the royal palace, at the hour of midnight, gave the signal to the assembled companies of citizens for a general massacre of the Huguenots. The king himself fired from his palace upon those that were fleeing past. The Prince of Condé and the king of Navarre only saved their lives by going to mass, and appearing to conform to the Catholic Church. The provinces were at the same time summoned to similar slaughter; and although in some of them the officials were ashamed to publish the murderous commands which had been transmitted to them, there were found bloodthirsty fanatics enough, who perpetrated the greatest horrors for several weeks together in almost all the provinces, so that it was reckoned that 30,000 (some authorities make the number 70,000) persons were murdered. The pope celebrated the events of St B. D. by a procession to the church of St Louis, a grand *Te Deum*, and the proclamation of a year of jubilee. Many of the Huguenots fled to pathless mountains and to La Rochelle, to which the Duke of Anjou laid siege. Upon receiving intelligence, however, that he had been elected king of Poland, he made an arrangement on July 6, 1573, according to which the king granted to the Huguenots an amnesty, and the exercise of their religion in certain towns.

BARTHOLOMEW'S (St) HOSPITAL, Smithfield, London, was originally a part of the priory of St Bartholomew, founded in 1102 by Rahere, the first prior. At the dissolution of the religious houses, it was founded anew by Henry VIII., and the endowment has been subsequently enlarged from various sources, public and private. The hospital contains more than 600 beds, and affords relief to 70,000 patients annually. There is a medical school attached. The revenues are large and ample.

BARTIZAN, a small stone closet, thrown out upon corbels over doorways, and on other parts of mediæval castles, generally for defence, but sometimes only for convenience to the inmates and defenders.

Bartizan.

BARTLETT, William Henry, an artist and popular writer, was born at Kentish Town, London, on the 29th March 1809. He was a pupil of the eminent architectural antiquary, Mr John Britton, of London, and during his apprenticeship displayed more than ordinary talent for drawing, which was fostered by his master sending him into many of the most interesting counties in England, to make sketches from nature. Mr Britton afterwards employed him to make drawings for his *Cathedral Antiquities*, and also for his *Picturesque Antiquities of English Cities*. Subsequently, B. visited the continent, the Holy Land, and America several times, on each occasion enriching his portfolio with innumerable interesting scenes. No fewer than nineteen quarto volumes, containing about 1000 engravings from his sketches, and letterpress from his own pen and those of his fellow-travellers, Dr W. Beattie, N. P. Willis, and Miss Pardoe, were devoted to these countries. Several other volumes, of which he was the sole author as well as artist, have also been published. Some of the books had a wonderful success, especially those on Switzerland, the Holy Land and Egypt. B. died on the voyage from Malta to Marseille on September 25, 1854. He had been revisiting Palestine, and the materials he had collected were given to the world in a posthumous volume entitled *Jerusalem Revisited*.

BARTLETT is also the name of several American authors, the most eminent of whom is John Russell B., born at Providence, Rhode Island (U. S.), in October 1805. He was employed by the United States' government, in 1850— a commissioner for determining the Mexican boundary-line, and, in 1854, published an account of his explorations and adventures, &c., in that country. He is also the author of *The Progress of Ethnology*, a popular *Dictionary of Americanisms*, *Bibliography of Books relating to the Civil War*, and other works.

BARTOLINI, Lorenzo, a celebrated sculptor, was born at Vernio, in the north of Italy, in 1777. Circumstances brought him to Florence still a young man, where he practised his art for some time with very little pecuniary success, but at length, having obtained an academy prize for a bas-relief of Cleobis and Biton, he was successfully ushered into notice and prosperity. Several influential persons patronised him, such as the Cardinal Reginauld de St Jean d'Angely. Through the latter he obtained a commission to execute a number of bas-reliefs in the hall of the Vendôme palace, and also the bust of Napoleon over the door of the Institute of France. Napoleon himself ordered a multitude of orders, many of which, however, were never executed. In 1808, the emperor sent him to Carrara, to establish a school of sculpture. Here he remained till 1814, when he followed his imperial master to Elba. After the battle of Waterloo, he repaired to

subsequently appointed director of the sculpture department in the Academy of the Fine Arts, an office he retained till his death in 1850. B. was a very prolific artist. Besides the works already mentioned, B. executed busts of Cherubini, Mehul, Madame Regnauld, a magnificent statue of Napoleon I. (now in America), several exquisite sepulchral monuments, such as that of Lady Stratford Canning in the cathedral of Lausanne, and various groups, the most celebrated of which are his 'Charity,' and 'Hercules and Lycus.' In England and France, his style is in general greatly esteemed; in Germany, it is less highly thought of. His figures are characterised by their truthfulness of proportion and classic repose, though they also possess a remarkably lifelike expression. After Canova, B. is reckoned the most distinguished Italian sculptor of modern times.

BARTOLOMEO, San, a town of Italy, in the province of Caputanata, with a population of 5400.

BARTOLOZZI, Francesco, an eminent engraver, was born in Florence about 1730. After practising his art under Wagner of Venice, he went to Rome, where he executed his admired plates from the life of St Nilus. He was afterwards commissioned by Mr Dalton, librarian of George III., to engrave a series of drawings by Guercino, and was induced by the same gentleman to settle in England. Here B. produced his spirited and highly finished engravings of the 'Virgin and Child' after Carlo Dolci, and 'Clytie' after Annibale Carracci, which entitle him to occupy the front rank in his profession. He also engraved numerous specimens of the works of his friend Giovanni Cipriani, of Michael Angelo, Cantarini, Cortona, &c., with equal truth and effect. B. likewise enriched Alderman Boydell's Shakspeare Gallery with many fine engravings. In 1802 he received a flattering invitation from the Prince Regent of Portugal, to take the superintendence of a school of engravers at Lisbon, whither he repaired three years afterwards, in his seventy-fifth year, and there resided until his death in 1818. He was the grandfather of Madame Vestris, the celebrated comedian.

BARTON, Bernard, an English poet, born 31st January 1784, in London. His parents were members of the Society of Friends, to the tenets of which body B. adhered through life. In 1810 he became clerk to a banking-house at Woodbridge, in which situation he continued until within two years of his death. His first poetical efforts, published in 1812 under the title of *Metrical Effusions*, brought him into correspondence with the poet Southey. *Poems by an Amateur* (1818), and *Poems* (Lond. 1820), increased his reputation, and gained him the friendship of Lamb and Byron. *Napoleon and other Poems* appeared in 1822, and was followed within five years by several other productions. All the poems of B. are pervaded by pious sentiment, and some passages display much natural tenderness and religious fervour; but he is, on the whole, rather a fluent, pleasant versifier than a poet. So early as 1824, a reading-club founded by him in Woodbridge collected the sum of £1200 sterling, and presented it to him. Some years before his death, he received, through Sir Robert Peel, a pension of £100 sterling. In addition to the works mentioned, he published *Fisher's Juvenile Scrapbook* (Lond. 1836), *The Reliquary* (Lond. 1836), and *Household Verses* (Lond. 1845). After his death, which took place suddenly, 19th February 1849, his daughter published *Selections from the Poems and Letters of Bernard Barton* (Lond. 1849).

BARTON, Elizabeth, commonly called 'the Holy Maid of Kent,' a wretched creature, subject to spasmodic nervous affections, during which she gave utterance to incoherent exclamations and phrases. About the year 1525, she was servant in a tavern at Aldington, in Kent; and the cunning priest of the parish seeing her in her paroxysms, on the strength of her misfortune conceived the idea of presenting her to the world as a prophetess. Under his directions, she played her part so well that not only the common people, but even men of intellect and education like Sir Thomas More, and Barham, the Archbishop of Canterbury, were deceived by her. The former, however, afterwards recognised her true character. She became a nun, and when, in 1532, Henry VIII. quarrelled with the court of Rome, she was induced to denounce loudly the king's separation from his first wife, and his marriage with Anne Boleyn, and even to prophesy his death. Being arrested by the king's command, along with her accomplices, she made before the judges a confession, which was afterwards publicly repeated before the people, of the fraud which had been perpetrated, and was sentenced to ecclesiastical penance and to imprisonment. She was afterwards accused of high treason, and executed along with some of her accomplices in 1534.

BARTON BEDS, a group of strata, composed of clay and sand, and forming part of the Middle Eocene formation, included in the Bagshot series (q. v.).

BARTON-ON-HUMBER, a town in North Lincolnshire, on the south side of the Humber, six miles south-west of Hull. It is a very ancient place, having been one of the chief ports of the Humber before the foundation of Hull. It was once surrounded by a rampart and fosse, as a protection against the incursions of the Danes and Saxons. The ferry across the Humber, on the great road from London to Hull, used to be here; but the London and Hull inland traffic has now been diverted from B. by the steam-ferry at New Holland, six miles below Barton. The chief manufactures are ropes, sacking, bricks, tiles, pottery, and whiting. There are quarries of chalk and oolite. The tower of St Peter's Church, which was built about the time of the Conquest, has both round and pointed arches; and, with the part of the building to the west, constitutes one of the few existing examples of undoubted Anglo-Saxon architecture. St Mary's Church is a handsome structure of the 14th c. Pop. (1871) 4332.

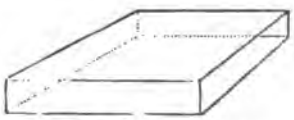
BARU, a fine woolly substance found at the base of the leaves of the *Sagueres saccharifer* (also called *Arenga saccharifera*), one of the most valuable sago-palms of the Indian Archipelago. It is much employed in calking ships, in stuffing cushions, and for other similar purposes.

BARUCH (i. e., the Blessed), the son of Neriah, was the person to whom the prophet Jeremiah dictated his oracles. During the siege of Jerusalem by Nebuchadnezzar, both he and the prophet were, by their own countrymen, shut up in a narrow prison, but obtained from the conqueror freedom and permission to choose their own residence. B. remained for some time in Palestine, but afterwards accompanied Jeremiah to Egypt. His subsequent history is unknown. An apocryphal work in the Greek language has come down to us under his name—viz., the Book of B., which contains words of comfort for the Israelites, and predicts the rebuilding of Jerusalem. There is usually appended to it, as chapters vi. and vii., a letter—also apocryphal—of the prophet Jeremiah to the exiles in Babylon.

BARWOOD. See Camwood.

BARYTA, or **BARYTES**, or Oxide of Barium (q.v.)—symbol BaO—is the earth present in the minerals *witherite* (carbonate of B.) and *heavy spar*

(sulphate of B.). It may be prepared in several ways: 1. By acting upon the carbonate of B. ($BaOCO_2$) by nitric acid (NO_3), which causes the disengagement of the carbonic acid (CO_2), and the nitric acid combining with the B. forms the nitrate of baryta ($BaONO_5$). On evaporating the latter substance to dryness, and igniting the residue, the nitric acid volatilises, and leaves the baryta (BaO). 2. Another mode of preparing the same substance is to act upon a solution of sulphuret of barium (BaS) by the black oxide of copper (CuO), when an interchange of elements occurs, the sulphur uniting with the copper, producing sulphuret of copper (CuS), and the oxygen with the barium, forming B. (BaO), which remains dissolved in the water, and, on evaporation, deposits crystals in the hydrated condition (BaO,HO). B. belongs to the group of alkaline earths, and has the property of acting like an alkali (q. v.) on colouring matters. It has a very harsh taste, is highly caustic, and is very poisonous. A solution of B. is used by the chemist as the best indication of the presence of carbonic acid gas in the atmosphere, for when a plate or other vessel containing the solution is exposed to the air, the carbonic acid floating across the surface combines with the B., and forms a film of white carbonate of baryta (BaO,CO_2). Otherwise, B. possesses little interest, as it is not put to any commercial or medicinal use. The compounds of B. are, however, of considerable importance. The *sulphate of B.* ($BaOSO_3$), otherwise called *ponderous* or *heavy spar*, is found in the mineral kingdom, diffused in fissures or cracks,



Crystal of Sulphate of Baryta.

passing through other rocks, especially in Cumberland, Durham, and Westmoreland, and in the island of Arran. At the latter place, an extensive mine of heavy spar has been worked for many years. In its native condition, the sulphate of B. occurs of a crystalline texture, is sometimes found pure and white, but generally presents a flesh-red colour, from the red oxide of iron (rust) incorporated in it. The rust can be got quit of by reducing the sulphate of B. to a fine powder under rollers or travelling-wheels, and subjecting the pulverised material to the action of dilute sulphuric acid, which dissolves the red oxide of iron, and leaves the sulphate of B. as a white dense powder. The principal use of *heavy spar* is as a pigment under the name of *permanent white*; but having little opacity, it cannot be employed by itself, but only when mixed with ordinary white lead. When added to the latter, however, it must be regarded as an adulteration, for the little opacity it possesses renders it of service only as an increaser of the bulk of the white lead. Several mixtures of sulphate of B., and white lead are manufactured, and are known in commerce. *Venice White* contains 1 part Sulphate of B., and 1 part White Lead. *Hamburg White* contains 2 parts Sulphate of B., and 1 part White Lead. *Dutch White* contains 3 parts Sulphate of B., and 1 part White Lead. The native sulphate of B. has been employed by the celebrated potter Wedgewood in the manufacture of jasper ware, and for the formation of white figures, &c., on coloured jars and vessels. The *Carbonate of B.* found native as *Witherite*, and the *Nitrate of B.*, have been previously referred to in this article and that on BARIUM.

BARYTON (Viol di Bardoni), an old chamber-instrument, somewhat like the viol di gamba in tone: had a broader finger-board, with seven gut-strings, while under the neck there were sixteen strings of brass wire, which were touched with the point of the thumb, to produce a sound, while the gut-strings were acted on by a bow.

BARYTON, that species of the human voice which lies between the bass and the tenor, the tone-character of which is more allied to the bass.

The compass of a B. voice is from but the principal notes of the voice are from  ; and these should possess the energetic character of a bass voice, and, above all, be produced from the chest, excepting perhaps the highest. In former times, the music for this species of voice was written on a stave with the F clef placed on the 3d line, thus:

BAS, or **BATZ**, a small island in the English Channel, belonging to France, and situated off the north coast of the department of Finisterre. Its length is about 3 miles, and its breadth 2. It has a light-house, in lat. 48° 45′ N., and long. 4 1¼ W., on an elevation 223 feet above the sea, and is defended by two forts and four batteries. Pop. above 1000, whose chief occupation is fishing.

BASA'LT, strictly a variety of trap-rock (q. v.), although some writers use the words as synonymous. It is composed of the same materials as greenstone (q. v.), and other varieties of trap, viz., hornblende and felspar, with a small quantity of iron; but these exist in a state of finer division than in greenstone, shewing that the crystalline action has been stopped at its commencement by the more rapid cooling of the mass. To this is owing its sharp conchoidal fracture and its hardness. As the hardness is frequently accompanied with tenacity, it makes B. a valuable material in the making of roads. It is of a more uniform dark-gray colour, approaching to black, than the other varieties of trap.

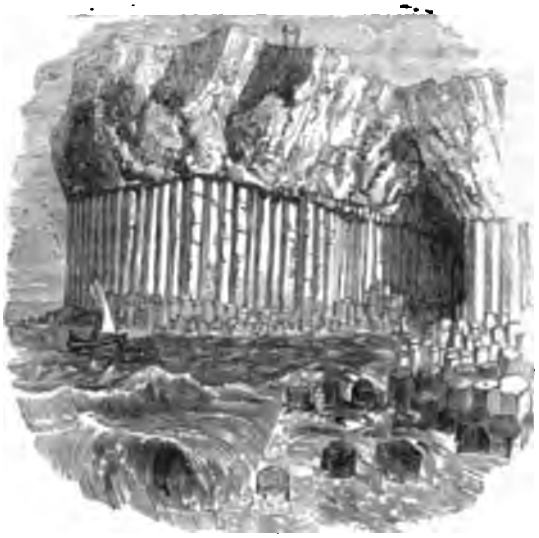
A rock of a similar appearance and structure occurs as a variety of lava, in volcanic districts. This Lava-B. differs from the older Trap-B. in the form which the silicates of magnesia and lime assume when crystallising. In the newer rocks, they appear as augite; in the older, as hornblende. These two minerals can scarcely be distinguished by their chemical composition, the different formulas given by mineralogists being the result of the presence, in the specimen analysed, of accidental ingredients or impurities. The slightly differing crystallographic angle has been accounted for by the supposed more speedy cooling of the volcanic rocks. Rose, indeed, has shewn that the hornblende of melted greenstone, in re-cooling, crystallises as augite; and we have observed that the same change has taken place in specimens of recrystallised B., obtained from works which existed lately at

Basalt section.

Birmingham for converting this rock into an opaque glass for various economic uses.

The remarkable columnar structure which B. frequently assumes, is its most striking characteristic. The columns vary in the number of their angles from three to twelve; but they have most commonly from five to seven sides. They are frequently divided transversely by joints at nearly equal distances. The direction of the columns is always at right angles to the greatest extension of the mass, so that when B. occurs as a bed, either overlying, or interstratified with the regular strata, the columns are perpendicular, while they are horizontal when the B. exists as a dike.

The columnar structure was at first believed to be owing to a modification of the crystalline force. Such a supposition was favoured by the external form of the columns; but the total absence of internal structure shewed that the explanation must be sought elsewhere. In 1804, Mr Gregory Watt propounded a theory of the origin of the structure, ascribing it to the pressure of numerous spheres



Fingal's Cave.

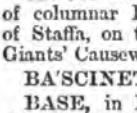
on each other, during the process of cooling, such spheres being produced in planes of refrigeration or absorption. They increase by the successive formation of external concentric coats, until their growth is prevented by the contact of neighbouring spheres; and as in a layer of equal-sized spheres, each is pressed on by six others, the result is that each sphere will be squeezed into a regular hexagon. Watt published this theory as the result of his celebrated observations on the cooling of a mass of molten basalt, in which he noticed the production of numerous spheroids, having a radiate structure. Many greenstones, in weathering, present such a structure, giving often to the rock the appearance as if it were composed of a mass of cannon-balls, and Watt's experiments satisfactorily explain this phenomenon; but they will not go further. Anxious, however, that they should throw some light on the structure of basaltic columns, he manages it by the following remarkable assumption: 'In a stratum composed of an indefinite number in superficial extent, but only one in height, of impenetrable spheroids, with nearly equidistant centres, if their peripheries should come in contact in the same plane, it seems obvious that their mutual action would form them into hexagons; and if these were resisted below, and there was no opposing cause above them, it seems equally clear that they would extend their dimensions upwards, and thus form hexagonal prisms, whose length might be indefinitely greater than their diameters. The further the extremities of the radii were removed from the centre, the greater would be their approach to parallelism; and the structure would be finally propagated by nearly parallel fibres, still keeping within the limits of the hexagonal prism with which their incipient formation commenced; and the prisms might thus shoot to an indefinite length into the undisturbed central mass of the fluid, till their structure was deranged by the superior influence of a counteracting cause.' Unfortunately, such dreams too often meet with more acceptance than the drier deductions from observed facts; which must, however, in the end, form the only basis of all geologic science. But there is no occasion here to urge even the most imaginative to resort to hypothesis, for the formation of columns in other substances than B. is quite familiar, and their producing causes evident. In starch, columns having the external prismatic appearance, and the internal earthy structure, are produced simply from the escape of vapour, and consequent shrinking of parts. We have seen singularly regular joints produced in the argillaceous ironstone at Wardie, near Edinburgh, on its exposure on the beach, the contractions forming the columns evidently resulting from the escape of the moisture retained by the bed while it was covered by other strata. The same occurs in beds of fine clay that have been recently exposed. But the most regular series of columns that have been noticed by us, were produced on bricks which formed the bottom of a public oven. The long-continued and powerful heat to which they had been subjected, though it had not caused fusion, had

so affected them as to produce a beautiful series of regular hexagonal prisms. The columns had a diameter of nearly half an inch. Their direction was at right angles to the oven floor. The earthy structure of the brick remained. The columns, in short, were in every respect, except the material of which they were formed, true basaltic columns. It is surely better to look for an explanation of this structure in causes similar to those which have produced the examples adduced, than to find it in such groundless assumptions as are at the foundation of the generally received theory of Watt. The columnar structure of B. seems to have been produced subsequently to the cooling of the mass, by changes in the solid rock, probably from the escape of some volatile matter.

The two best known and most beautiful examples of columnar B. are Fingal's Cave, in the island of Staffa, on the west coast of Scotland, and the Giants' Causeway, on the north coast of Ireland.

BA'SCINET. See HELMET.

BASE, in Heraldry, the lower portion of the shield is called the B.; there is a dexter base, middle base, and sinister base, marked by the letters



Base.

G, H, I, in the accompanying diagram, in which, for the convenience of the heraldic student, the other points of the escutcheon are also indicated. The *chief* or principal part of the escutcheon is the top, marked A, B, C. The *dexter* or right-hand side is that marked AG; the *sinister* or left-hand side, CI, an arrangement which is explained when we consider that the shield is always supposed to be on the arm of the wearer, and that it is his right and left hands, not those of the spectator, which are kept in view. The *ground* or surface of the shield, on which all the *charges* or figures are depicted, is called the *field*.

IN BASE.—When any figure is placed in the B. part of the shield, it is said to be *in base*.

BASE (Fr. and Ital.), the foot or lower member of a pillar, on which the shaft rests. Of the classical orders, the Doric column alone had no base. The height of the B. is usually about half the lower

Tuscan Base.

diameter of the shaft; and it is divided into the *plinth*, or flat projecting square block or blocks, immediately above the ground, and the *mouldings* (q. v.), or fillets, which surround the column, and are usually circular. In the early Norman style, the bases of pillars still retained, from the Romanesque, forms closely resembling the Tuscan order. As Gothic architecture advanced, and emancipated itself from the arbitrary rules by which the classical orders were governed, bases became infinitely varied in detail, though something approaching to the original conception of a strong and firm foundation for the column, adhered to them throughout.

BASE, in Chemistry, is a term applied to a compound body, generally consisting of a metal united with oxygen. Thus, the metal potassium (K), when it combines with oxygen (O), forms the B. potash (KO); sodium (Na) and oxygen, the B. soda (NaO); lead (Pb) and oxygen, the B. oxide of lead or litharge (PbO). A distinguishing feature of B. is that it unites with an oxygen acid, such as sulphuric acid (SO_3) to form a *salt* (q. v.). Thus, the B. potash (KO) combines with sulphuric acid (SO_3) to make the salt sulphate of potash ($KOSO_3$); potash with nitric acid (NO_5) to form the salt nitrate of potash, or nitre ($KONO_5$). Occasionally a B. replaces the oxygen in a base. Thus, the metal potassium (K) unites with sulphur (S) to form a *sulphur* base, sulphuret of potassium (KS), which can unite with a sulphur acid like sulphuret of arsenic acid or orpiment (AsS_3) to make the salt sulphoarsenite of potash (KS,AsS_3). The metal half of a B. need not be a simple element, but may be a compound body which, for the time, plays the part of a simple substance. Thus, the compound ethyl (C_4H_5) can combine with oxygen to form ordinary ether ($[C_4H_5]O$); and the B. thus produced can, in its turn, combine with acids to form salts. A base may be soluble or insoluble in water. Thus, the bases potash (KO), soda (NaO), ammonia (NH_4O), baryta (BaO), strontia (StO), lime (CaO), and magnesia (MgO), are more or less soluble in water; whilst the oxide of iron or rust (Fe_2O_3), the red oxide of lead (Pb_3O_4), the red oxide of mercury (HgO), are insoluble in water, but soluble in acids. See CHEMISTRY, in SUPP.

BASE, or BASS (from *basis*, the foundation), in Music, is the deepest or lowest part, by whatever instrument it may be performed. The B., next to the upper part, is the most striking, the freest in its movements, and richest in effect. Its movement downwards is unfettered, unconcealed, and undisturbed, whereas the middle parts are circumscribed and concealed. In respect to harmony, the B. is the most important part in music, containing more frequently the fundamental notes of the chords, while on it is formed that most important and effective figure in music called 'organ-point' (q. v.).—B. is also the name of the lowest and deepest quality of the human voice. The compass of a B. voice is

generally from  , which should all be

chest-notes, except, perhaps, the highest.

useful range, however, is from 
the characteristic use of the B. voice, the old masters were unquestionably the greatest, especially Handel and Bach. The B. voice only begins to shew itself at the years of manhood, and is generally a change from the alto voice of a boy.—B. is also the name of an old stringed instrument, with from five to six strings, tuned variously to suit the music, and played with a bow. It was a sort of middle instrument between the contra-bass and violoncello, but is now out of use. Double B. (contra-bass) is the deepest toned of stringed instruments.

BASE OF OPERATIONS, in Military enures, is some spot or line which the gene army relies upon as a stronghold and army cannot take with it all the f... ammunition for a long war; the co enormous, and a constant supply is i... Again, the sick and wounded cannot acco... army through toilsome marches; the co endeavours to send them back to a safety. Furthermore, fresh troops mu... spot from which they can safely advance enemy's country. To secure

B. of O. is necessary. It may be a port, a stretch of sea-coast, a river, a mountain-range, according to circumstances; but it must be such as to serve as a magazine of supply, a place for retreat under disaster, and the end of a line of open communication extending to the spot occupied by the army. When Lord Raglan and Marshal St Arnaud advanced from the Alma towards Sebastopol, in September 1854, they intended to attack the great fortress on the north side; but the tactics of the Russians prevented this; and the allies, changing their plan, resolved on the celebrated flank-march to Balaklava, by which they secured the whole coast from Balaklava to Kamiesch as a *B. of O.* during the siege of Sebastopol. See BALAKLAVA. In the military contests arising out of the Indian mutiny, in 1857 and 1858, Cawnpore was the chief B. of O. whence Havelock, Outram, and Clyde made those advances towards Lucknow which led ultimately to the suppression of the revolt. In the Italian war of 1859, the Austrian B. of O. was very fluctuating, owing in part to the disaffected state of the Lombard population around the great fortresses of Mantua, Peschiera, &c.; and indeed the only reliable base was furnished by the Eastern and Tyrolese Alps. The French and Sardinian base, in the same war, was virtually Genoa, and the line of country extending thence to the great stronghold of Alessandria.

BA'SE-COURT (*basse-cour*), the outer court of a feudal mansion, which contained the stable-yard and accommodation for servants. It was distinct from the principal quadrangle, and was sometimes constructed of timber.

BA'SEDOW, JOH. BERNH. (properly, Joh. Berend Bassedau, or Bernh. von Nordalbingen, as he is often called), a remarkable educationist of the 18th c., was born, 8th September 1723, at Hamburg, where his father was a peruke-maker. He attended the Johanneum there from 1741 to 1744, and afterwards studied philosophy and theology in Leipsic, from which he went in 1746 as a private tutor to Holstein. In the year 1753, he was appointed a master in the academy for young noblemen at Sorõe. In 1761 he was removed from the Gymnasium at Altona on account of heterodox opinions. Rousseau's *Emile* awakened in him, in 1762, the thought of improving the method of education, and of reducing to practice Rousseau's maxims and those of Comenius. Contributions from princes and private persons, amounting to 15,000 thalers (about £2171 sterling), covered the cost of his *Elementarwerk*, which, after the most pompous announcements, appeared as an *Orbis Pictus*, with 100 copper-plates by Chodowiecki, and was translated into French and Latin. Therein the young receive a large number of representations of the actual world, whereby B. sought at once to delight the eyes, and to awaken a sentiment of cosmopolitanism, at which his whole method aimed. As a model school on this method, he established in 1774 the *Philanthropin* at Dessau, to which place he had been called in 1771. His restlessness of disposition, and the quarrels in which he was involved, especially with his active but capricious coadjutor Wolke, caused him to leave the Philanthropin; but he proceeded with as much eagerness as ever in endeavours to give effect to his ideas by educational works, which, however, aimed more at popularity than solidity, until, after many changes of residence, he died at Magdeburg, 25th July 1790. His influence on the public mind of his age, particularly in Germany, was very great. He has been justly reproached with disparaging the ancients, a consequence chiefly of his own want of sound scholarship, and with a multitude of exaggerations, mistakes, and conceits; yet it cannot be disputed that his numerous philosophical and educational works powerfully awakened attention and interest in the much-neglected subject of education, and that he set many excellent ideas and weighty truths in rapid circulation among men.

BA'SEL, or BA'SLE (Fr. *Bâle*), a city and canton of Switzerland. The canton was divided in 1833 into two sovereign half-cantons, called *Basel-city* (Basel-stadt, or Basle-ville) and *Basel-country* (Basel-landschaft, or Basle-campagne), each having half a vote in the diet. The half-canton of Basel-city consists only of the city, with its precincts, and three villages on the right bank of the Rhine; the remainder of the canton forms the half-canton of Basel-country. The canton of B. is bounded by France and Baden, and by the cantons of Aargau, Soleure, and Berne, and has, according to different estimates, an extent of from 170 to about 200 square miles. Lying on the northern slope of the Jura, it is a country of hills and valleys. The mountains attain an elevation of from 2000 to 3000 feet. The chief rivers of B. are the Rhine (which flows through the north part of the canton) and its tributaries, the Birz, and Ergloz. The soil is fertile and well cultivated. The climate, except in elevated situations, is very mild. The inhabitants are chiefly employed in agriculture, the cultivation of fruit-trees and of the vine, cattle-husbandry, fishing, salt-works, the manufacture of ribbons (which are manufactured to the value of £400,000 sterling annually), paper, woollens, linens, and leather. The transit trade is very considerable.

The city of B. arose out of the Roman fortified post of Basilia or Basiliana, near Augusta Rauracorum, of which once more important place the little village of Augst, near B., exhibits a few ruins. On the division of the Frank Empire, the district of B. fell to Louis or Ludwig the German. The Emperor Henry I., in the earlier part of the 10th c., rebuilt the town, which had been destroyed. It then became a place of importance, and belonged for a time to Burgundy, but after 1032 formed part of the German empire. It became at an early period the seat of a bishop, who, from the 11th c., shared in the supreme power with the imperial governor, a number of noble families, and the burgesses. Amidst many internal and external disturbances, the power of the nobility was gradually broken, that of the bishop restricted, and the authority of the burgesses extended. Surrounding towns were also destroyed, or conquered, and purchased, along with their territories, so that the city extended its dominion over a country district which until very recently was kept in a state of dependence and subjection. Involved in many feuds with the House of Hapsburg, B. closely allied itself to the Swiss confederacy; and after the peace between the Emperor Maximilian I. and the confederacy, B. formally joined it in 1501. From 1519 onwards, the writings of Luther were printed in B.; and at the end of twenty years from that time, the reformed doctrine had become generally prevalent, the chapter of the cathedral had left the city, and the convents had been suppressed. After the union with Switzerland, the triumph of the burgess party became also more complete, part of the nobility emigrated, and those who remained were placed upon the same level with the freemen of the municipal corporation. Orderly industry, economy, and an external severity of manners, became the characteristics of the citizens; but the peace of the city was not unfrequently disturbed by strifes consequent upon the assertion of what was deemed undue authority by the magistrates. The government of the city, to which the whole canton was subject, was intrusted to a Great and a Little

Council, under the presidency of alternate burgomasters and chief wardens of the guilds; but the Little Council, uniting legislative and judicial functions with the highest executive authority, became gradually more and more preponderant. All parties in the city, however, remained always well combined against the country district; and persons belonging to the city were appointed to all offices, civil and ecclesiastical, whilst the depression of the country district was completed by the neglect of a proper provision for education. This state of things caused great dissatisfaction, which repeatedly broke out in fruitless rebellion. Under the impulse communicated by the French Revolution, equality of rights was conceded in 1798; but in 1814, although the equality of rights remained apparently intact, the new constitution of the canton was so framed, and the representation so distributed, as virtually to make the city again supreme. The discontent of the country district became so great that, after unsuccessful attempts to obtain redress of grievances by petition, civil war broke out in 1831, which did not cease till the troops of the Swiss Confederation took possession of the canton, and the diet recognised the separation of the city and the country district, as sovereign half-cantons, in 1833. The constitutions of the two half-cantons are in most respects similar, and are framed on the basis of the old constitution, modified in accordance with the principle of universal suffrage. According to the census of 1871, the half-canton of Basel-city contained 47,760 inhabitants, of whom 34,457 were Protestants; and Basel-country, 54,127, of whom 10,245 were Roman Catholics. Each division sends one member to the diet, but they have only one vote between them, and that does not count at all when the deputies take opposite sides, which as a rule they do. The capital of Basel-country is Liestal. Since its separation from the city, more ample provision has been made for education, and there has been a rapid increase of material prosperity. Both Roman Catholic and Protestant clergy are paid by the state, and the parishes of the Reformed Church have received the right of choosing their own pastors.

The city of B. was much more populous in the middle ages than it is now. Its population in 1870 was 44,834. In the 14th c., the number of its inhabitants was greatly reduced by the plague, or 'black death' (q. v.), which raged in it with terrible severity, and is sometimes mentioned as the 'death of Basel.' It is well-built and clean, but its appearance does not proclaim it the wealthiest city in Switzerland, which, however, it is. Amongst its buildings are a cathedral, founded in the beginning of the 11th c., by the Emperor Henry II., and a bridge over the Rhine, built in 1226. The Rhine divides the city into two parts—Great B., on the south side, and Little B., on the north. B. is connected by railway with Strasburg on the one hand, and Berne, Lucerne, Zurich, &c., on the other. It has many benevolent and educational institutions, among which are an orphan asylum, and an institution for deaf mutes; a university, founded in 1459, which has a library of 50,000–60,000 volumes, and a very valuable collection of manuscripts, a numi-matological collection, a botanic garden, and a museum of natural history; the new museum, in which there are several pictures of the younger Holbein, who was long resident in B. (some accounts say, he was born here); a public library of 70,000 volumes. During the Reformation, the university was a central point of spiritual life, and it has numbered among its professors men of great eminence in learning and science, including Erasmus, who died here in 1536, and the mathematicians Euler and Bernouilli, who were natives of B.; but it is now little frequented. The population of the whole canton in 1870 was 82,217.

BA'SEL, COUNCIL OF, a memorable and important ecclesiastical council, held in the city of Basel. It was summoned by Pope Martin V., and his successor Eugenius IV., in accordance with an announcement made at the Council of Constance, and was opened on 14th December 1431, under the presidency of the Cardinal Legate Julian Cesarini of St Angelo. The hall in which it met is still shewn at Basel. It addressed itself to the reconciliation of the Hussites with the Roman Catholic Church, and to the reform of abuses in the church itself. But the first attempt to conciliate the Hussites, whom an army of crusaders had in vain sought to subjugate, was met with resistance by the pope, who not only refused his sanction, but empowered the cardinal legate to dissolve the council. The council strongly repelled the pope's pretension of right to dissolve it, and proceeded with its business. His injunctions, that it should remove to Italy, were equally disregarded. It renewed the decree of the Council of Constance, asserting the right of a General Council to exercise authority over the pope himself, and on his persevering to issue bulls for its dissolution, caused a formal process to be commenced against him, and cited him to appear at its bar. It assumed the papal powers, and exercised them in France and Germany, where its authority was acknowledged. It concluded a peace, in name of the church, with the Calixtines, the most powerful section of the Hussites, by the Prague Compact of 20th November 1433, granting them the use of the cup in the Lord's Supper. By this, the Emperor Sigismund was much helped in obtaining possession of Bohemia; and he in return sought to reconcile the council with Eugenius IV., who, being hard pressed by insurrections in the States of the Church, and afraid of losing his whole influence in France and Germany, solemnly ratified all its decrees, by a bull dated 15th December 1433. Desirous, however, of limiting the papal prerogatives, the council restored to the chapters of cathedral and collegiate churches the free right of election to stalls and benefices, of which the pope had assumed the right of disposing; and with a view to the reformation of gross abuses, restricted the power of granting interdicts, and prohibited *annats* and other grievous exactions. It left the pope the right to dispose of those benefices only which belonged to the diocese of Rome, and prohibited the bestowal of reversions to ecclesiastical offices. It also appointed punishments for certain immoralities in the clergy; and prohibited Festivals of Fools, and all the indecencies which had been commonly practised in churches at Christmas. It adopted decrees concerning the election of popes, and for the regulation of the College of Cardinals.

Eugenius, exasperated to the utmost, complained loudly to all sovereign princes. At this time, a prospect was opened up of the union of the distressed Greeks with the Church of Rome; and both the pope and the council endeavoured to make use of this for the advancement of their own interests and influence. Both despatched galleys for the Greek deputies, but through the intrigues of his agents, the pope was successful, and brought the Greek deputies to Ferrara. The Archbishop of Tarentum, a papal legate at B., circulated an ordinance in name of the council, and sealed with its seal, recommending Udine or Florence as the place of conference. The ordinance was a forgery, and this proceeding put an end to forbearance on the part of the council, which, on July 31, 1437, again cited the pope to its bar; and not only on his failing to appear, declared him contumacious, but on his opening an

opposition council at Ferrara, went so far as, on January 24, 1438, to decree his suspension from the functions of the popedom. His party, however, was so strong that this decree could not be carried into effect; and some of those who had been among the most influential members of the council, the Cardinal Legate Julian himself, and the greater number of the Italians, left B., and went over to his side. All the more resolutely did Cardinal Louis Allemand, Archbishop of Arles, a man of most superior understanding, courage, and eloquence, now guide the proceedings of the council, which, on May 16, 1439, declared the pope a heretic, for his obstinate disobedience to its decrees; and in the following session, formally deposed him for simony, perjury, and other offences. On this occasion, the holy relics which were in B. were deposited in the places from which the Spanish and Italian members of the council had disappeared; and the sight of them produced much emotion, and reanimated the courage of the assembly, still consisting of 400 prelates, priests, and doctors, mostly French and German. On November 17, 1439, the council, notwithstanding the still further diminution of its numbers, caused by the plague in B., elected Duke Amadeus of Savoy to be pope, who then lived as a hermit in Ripaglia, on the Lake of Geneva. He accordingly styled himself Felix V., but was recognised only by a few princes, cities, and universities. The Emperor Sigismund was dead, and even France and Germany, although they accepted the reforming decrees of the council, thought proper to remain neutral in the question regarding the popedom. The friendship of the Emperor Frederick III. strengthened the party of Eugenius; and the council gradually melted away, till careful only for personal security, its members, after three years of inactivity, held its last session at B. on May 16, 1443, and removed its seat to Lausanne. Here a few prelates still remained together under the presidency of Cardinal Allemand, till in 1449, after the death of Eugenius, and the resignation of the anti-pope Felix, an amnesty was offered to them by the new pope, Nicholas V., which they joyfully accepted. The B. reforming decrees are contained in no Roman Catholic collection of decrees of councils, and are held to be invalid by the canonists of Rome; yet they are of authority in canon law in France and Germany, where they were included in pragmatic sanctions, although their application has been modified by more recent concordats.

BA'SEL, TREATY OF. Basel gives its name to two important treaties of peace, concluded there on 5th April and 22d July 1795, between the representatives of the French Republic, Prussia, and Spain, by which Prussia withdrew from the coalition against France, took under her protection all the states of Northern Germany which should, like herself, relinquish the war in which the German empire was engaged, and also gave up to the victorious republic her possessions beyond the Rhine; whilst Spain gave up her portion of St Domingo, and prepared the way for that alliance with France which was afterwards productive of consequences so important.

BASE'LLA, a genus of plants, generally regarded as belonging to the natural order *Chenopodiaceæ* (q. v.), but by some botanists as the type of a distinct order, *Basellaceæ*. The species are all tropical. *B. alba* and *B. rubra* are known in Britain as stove biennials. They are plants with twining stems, in common use as pot-herbs in the East Indies, and cultivated in China. In the neighbourhood of Paris, they are raised on hot-beds, transplanted into warm borders, and furnish a substitute for spinach in summer. *B. rubra* yields a very rich purple dye. The great fleshy root of *B. tuberosa*, a South American species, also with a twining stem, is edible.

BA'SEMENT-STORY. See STORY.

BA'SHAN, or BATANÆA, a country of Palestine, stretching from Mount Hermon in the Anti-Libanus on the north, to the brook of Jabbok on the south, and bounded on the west by the Jordan, its eastern limits not being very clearly defined. Ashtaroth and Edrei were its chief cities, and the residence of its kings during the Amoritish dynasty. The last of its Amorite rulers was Og, who with all his sons was killed by the Israelites under Moses, at the battle of Edrei; and the half tribe of Manasseh settled in the land. The men of B. were remarkable for their stature, its pastures for their richness, and its sheep and oxen for their size and fatness. B. belonged to the tetrarchy of Philip, and afterwards to that of Agrippa II.

BASHAW' (Turkish, *bash;* Arabic, *basha;* Persian, *pasha*, the way in which the word is now commonly written) signifies head, or master, a Turkish title of honour given to viceroys, provincial governors, generals, and other distinguished public men. The term B. is also used to characterise a man of an arrogant and domineering disposition.

BASHEE' or BASHI' ISLANDS, a small cluster in the line between Luzon, the chief of the Philippine chain, and Formosa, the lat. and long. being respectively 21° N. and 122° E. Politically, they are a dependency of the Philippines, having been colonised by the Spaniards in 1783. Physically, they form a link in the vast archipelago which, from Formosa to Sumatra inclusive, connects the south-east of China with the west of Malacca. They were discovered in 1687 by Dampier, who called them the Bashi Islands, on account of the popularity among the islanders of an intoxicating liquor of that name.

BASHI-BAZOU'KS are irregular troops in the pay of the Sultan. Very few of them are Europeans; they are mostly Asiatics, from some or other of the pashalics in Asiatic Turkey. They are wild turbulent men, ready to enter the Sultan's service under some leader whom they can understand, and still more ready to plunder whenever an opportunity offers. During the Russo-Turkish war of 1854, &c., they had many encounters with the enemy in that kind of irregular warfare which the Russians intrust to Cossack horsemen; but the peaceful villagers had almost as much distrust of the B.-B. as of the Russians. When the British government resolved, in 1855, to take into pay a Turkish contingent, to aid in the operations of the war, they intrusted to General Beatson, an officer who had seen much Indian service, the collecting and drilling of a corps of bashi-bazouk irregulars; but it was a troublesome and unpleasant duty, and the war came to an end before the men were fit for service.

BASIDO'H, or BASSADO'RE, the principal station for British ships in the Persian Gulf, situated at the west end of the island of Kishm.

BASIE'NTO, or BASE'NTO, a river of Italy, which, rising in the Apennines, west of Potenza, flows in an east-south-east direction through the province of Basilicata to the Gulf of Taranto, which it enters 25 miles west-south-west of Taranto city. Near its mouth are the remains of the once famous city of *Metapontum*, where Pythagoras ended his days.

BA'SIL, surnamed THE GREAT, and called St B., one of the most eminent and eloquent of the Greek Fathers, was born about 329 at Cæsarea, in

Cappadocia; studied under the heathen philosophers at Athens, and became an advocate in his native city, but afterwards founded a monastic society; was ordained a presbyter in 362; and succeeded Eusebius as Bishop of Cæsarea in 370, in which office he continued till his death in 379. He resolutely resisted invitations to the court of Julian the Apostate, with whom he had contracted an intimacy as a fellow-student at Athens, and displayed great constancy when the Emperor Valens began to persecute him, on account of his opposition to Arianism. He was engaged in most of the controversies of his time, but conducted controversy in a peaceful and generous manner. His rules of monastic life are still followed in the Greek and other oriental churches, in which he is highly honoured as one of the greatest of saints. In the Roman Catholic Church, also, they are followed in a few convents, styled of the order of *Basilians*. The influence of B. was greatly felt in the promotion of monasticism throughout the West as well as the East, and to him is ascribed the introduction of the three universal monastic vows of obedience, chastity, and poverty. The best editions of his works are that of the Benedictines (3 vols., Par. 1721—1730, fol.), and that of the brothers Gaume (3 vols., Par. 1835—1840, 8vo); but the authenticity of many of the moral and ascetic pieces is doubtful. His anniversary is celebrated, in the Greek Church, on the 1st of January —the day of his death; in the Latin Church, on the 14th of June—the day of his ordination.

BA'SIL I., the Macedonian, Emperor of the East, was born in a village of Macedonia, in 813 A. D., or, according to others, in 826. His early life is differently related, but his biographers agree that he came to Constantinople when still a young man, and was appointed chamberlain to the Emperor Michael in 861. Subsequently, the emperor made him his colleague in the sovereignty. B. now used his influence to restrain Michael from committing those excesses which rendered him hateful to the people; but when he found his remonstrances unavailing, he headed a conspiracy against him, the result of which was the assassination of the emperor in 867. His first care was to heal the wounds both of the church and the state. He replaced Ignatius upon the patriarchal throne, and dismissed Photius, whom, however, he re-established in his authority the year after. His valour made him the terror of the Saracens, from whom he reconquered Asia Minor. The prodigality of Michael had exhausted the public treasury; by a wise economy, B. refilled it. All extortioners, moreover, were sought out and punished. The profligate companions of the late monarch were condemned to disgorge one half of the largesses which Michael had showered upon them. B. also entered into a treaty of alliance with the Russians of Kiew, to whom he sent missionaries to preach the gospel, and who, from that time, began to embrace Christianity, and acknowledge the authority of the Greek Church. He died in 886, from wounds which he received while hunting a stag. Several letters of his are still extant, besides a book full of wise advice addressed to his son.

BASIL (*Ocymum*), a genus of plants of the natural order *Labiatæ* (q. v.). The species are all natives of the tropics, or of the warmer temperate parts of the world, and are generally characterised by a pleasant aromatic smell and taste. They are reckoned among *sweet herbs*.—SWEET B. (*O. Basilicum*) is an annual plant, a native of the East Indies, about one foot high, with ovate or oblong leaves, and flowers in whorls of six, which has long been cultivated in Europe for culinary purposes, being used as a seasoning. It has also enjoyed the reputation of being a palliative of the pains of childbirth. BUSH B. (*O. minimum*), also a native of the Ea

Basil (*Ocymum Basilicum*).

Indies, is cultivated for the same p possesses the same qualities. It is a p six inches high, with an orbicular bushy Britain, the seed of both species, obtained south of Europe, is generally sown on a from which the plants are afterwards remov the open ground.—A native British plant same order (*Clinopodium vulgare*) bears th of WILD B., and another (*Acinos vulgaris*, merly *Thymus Acinos*) is known as B. Th Both are fragrant and aromatic.—B. Vinegar is in the same manner as Mint Vinegar, by steep the leaves in vinegar. It is used for seasoning winter, when the fresh plant cannot be obtained.

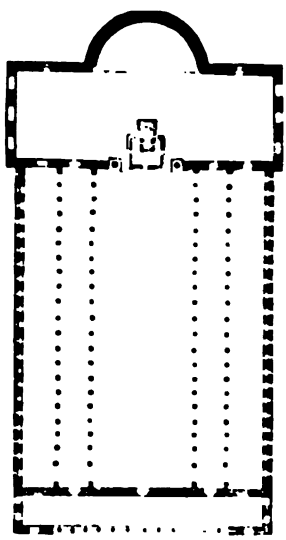
BASI'LICA, a code of laws of the Greek emp the compilation of which was begun in the re of the Emperor Basil I., the Macedonian, who d in 886—from whom it is generally supposed to h derived its name; completed by his son Leo, Philosopher; and revised, in 945, by order of stantine Porphyrogenitus, the son of Leo. is some doubt whether the work has come to us as completed by Leo, or as revised by C stantine, and unfortunately we do not p whole of the sixty books of which it consisted. It was very much an adaptation code of Justinian to altered circumstances, of great value for the interpretation of the *Juris*. The principal editions are that of (7 vols. fol., Par. 1647), and the re Heimbach (vols. 1—5, Leip. 1833— includes portions discovered since F. The B. has been the subject of many

BASI'LICA (Gr. *Basilikē*, fr king). Originally, the B. seems t hall or court-room in which the l the laws made by himself and the his council. When monarchy wa Athens, the second of the magistrates wh to the kingly power was called the

the first being styled the Archon by pre-eminence; and it is as the court or hall (stoa) in which the Archon-basileus administered justice, that the B. first appears in authentic history. But it was amongst the Romans that the B. attained its chief importance; and in addition to its original use as a court of justice, became a market-place, an exchange, a place of meeting for men of business generally. It was not till a comparatively late period, however, that a B. was erected at Rome. The first we hear of is the B. Porcia in 182 B.C. From this period till the time of Constantine, they were constructed in great numbers. Some twenty are known to have existed in Rome and latterly,

Section of Trajan's Basilica, Rome.

every provincial town, even those of small extent, had each its B., as that of Pompeii, which is now the most perfect example, still testifies. The most frequented part of the city was always selected for the site of a B.; and as this was almost always the Forum, the words Forum and B. are occasionally used as synonymous by ancient writers. The earliest basilicas were entirely open to the external air. It was usual, for this reason, as well as for the convenience of those who might be compelled to frequent them in bad weather, to select for them a sheltered and convenient position. Latterly, an external wall was substituted for the peristyle of columns with which the original basilicas were surrounded; the external columns, if continued at all, being used only as a decoration, and confined generally to the vestibule. It was in this form that the B. suggested the idea of the Christian Church, as has already been explained under Apse (q. v.); and the readiest mode of explaining the structure of the B. to a modern, is to imagine the process which was then performed reversed, and in place of converting the B. into a church, to convert the church into a basilica. This will be effected by simply removing the roof from the *nave*, the aisles remaining covered, and even being frequently furnished with galleries, as in Protestant churches. The judge's seat was generally in a circular portion of the building which protruded from its further end, in which the altar was afterwards placed (see APSE), the great entrance to the B. fronting it, as the western door of a cathedral fronts the high-altar. The space required by the prætor for his court was separated by a railing from the other portions of the building, which were devoted to the various purposes we have mentioned. It must not be supposed from this description, that the form of the B. was always the same. Sometimes there was no hemicycle or apse, as in the B. at Pompeii, in which case the tribunal was cut off from the nave; sometimes there were two, as in the B. of Trajan. Again, the B. was sometimes entered, not from the end, but from the sides, where the transepts of a modern church are situated; and at the end opposite that in which the tribunal was placed, there was often a row of small chambers, the uses of which do not seem to be very accurately ascertained, and probably were not invariable. In the plan of the B. of Pompeii, there was an outside stair which led to the upper gallery, which in this case passed entirely round the building. The gallery was the place to which loiterers usually resorted for the purpose of watching the business



Ground-plan of Basilica of St Paul, Rome.

proceedings below; and the one half of it is said to have been devoted to men, the other, to women. Of the vast size of some of these buildings, we may form a conception from the accommodation which must have been required for the tribunal alone, where, in addition to the curule chair of the prætor, and space required by the suitors and their advocates, seats had to be provided for the *judices* or jurymen, who occasionally amounted to as many as 180.

Many of the principal churches in Italy, and particularly in Rome, are still called Basiliche.

The term B. was also applied in the middle ages to the large structures erected over the tombs of persons of distinction, probably from their resemblance to small churches; thus, the tomb of Edward the Confessor, in Westminster, is called a B. (see chronicle of the Mayors of London, quoted by Parker).

BASILICATA, a former province in the south of the kingdom of Italy, now Potenza, includes nearly the same territory as ancient Lucania. Capitanata and Principato Ultra bound it on the N.; Bari and Otranto, on the N.E. and E.; the Gulf of Taranto and Calabria Citra, S.E. and E.; and the Principato Citra and the Mediterranean, on the W. Its area is 4000 square miles. Pop. (1871) 508,880. The capital is Potenza; the other chief towns are Francavilla and Tursi. B. lies mainly on the east side of the main ridge of the Apennines, between it and the Gulf of Taranto. The interior is wild and mountainous, and though there are some large forests in the province, the general aspect is bare and barren. Four considerable rivers—the Basiento, Brandano, Agri, and Sinno—flow through it from the west in an east-south-east direction, forming as many valleys, which slope gradually into an exceedingly fertile plain, varying in breadth from 4 to 10 miles. Here corn is raised in abundance, also wine, hemp, tobacco, and liquorice. Swine, sheep, and goats are reared in the mountainous districts, and silk forms a product of the valleys. B. is greatly in need of good roads, and is much subject to earthquakes.

BASI'LICON (Gr. 'royal,' or of great virtue), a name given to an ointment composed of yellow wax, black pitch, resin, and olive oil. Hence it was called *Unguentum Tetrapharmacum* (*tetra pharmaka*, four drugs). The resin, wax, and pitch are melted together over a slow fire; the oil is then added, and the mixture, while hot, strained through linen. The straining is directed in consequence of the impurities which resin often contains. B. ointment, or resin cerate, as it is sometimes called, is much used as a gently stimulant application to blistered surfaces, indolent ulcers, burns, scalds, and chilblains.

BASI'LICON DO'RON (Gr. royal gift), a celebrated prose work of King James VI. of Scotland, written for the instruction of his son, Prince Henry, a short time previous to his accession to the English throne. It consists of three books. The first treats 'Of a King's Christian Duty towards God;' the second, 'Of a King's Duty in his Office;' and the third, 'Of a King's Behaviour in Indifferent Things.' It was first published in 1599; afterwards in London in 1603, 8vo; and translated into Latin by Henry Peacham, who presented it, richly illuminated, to the prince. This Latin version was published in London in 1604, 8vo. A French edition appeared at Paris in 1603, 8vo, and another in 1604, 16mo. Like the royal author's famous work on *Demonology*, and his *Counterblast to Tobacco*, the *B. D.* is now only considered as a literary curiosity.

BASI'LIDES, an Alexandrian Gnostic, who flourished during the reigns of Trajan, Hadrian, and Antoninus Pius. Regarding his life, little is known. He is said to have taught in Antioch; afterwards in Persia; and, finally, in Egypt, where he is supposed to have died shortly before the middle of the 2d c. He was a disciple of one Glaucias, not elsewhere mentioned in history, but whom he terms an interpreter of St Peter, and from whom he alleges that he had received the esoteric faith of that apostle. B. probably considered himself a Christian, but his fantastic speculations bore a greater resemblance to the doctrines of Zoroaster, and in some points to the Indian philosophy, than to the religion of Christ. According to the system of B., there are two eternal and independent principles—the one, good; the other, evil. Whatever exists, emanates from these. The good principle—i.e., the Supreme God, or Father—constitutes, with his seven perfections, viz., the Mind, the Word, the Understanding, Power, Excellences, Princes, and Angels, the blessed ogdoad (combination of *eight*). These seven perfections, or powers, in which the Supreme God is reflected, are in their turn themselves reflected, but more feebly, in seven other angelic powers, which emanate from them; and so on through the whole circle of emanations, which amount to 365, the mystic number so often inscribed on the symbolic stones in the Gnostic schools (see ABRAXAS STONES). Each of these angelic powers governs a world. There are, consequently, 365 worlds, to each of which B. gave a name. The head of the 365th, or lowest world, rules the material universe, which, along with other angels, he also created. He is the God or Jehovah of the Old Testament, and when the earth was divided among the rulers of the material universe, the Jewish nation fell to the share of himself, who was the prince of the lowest class of angels. But wishing to absorb all power himself, he strove against the other angels, and to make them subject to his 'chosen people,' the result of which was war, strife, division in the world, together with the loss of the true religion, to restore which the Supreme God sent the first *Æon* (*Nous*, or Intelligence), who united himself to the man Jesus at his baptism, and so taught men that the destiny of their rational spirit was to return into God. This *Nous*, however (who was the true Christ), did not really suffer crucifixion, for, changing forms with Simon of Cyrene, he stood by *laughing* while Simon suffered, and afterwards returned to heaven. B. also taught the doctrine of a purgatorial transmigration of souls in the case of the wicked. His disciples (Basilidians) were numerous in Egypt, Syria, Italy, and even in Gaul, where they continued to exist till the 4th c. They were accused by their enemies of Antinomianism and 'magic,' but whether on good grounds or not, cannot be ascertained.

BA'SILISK, according to ancient and mediæval authors, a terrible creature, which, however, may be regarded as entirely fabulous—the fables concerning it being so many and so monstrous, that it is vain to seek for any foundation of truth, or to inquire if any of them originally had reference to any particular creature whatever. The ancients, as Dioscorides, Galen, and Pliny, des[cribe] it as a serpent: in the middle ages, it was [usually] represented as more of a lizard appe[arance], provided with eight instead of four fe[et], and to have been at last pretty e[xactly] with the Cockatrice (q. v.), [which] be generated in a very wo[nderful] produced from an egg laid [by a] cock, and hatched by a toad; [others] find the B. sometimes [with] cock's head. The B. [was] serpents, all of which [had] it approached; whence [the name], diminutive of *basileus*, a [king]—sometimes translated into Latin by *regu[lus]*. It [had] minences on its head, which, [as] in books, assumed very exactly a crown. It inhabited the de[sert], indeed, could only inhabit a [place] burned up all vegetati[on] bones of any animal w[hich] and its very look was [fatal]; could venture into [the] of a mirror, which [reflected] upon itself.—These t[ales] mentioned, were it o[therwise] to them by poets and other w[riters]. the B. was, of course, ext[inct]. cians. It occupies an im[portant] the legends of the sai[nts]. to have delivered [Rome] caused a deadly pe[stilence].

The word

times used in the Latin Vulgate, where the authorised English version of the Old Testament sometimes has *adder*, and sometimes *cockatrice*; but no trace of any of the marvels concerning the B. is to be found there.

BA'SILISK (*Basiliscus*), in modern Zoology, a genus of saurian reptiles of the family of *Iguanidæ* (see IGUANA), differing from the iguanas in the want of the dewlap or appendage of skin under the throat, and of the series of pores on the inside of each thigh; also in having a continuous elevated crest along the back and tail, capable of being erected or depressed at pleasure, and apparently intended to aid the motions of the animal in water like the corresponding fin of a fish.—The basilisks are remarkably adapted both for climbing trees and for swimming. Their feet are not webbed, their toes rather long. They are perfectly harmless creatures, very active and lively, and it is difficult to say why they should have received the name of the fabulous monster of antiquity, unless because their appearance is far from agreeable to those unaccustomed to it, and perhaps because an appendage at the back of the head may have been thought to represent the crown of the dragon king. This appendage is most conspicuously developed in the Mitred or Hooded B. (*B. mitratus*), a native of the tropical parts of America, and consists of a hood or membranous

Hooded Basilisk.

bag, capable of being dilated with air, and then about the size of a pullet's egg, which is supposed, notwithstanding its extremely different situation, to have a use somewhat analogous to that of the air-bladder of fishes. The mitred B. is from 25 to 30 inches long, including the long and very tapering tail. —Another and larger species, of a generally greenish colour (*B. Amboinensis*), inhabits the islands of the Indian Archipelago, and is much used there for food. Its flesh is said to be very white and tender. It is often seen on the branches of trees above water, into which it drops when alarmed.

BA'SIN, a geographical term of considerable importance. The *B.* of a river is the whole tract of country drained by that river, and is, of course, more or less concave. The line or boundary which separates one river-basin from another is called the water-shed. By tracing these water-sheds, the whole of a country or continent may be divided into a number of distinct basins; and this is one of the most instructive elements in the physical geography of a country. The *B.* of a lake or sea, again, is made up of the basins of all the rivers that flow into it.

BA'SIN, in Geology, is a term applied to depressions in the strata, in which beds of a later age have been deposited. Thus, the London B., consisting of tertiary sands and clays, occupies a hollow in the chalk, which is bounded by the North Downs on the south, and by the chalk-hills of Berks, Wilts, Bucks, and Herts on the north. The term has also been applied to synclinal depressions of strata, which have been produced by the elevation or depression of all the strata contained in the B., as the coal-B. of South Wales.

BA'SINGSTOKE, a town in the north of Hampshire, 46 miles west-south-west of London. It is a place of much activity, being situated at the junction of five main roads to London from the south and west of England. The country around is fertile and wooded. The chief trade is in corn, malt, coal, and timber. Near the town is a tract of 108 acres, on which every householder has the right of pasturage. There is also, not far from the town, an ancient camp, surrounded by an irregular oval embankment, 1100 yards in circumference, with an entrance on the east and west sides. Basing House Castle, belonging to the Marquis of Winchester, long withstood the forces of the Commonwealth, but Cromwell at last took it by storm, and burned it to the ground in 1645. Pop. (1871) 5574.

BA'SKERVILLE, JOHN, a celebrated English printer and letter-founder, was born in 1706 at Wolverley, in Worcestershire. He became a writing-master in Birmingham, and afterwards carried on the business of japanning there with great success. He began about 1750 to make laborious and costly experiments in letter-founding, and succeeded in making types which have scarcely yet been excelled. He printed an edition of Virgil at Birmingham in 1756, which was followed by other Latin classics, a few English and Italian authors, and a New Testament (Oxf. 1763), much admired as specimens of printing, although not otherwise possessing high merit. His services to the art of printing met with little encouragement and no requital. He died in 1775. He was a man of obliging disposition, but of a gloomy temperament, and condemned all religious service as superstition. B. was buried in a tomb of masonry in the shape of a cone, under a windmill, in his garden; but the ground becoming valuable for building purposes, his remains were exhumed in the summer of 1821, and deposited in the vaults of Christ Church, in the neighbourhood of the spot where they were originally interred. Baskerville editions of works are now prized by persons of taste.

BA'SKET (Welsh, *basgel*, or *basgawd*, a netting or weaving of splinters), a domestic utensil, usually made of willows, reeds, or chips, interwoven, although sometimes the materials are gold, silver, iron, glass, &c. Baskets have been in use from very early ages. The Israelites were commanded (Deuteronomy xxvi. 2) to offer unto the Lord, as soon as they came into possession of the land of Canaan, 'the first of all the fruit of the earth' in a *basket*. The baskets used on such occasions by the rich Jews were made of gold and silver, and were returned to the offerers; but those used by the majority of the people were of barked willow, and were retained by the priests. The ancient Britons were remarkably expert in the manufacture of baskets, which were much prized by the Romans for their neatness and elegance. The process of B.-making is very simple, and appears to be well known among the rudest peoples—even among the aborigines of Van Diemen's Land. In this country the willow is chiefly used in the manufacture of baskets. In several parts of England and Scotland, great attention is paid to the cultivation of the willow; and judging from the statements of some of the cultivators, the returns yielded are very satisfactory. One calculates his profits at £18, 10s. per acre, and another at £10 per acre. The tools required being few and inexpensive, a large number of poor persons are engaged in the manufacture of baskets, that are hawked about the streets by their wives and children. B.-making also forms a part of the industry of almost all blind asylums. Baskets are of all shapes and sizes, and their uses are so well known to all as to

obviate the necessity of description here. Baskets to the value of £30,000 or £40,000 are annually imported from the continent.

BASNAGE DE BEAUVAL, JAQUES, the most distinguished of a distinguished French family, mostly supporters of the Protestant cause, was the son of Henry Basnage, an able advocate in the parliament of Normandy, and was born at Rouen, August 8, 1653. Having studied theology at Geneva and Sedan, he became pastor of the reformed church in Rouen (1676). That church being interdicted in 1685, B. obtained leave to retire to Holland, where he finally settled as stipendiary minister of the Walloon Church in the Hague, having gained the friendship of the Grand Pensionary Heinsius. Here, while zealously discharging his religious duties, he was called upon to take an active part in state affairs, particularly in negotiating the defensive alliance concluded between France, England, and the States-general, 14th February 1717. Amid all these duties and distractions, B. cultivated literature with ardour, and was no less distinguished for his extensive learning than for the polish of his manners and the integrity of his character. B., who commanded in a singular degree the esteem both of Protestants and Catholics, died on the 22d September 1723.

His chief works, which have been frequently laid under contribution without being named, are *La Communion Sainte* (Rott. 1688), a work approved even by Catholics, and often reprinted; *Traité de la Conscience* (Amst. 1696, 2 vols.); *Histoire de l'Eglise* (Rott. 1699, 2 vols. fol.); *Histoire des Juifs* (Rott. 1706, 5 vols.), one of B.'s best productions, and translated into English by Th. Taylor (Lond. 1708); *Dissertation Historique sur les Duels et les Ordres de Chevalerie* (Amst. 1720).

BASQUE PROVINCES, a district of Spain, in lat. 42° 25′—43° 28′ N., and long. 1° 44′—3° 25′ W., and comprising the three provinces of Biscay, Guipuzcoa, and Alava, which constituted the ancient *Cantabria*. They form a sort of triangle, the base of which is the Bay of Biscay on the north, and the apex the town of Logrono in the south; the boundary-lines of Navarre on the east, and Santander and Burgos on the west, forming the two sides. The total area of the provinces is about 3000 square miles, and the population in 1867, 461,880. The surface of the B. P. is very mountainous, particularly that of Alava, which is everywhere cut up into deep narrow valleys by offsets from the main chain of mountains. The rivers of Biscay and Guipuzcoa, none of which are important, empty themselves after a short course into the Bay of Biscay; those of Alava flow down the opposite slopes into the Ebro, which carries their waters to the Mediterranean. The climate in all the three provinces is, on the whole, mild and salubrious. The general aspect of the country is very picturesque, the hills in most cases being covered with wood to the very summit. The principal trees are oak, beech, and chestnut. The fruit of the chestnut forms an article both of diet and of export. The soil in the valleys and plains, though not very rich, has been rendered productive by the energy of the people, who spare no labour in the cultivation. But as yet, science and machinery have done little or nothing to assist nature and manual exertion. A spade, or prong-fork, is the chief mechanical aid the Basque peasant has. The farms are small, usually only about four or five acres, and rarely more than can be managed by the farmer and his family. Notwithstanding, the roads and agriculture of these provinces contrast very favourably with those of Spain generally. The products are wheat, barley, maize, flax, hemp, &c.; the wheat, however, only ripening in the most favoured localities. Pasture-land occupies a considerable portion of the surface; and a poor wine, called *chacoli*, is made in large quantities, and forms the chief beverage of the inhabitants, who appear to relish it, although it is disliked by all travellers.

There are numerous rich veins of iron in the hills, which are extensively wrought; and copper and tin are also obtained, as well as marble of various kinds, porphyry, and jasper. The fisheries employ a goodly number of people on the coast, and many are engaged in the preparation of charcoal. The Basques are said to be the first Europeans who went to the whale-fishing.

The Basques are a simple, brave, and independent people, willing to undergo any hardships rather than surrender their mountain-freedom. None of their many invaders were ever able to effectually subdue or expel them. The B. P. still retain a separate constitution, guaranteeing them many political and fiscal privileges not possessed by the rest of Spain. They have freedom from conscription, and free-trade in salt and tobacco, upon which a heavy duty is levied in the adjoining provinces. The Basques are even prouder than Spaniards, and the mere fact of being born in their territory secures the privilege of 'universal nobility.' *Euscaldunac* is the name the Basques give themselves; their country they call *Euscaleria;* and their language, which is peculiarly their own, *Euscara*—the prefix *Eus* being 'the old *Osc*, *Esc*, *Vasq* of Italy and Iberia.' The origin of the Basques is doubtful. Humboldt considers them descendants of the ancient Iber, who once occupied the whole of the peninsula, and spoke the language now confined solely to the B. P.; while Mr Borrow's opinion is, that the language is of Tatar origin. The Basques are fond of music, and on their chief holiday, Sunday, they indulge in singing, dancing, and single-stick, which they enjoy immensely. For a more particular account of the B. P., we would refer to that excellent manual, *Ford's Hand-book of Spain.*

BAS-RELIEF. See ALTO-RILIEVO.

BASS. See BASE.

BASS ROCK, a remarkable island-rock near the mouth of the Firth of Forth, about 2 miles from Canty Bay, Haddingtonshire, opposite the ruined castle of Tantallon. It is composed of fine granular greenstone or clinkstone, and is about a mile in circumference, nearly round, and 350 feet high. It

Bass Rock.

is inaccessible on all sides except the south-east, where it shelves down to the water, and there the landing is difficult, and almost impossible, when there is any swell. On the west, north, and east,

the precipices rise perpendicularly out of the sea, often to the height of 200 feet. These are the abode of immense numbers of solan geese (it is estimated that 10,000—15,000 of these fowls resort here annually) and other aquatic birds, which give to the surface of the rock quite a snowy appearance in the distance. A huge cavern traverses the rock from north-west to south-east, and is accessible at low tide. There is a spring on the island, and a few sheep are pastured on it, the mutton of which is much prized. How early the Bass was tenanted, is doubtful; but there is a tradition to the effect that St Baldred resided on it as early as the 7th c. It is also not very certainly known when the Bass was first fortified, but it formed a retreat for the son of Robert III., afterwards James I. of Scotland, before his nineteen years' captivity in England. James VI. visited the Bass in 1581, and was anxious to obtain it for state purposes; but its owner, 'Lauder of the Bass,' refused to part with it. The Registers of the Church of Scotland were sent to the Bass in 1651, for preservation from Cromwell; but the Protector forced their surrender in the following year. In 1671, Charles II. purchased the rock for £4000, and within its dreary dungeons many of the most eminent of the Covenanters were confined during that and the following reign. It is a somewhat curious fact, that the Bass was the last spot in the British Islands which held out for the Stuarts. A mere handful of adventurers in the Jacobite interest, 24 in number, had the address to capture the island, and to retain it in name of King James, from June 1691 till April 1694, against all the forces which the government of William III. sent against them; at last, the spirited little garrison surrendered on honourable terms, and only from a consciousness of failing provisions. For an account of this romantic incident, see *Pictorial History of England*, vol. iv. p. 16, new edition. In 1701 the fortifications were demolished by order of William III. Five years afterwards, the Bass passed into the possession of Sir Hew Dalrymple, to whose lineal descendant it now belongs. The king of the Belgians (then Prince Leopold) visited the rock in 1819, and, three years afterwards, George IV., on passing it on his voyage to Scotland, was honoured with a royal salute from some guns then on it. The Bass is let to a 'keeper,' who pays a considerable sum for it annually, the rent being made up by the money obtained for the young geese, which are used as food, and by the fees exacted from visitors to the rock. There is an interesting volume on the Bass, historical, geological, and botanical, the joint production of Dr M'Crie, jun., Hugh Miller, and Professors Fleming and Balfour.

BASSA, or **BAFFA**, an excellent port on the Grain Coast, Guinea, formerly much resorted to by trading vessels for coarse pepper; latterly, for slaves. The country around produces lemons, oranges, and bananas in abundance.

BASSANO, a town of Italy, in the former province of Venice, 19 miles north-east of Vicenza, on the Brenta—population about 12,000. It is situated on a rising-ground in an extensive plain, and has a considerable trade in wine, olives, silk, leather, &c., as well as a great printing establishment. It has 30 churches, and a number of fine palaces. One of its gates, the work of Palladio, is greatly admired. It is famous for a victory of Bonaparte over the Austrian field-marshal, Wurmser, on 8th September 1796, and was the scene of other battles between the French and Austrians in the wars of that period.

BASSANO (or, more properly, GIACOMO DA PONTE), an artist of great eminence, was born at Bassano, in the north of Italy, in 1510. He was first educated in the principles of his art by his father, Francesco da Ponte, who was himself a painter of considerable merit, and afterwards visited Venice, where he became a pupil of Bonifazio Veneziano. Here he enjoyed opportunities of studying the designs of Parmegiano, Titian, Tintoretto, and others. The earlier stages of his professional career clearly indicate that these great painters had kindled a rich and emulative enthusiasm in B., for his works display a loftier genius, both as regards conception and execution, than at a later period. His principal effort, belonging to this higher epoch, is a fresco painted on the front of the house of the Michelli family. It represents Samson destroying the Philistines; the figure of the mighty Israelite being considered not unworthy of Michael Angelo. After his father's death, he returned to Bassano, where he devoted himself to a simpler style of art. From this time, however, dates his celebrity. He may even be said to have founded a school, whose peculiarity was the delineation of common things, markets, fairs, country inns, farm-yards, &c. He had a passion for introducing cattle into his pictures, even under the most inappropriate circumstances. The special merits of this lower style, into which B. finally lapsed, are its vigorous and picturesque colouring, and its accurate imitation of nature. B.'s landscapes, however, betray a comparative ignorance of perspective. Occasionally, during his later years, B. shewed that his early love of the sublime was not wholly extinguished, by painting several altar-pieces, which exhibit a noble grandeur of execution, such as the 'Entombing of Christ,' in the church of St Maria, Padua; a 'Nativity,' now in the Louvre, Paris; 'St Roche interceding with the Virgin for a People infected with the Plague,' at Vicenza; 'The Wise Men's Offering,' and the 'Seizure of Christ in the Garden.' His rural pictures are abundant in the Italian galleries and in English collections. B. also painted heads of several of his contemporaries, Tasso, Ariosto, &c., and was in high favour with the Emperor Rudolph II., for whom he also executed several works. He died in 1592. He left four sons, who all followed their father's profession, but were not marked by any special originality of manner.

BASSE (*Labrax*), a genus of sea-fishes of the Perch (q. v.) family, distinguished from the true perches (*Perca*) by having the tongue covered with small teeth. The species are found on the shores both of Europe and America. The only British one is the Common B. (*L. lupus*), a fish which in its fins, scales, &c., much resembles a perch, but has a more elongated and salmon-like form. It is pretty abundant on some parts of the British coasts, and is not unfrequently taken by angling from the rocks, or by small seine-nets on sandy shores; often, also, by the hand line and by the long line. It is a strong, active fish, and was well known to the ancients; *labrax* is its Greek name; the Romans called it *lupus* (i. e., wolf), from its remarkable voracity. It is much esteemed for the table. It sometimes attains a large size, fifteen pounds or more in weight, but is generally much smaller. It not unfrequently ascends rivers to some distance, and the experiment of keeping it in a fresh-water pond has even been tried with success.—The Striped B., or Rock-fish of the United States (*L. lineatus*), very nearly resembles the common B., but attains a larger size, and is marked by seven or eight longitudinal black lines. The name Stone B. is given to the *Polyprion cernium*, a fish very rare on the coasts of Britain, but abundant in more southern parts of the Atlantic Ocean, as far as the Cape of Good Hope, and found on the

American coasts and in the Mediterranean. In general appearance, it resembles the common perch more nearly than the B., but differs from both in having only a single elongated dorsal fin. It sometimes follows ships of which the bottom is covered with barnacles, is easily taken, and is esteemed excellent for the table.

BASSE-CHANTANTE, in Music, the higher of the two basses in a score, partaking of more melody, and performed by the violoncello.

BASSE-CONTRAINTE, a French term in music, meaning a bass melody of a few bars repeated throughout the piece, while the other parts vary.

BASSEI'N, the name of two cities in India.—1. B., *in Pegu*, the capital of a district of the same name, stands on the left bank of an arm of the Irrawaddy, which joins the Bay of Bengal a few miles to the south of Cape Negrais. It lies in lat. 16° 45′ N., and long. 94° 50′ E.; and though it is 90 miles from the sea, yet it is easily and safely accessible to the largest ships. In a military view, also, the place is important, as it completely commands the navigation of the stream. It was captured by its present masters, the British, in 1852, the first year of the second Burmese war. Its estimated population is about 3000.—2. B., in the *presidency of Bombay*, is situated on an island of the same name; lat. of the island, 19° 20′—19° 28′ N., and long. 72° 48′—72° 54′ E. It appears to be the mere wreck of former grandeur, having been found by Bishop Heber, in 1825, with many churches and convents, to be altogether uninhabited and desolate. In 1534, it was ceded to the Portuguese; in 1765, after a possession of 231 years, it was wrested from them by the Mahrattas; in 1780, it surrendered to the British, after a regular siege of twelve days. The island, which contains about 35 square miles, is separated from the continent by a narrow channel, which, as a shelter for shipping, constituted its value in the eyes of the Portuguese. Historically, B. is of some interest, having been promised, though never delivered, as part of the dowry of Charles II.'s Portuguese consort.

BA'SSES, two ledges of rocks to the south-east of Ceylon, distinguished as *Great* and *Little*—the former group being more to the south-west, and the latter more to the north-east. They lie in N. lat. 6° 11′—6° 26′, and in E. long. 81° 40′—81° 59′. Their importance arises merely from their position, which is in a great thoroughfare of traffic.

BASSE-TERRE, a French term, equivalent to the English *Lowlands*, or, rather, *Lowland*, appropriately applied to several localities in the West Indies.—1. The capital of St Kitt's, on the west coast, in lat. 17° 17′ N., and long. 62° 42′ W. It is a low, hot, dusty place, standing at the outlet of a lovely valley of the same name. Its population is about 7000; and its trade, as the port of the island, is considerable. The designation of the valley and town is a memorial of the former occupation of the half of St Kitt's by the French.—2. The capital of Guadeloupe, giving its name to the larger of the two islets into which Guadeloupe is divided by an arm of the sea, known as Salt River. B. stands on the south-west coast, in lat. 16° N., and long. 61° 44′ W., having nothing worthy of the name of harbour, but merely a roadstead. It contains about 6000 inhabitants.—3. The chief town of Marie Galante, a dependency of Guadeloupe, which is about 12 miles to the north-west. It is otherwise ambitiously called Grand Bourg.

BA'SSET HORN (corno di bassetto), the richest and softest of all wind-instruments, invented in Passau, in 1770, improved by Lotz in Presburg, in 1782. It is similar to a clarionet in tone and fingering; its compass is two and a half octaves, the notes written for it being from

but the instrument sounds a fifth lower than the notes are written.

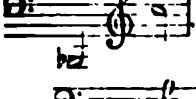
BA'SSIA, a genus of plants of the natural order *Sapotaceæ* (q. v.). The species are trees, tropical or sub-tropical, the flowers of which are remarkable for their fleshy corolla, and for the abundance of oil or butyraceous fat which the seeds contain, and which is used for many purposes by the inhabitants of the countries to which they are indigenous. The fruit has a pulpy rind, and 3 or 4 1-seeded cells. The ovary has 8 cells; but some of them are always abortive. The BUTTER-TREE, described by Mungo Park as growing in the interior of Africa, in the country of Bambarra, has been supposed to belong to this genus, and named *B. Parkii*. According to the eminent botanist Robert Brown, however, the seed of the butter-tree, as figured by Park, scarcely belongs to the genus B., but rather to the nearly allied genus *Vitellaria* or *Lucuma*. It produces the *Galam Butter*, also called *Shea Butter* (i. e., Tree Butter), which is highly valued, and forms an important article of internal commerce in the interior of Africa. The seeds of the fruit, which resembles an olive, are dried in the sun, or in a peculiar kind of oven, and the kernels are then boiled in water, in order to obtain the butter from them, which not only keeps for a whole year without salt, but is also whiter, more solid, and more pleasant to the taste than the butter of cows' milk. This butter is used both as an article of food and of medicine. It has been supposed that the introduction of this tree might be of great importance in other tropical countries.—The MADHUCA, MAHWA, or MAHOWA Tree of the East Indies (*B. latifolia*), is described as resembling a good oak in size, and is a valuable timber-tree. It is found in the mountainous parts of the Circars, Bahar, Bengal, &c. Its flowers are eaten raw, and a kind of arrack or spirit is distilled from them. The seeds yield, by expression, a considerable quantity of a concrete greenish-yellow oil, which is used for lamps, and occasionally for frying articles of food.—The Indian BUTTER-TREE, or PHULWARA or FULWA Tree (*B. butyracea*), is found in some of the more mountainous parts of India, and attains a height of 50 feet. Its timber is light and of no value. The leaves are 6—12 inches long. The fruit is of the size of a pigeon's egg, and although eaten, is not much esteemed; but from the seed, a concrete oil or butter is obtained, by expression, of a delicate white colour, much valued for medicinal uses, and as an unguent. It keeps for many months without becoming rancid.—The seeds of the ILLIPE-TREE, or Indian OIL-TREE (*B. longifolia*), a native of Coromandel, yield a large quantity of oil, which is used for lamps, for soap-making, and also by the poorer classes in cookery. The fleshy flowers are eaten, and are much esteemed; and the timber is very hard and durable, so much so, indeed, as to be compared in quality to teak.

BA'SSINET. See HELMET.

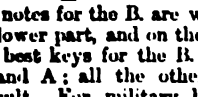
BASSOMPIERRE, FRANÇOIS DE, Marshal of France, was born in 1579 at Harnel, in Lorraine. Belonging to one of the oldest French families, he came, at the age of 20, to the French court, where he gained the favour of Henry IV. After the murder of Henry IV., he attached himself to the party of the queen, who appointed him colonel of the Swiss Guards; but on the murder of Concini, he sought to establish himself in the favour of the young king, and when the quarrel broke out between

mother and son, he particularly contributed to the overthrow of the former. He was raised to the rank of Marshal of France in 1622; was sent on embassies to Spain, Switzerland, and England; was actively employed in the siege of La Rochelle; took the pass of Susa by storm in 1629; and commanded for a little while the troops raised in Languedoc against the Huguenots. He became, however, an object of suspicion and dislike to Richelieu, who caused him to be cast into the Bastile in February 1631, from which he was not liberated until the death of Richelieu, in 1643, after he had been twelve years imprisoned. He died in 1646. He was an accomplished courtier, extravagant, and excessively addicted to gallantries. At the time of his arrest, he destroyed 6000 love-letters. His *Mémoires* (2 vols., Cologne, 1665; 4 vols., Amst. 1723), written in the Bastile, are rendered interesting by their spirited style.

BASSOON (Ital. *Fagotto*), a well-known wind-instrument of the reed species, made of maple-wood or plane-tree. The B. is an Italian invention; its name fagotto, meaning *a bundle*, probably from its being made in different pieces laid one against the other. The French call it *Basson de hautbois;* the Germans retain its Italian name. Its invention is attributed to Canonicus Afranio, in Ferrara, in 1539. In the middle of the 16th c., it had already reached great perfection. Sigmund Schnitzer, in Nürenberg, who died in 1578, was a celebrated maker. The B. consists of a bored-out tube of wood in several pieces, fixed together alongside each other, so as to bring the holes and keys within the reach of the fingers of each hand. The B. has, in general, not less than 8 holes and 10 keys. In the narrow end of the wooden tube is fixed a small tapering brass tube in the form of an S, on the end of which is placed the reed for producing the tone. The compass of the B. is from



but the best tones are those from



. The lowest C sharp, and B natural, are wanting. The notes for the B. are written on the bass clef for the lower part, and on the tenor clef for the higher. The best keys for the B. are E flat, B flat, F, C, G, D, and A; all the other keys are more or less difficult. For military bands there are different sizes of bassoons—one a fourth lower; another, the contra B., an octave lower; and a third, the tenor B., a fifth higher—all of the same construction. The best instruction books for the B. are by Almenräder, Fröhlich, Ozi, and by the Paris Conservatorium. B. is also the name of an organ-stop, the pipes of which are made to imitate the tones of the instrument.

BASSO'RA, BUSSORA, or **BASRAH,** a town of Asiatic Turkey, pashalic of Bagdad, is situated on the western bank of the Euphrates, here called the Shat-el-Arab, about midway between the mouth of the Tigris and the Persian Gulf, from which it is 70 miles distant. Lat. 30° 30′ N., long. 47° 34′ E. There are many gardens within the walls of the city, and many plantations of roses around it, but it is very dirty. The river, which is navigable up to B. for ships of 500 tons, is there divided into a number of channels, and by evaporation and frequent overflowing, makes the climate very unhealthy. The inhabitants, 60,000 in number, are for the most part poor Arabs and Persians; the officials and military alone are Turks. Commerce is in the hands of Armenians. Most of the houses are low huts, built of unburned bricks. An extensive trade is carried on in the exchange of the productions of Turkey and Persia with those of India, and also in European goods, particularly articles of British manufacture. Amongst the exports, are strong and beautiful horses. Caravans travel to Persia, and also by Bagdad and Aleppo to Constantinople. To guard against the incursions of the Arabs, a wall of about 94 miles in length has been erected in the neighbouring desert, at all the gates of which a watch is maintained. B. was founded in 636 by the Calif Omar, and soon became one of the most famous and opulent cities of the East. The possession of it has been the subject of many contests between the Turks and the Persians. It is a place of great note in the history of Arabic literature. A number of Arabian poets and scholars derive from it the surname of Basri.

BASSORA GUM, a whitish or yellowish-opaque substance resembling gum-arabic, but differing from it by being mostly insoluble in water. Its source has not been satisfactorily ascertained.

BASSO-RILIE'VO. See ALTO-RILIEVO.

BASS'S STRAIT separates Tasmania from Australia. It contains many islands, chiefly in its southern section, and is greatly beset by coral-reefs. It runs almost due east and west, has an average breadth of about 200 miles, and is pretty nearly bisected by the parallel of 40°.

B. S. deservedly bears the name of its explorer, who, without having been professionally a seaman, is entitled to a very high place among maritime discoverers. After having made shorter excursions from Port Jackson, in a mere wherry of 8 feet in length, Mr Surgeon Bass resolved to settle, in a whaling-boat, the question as to the connection or separation of New Holland and Tasmania. In his frail craft, he penetrated as far as Western Port, near the entrance of Port Phillip, where, from the trending of the land and the swell of the sea, he inferred that he had most probably reached the open ocean. He did not rest contented, however, until, in a tiny bark of 25 tons, he actually circumnavigated Tasmania. The discovery, so deliberately prosecuted, and so satisfactorily completed, soon proved to be fertile of results; for in 1802, only four years after the exploration of Bass, Port Phillip was entered; in 1804, Tasmania was colonised; and now the strait is the highway for a trade of more than a million sterling between Victoria and Tasmania—a trade which has very recently received an additional impetus from the laying of a telegraphic cable between the two colonies at their joint expense.

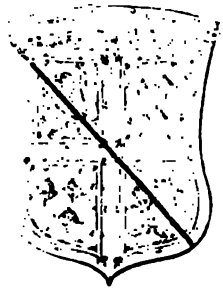
BAST, or **BASS,** also called *Inner Bark, Liber,* or *Endophlæum* (see BARK), the fibrous inferior layer of the bark in the stems of exogenous plants, which is particularly conspicuous in exogenous trees, as a peculiar substance interposed between the true bark and the wood. It consists in great part of sap-vessels (laticiferous vessels, see LATEX and SAP) lying close together, and assuming the appearance of tough fibres. In a fresh state, it has generally a whitish colour; and it is often composed of several layers, to which, however, the collective name of B.-layer is very often applied. The uses of this part of plants in the arts are very numerous; the fibres of hemp, flax, jute, &c., are nothing else than bast. The name B., however, is more commonly applied to the inner bark of trees, and is originally Russian, designating the inner bark of the lime-tree (q. v.) or linden-tree, which is employed for making a coarse kind of ropes, mats well known as B.-mats, and a kind of shoes much worn by the Russian peasantry. The trees are cut when full of sap in spring. For B. to be plaited into shoes, young stems of about

three years old are preferred; and it is said that two or three are required to make a single pair of shoes. Trees of six or eight years old are cut down for the better kind of mats, which are exported in large quantities from Russia, and particularly from the port of Archangel, and so much used for packing furniture, for covering tender plants in gardens, supplying strands with which plants are tied, &c. The trees from which the B. is taken are very generally burned for charcoal. After the bark is dried, its layers are easily separated by steeping in water. The finest layers are the inner, and the coarser are the outer ones.—The manufacture of B.-mats is nearly confined to Russia and Sweden. Not fewer than 3,500,000 are annually exported from Russia, and from 500,000 to 800,000 are annually imported into Britain. A few are made in Monmouthshire. Lime-tree B. is used in the south of Europe for making hats. The name B.-hat is, however, very often given to a hat made of willow-wood planed off in thin ribbons, and plaited in the same manner as straw-hats. The inner bark of *Grewia dilyma*, a tree of the same natural order with the lime-tree, is used for making ropes in the Himalaya Mountains.

BA'STARD BAR. In popular speech we frequently hear of a *Bar-sinister*, as a mark of bastardy. But a bar-sinister, strictly speaking, is an impossibility, inasmuch as the Bar (q.v.) is not formed of diagonal but of horizontal lines. A Bend-sinister (q.v.), which, by the French, is called a bar, has with more reason been confused with the true mark of illegitimacy, and has on that account been avoided even by heralds. But the real B. B. differs very essentially from the bend-sinister, being half of the scarp, which again is half of the bend-sinister.

Bastard Bar.

'The half of the scarp,' says Nisbet, 'with the English, is called a Batton-sinister; by the French, Baston-sinister; it is never carried in arms but as a mark of illegitimation, commonly called the Bastard-barr.' In modern practice, the baton does not touch the extremities of the shield, or of the quarter in which the paternal arms are placed, but is *couped*—that is, cut short at the ends. In this form the baton, when used as a mark of illegitimacy, is placed over the paternal coat of the bastard, whether used singly or in a quartered shield. Nisbet informs us that the baton-sinister, both in England and Scotland, is comparatively of modern invention, natural children in earlier times not having been permitted to assume the arms or even the names of their fathers. 'The unlawful children of John of Gaunt, Duke of Lancaster, begot on Katharine, daughter of Sir Payen Roat Guyn, King of Arms, did not carry the arms of their father the king, though nobilitate, with a baton-sinister, as now used; . . . but after the legitimation of these three natural sons by act of parliament, they then assumed the sovereign ensigns of England, within a bordure gobbonated (q.v.), argent and azure.'



Earl of Murray's Arms.

According to the practice of France, which probably was followed in England also, the bastard could not cancel or alter the baton without the consent of the chief of the family, or the authority of the sovereign. Even where the baton was not removed, it was common for the sovereign to grant his permission to carry it *dexter*, in place of sinister. Charles VII. of France allowed John, the Bastard of Orleans, for his valour against the English, to turn his baton traverse to the dexter, with which he and his successors afterwards *bruised* the arms of Orleans, as dukes of Longueville. The same privilege was granted to James, Earl of Murray, natural son of King James V. of Scotland, by his sister Queen Mary, and he thenceforth carried the Lion and tressure of Scotland thus bruised, quartered with the feudal arms of the earldom of Murray. The general practice of the milder heraldry of our own day is to substitute the gobbonated bordure for the B. B. not only in the case of the legitimate children of bastards, but of bastards themselves.

BASTARD EIGNÉ is the name given in English law-books to an eldest son illegitimate by birth, but whose father and mother were subsequently married, and had other children born in wedlock. See BASTARDS AND BASTARDY.

BA'STARDS AND BA'STARDY. Bastards, as described by Blackstone, are such children as are not born either in lawful wedlock, or within a competent time after its determination. The Scotch lawyers, again, true to their peculiar law of marriage, define a bastard as a child born of a woman who was not married to the father at the time of conception, *and who was never thereafter married to him*. It was at one time the law of England, when divorces *a mensa et thoro* were adjudged by the ecclesiastical courts, that if the wife had children during the legal separation occasioned by the form of divorce, such children were *primâ facie* [illegible] for the law presumed the parties to live [illegible] ably to the sentence of separation. But in modern times, the presumption has changed, and now favours legitimacy.

Bastards are incapable of inheriting real property; nor can they claim any share of personal estate as next of kin to a party dying intestate. They are said to be *filii nullius*, or *filii populi*, the sons of nobody, or the sons of the people, having no inheritable blood in them. As laid down, however, in many authorities, and among others in the last edition of Stephen's *Commentaries*, there is [illegible] tion to this rule in the case of a bastard [illegible] *mulier puisné*, and where, it may be observed, the principle of the Scotch law of legitimation to some extent to be admitted. Thus, where [illegible] has a bastard son, called a *bastard eigné* [illegible] afterwards marries the mother, and by her [illegible] legitimate son, who, in the language of [illegible] called a *mulier puisné*—if the father dies [illegible] *bastard eigné* enters upon his land, and enjoys [illegible] his death, and dies seised thereof, whereby [illegible] inheritance descends to his issue, the [illegible] and all other heirs are totally barred of their [illegible] because the laws of England pay such a [illegible] person in the situation of the *bastard* [illegible] after the land had descended to [illegible] would not unravel the matter [illegible] estate to be shaken. But this in[illegible] to no other kind of bastard; for [illegible] never married to the father, such bastard [illegible] no colourable title at all. And the above would almost appear to be the law of [illegible] the present day. But a recent statute [illegible] opinion somewhat doubtful, for by the 3 [illegible] IV. c. 27, s. 39, it is enacted that no *descent* [illegible] the 31st day of December 1833, shall [illegible] of entry or action for the recovery of [illegible] cast is meant an heir of a party [illegible] illegally to enjoy the land [illegible] his life, and was there [illegible] his heir, who thenceforth

not be impeached either by the original rightful owner, or by any of his descendants. The above statute, however, has cut off the rights in this behalf of all such descents cast, and the true owner can now, under the provisions of the act, always recover. But is the son of a *bastard eigné* such a 'descent cast' as is contemplated by the 3 and 4 Will. IV. c. 27? It may be doubted whether he is. The expression 'descent cast' is generally applied in law-books to the case of a *stranger* who, under a forcible, wrongful, and illegal entry on the land, had succeeded in diverting the inheritance from the direct and original channel. But such is not the position of a *bastard eigné*. He is not, in any sense of the word, a stranger; nor is the above privilege or favour allowed him and his family at all in respect of his position towards, or of anything that can be called his title to the *land*, but such privilege and favour are given him solely because of his *peculiar bastardy*. In fact, it is just because he is *not* a stranger, but his father's eldest son by birth, that the law from ancient times decided that he should not be altogether deprived of what otherwise would have been his natural rights. The rule, as we have suggested, appears to be founded on the principle of the Scotch law of subsequent legitimation; and the intention probably was to give effect to the good feeling of the second or other legitimate son, who, from a regard to his mother's character, as well as his brother's position, might find himself excused from asserting his claims. Whether the above statute can, by its general terms, be understood arbitrarily to alter such a reasonable and natural law of family succession, is a question for lawyers and law-courts. The point, however, is important for popular explanation. In all other cases, the law of England appears to be as distinct as it is severe. It has even been decided that a child born before wedlock in a foreign country, and according to whose law such child was legitimate, could not inherit land in England where his bastardy was indelible.

There can be no collateral succession through bastards; for as they cannot be heirs themselves, so neither can they have any heirs but those of their own bodies. A bastard is not entitled to the name either of his reputed father or of that of his mother, though he may acquire for himself a surname by reputation; nor can he take property by the mere description of *child* of his reputed parent, until he has acquired the reputation of standing in that relation to him. Nor does a bastard follow, as legitimate children do, his father's place of parochial settlement under the poor laws, but he has and follows the settlement of his mother until he attains the age of 16, or until he acquires a settlement in his own right, and after that age his primary settlement is in the parish where he was born. Another peculiarity of the status of bastardy is, that a bastard being *filius nullius*, the consent of his father or mother to his marriage is not required, and is of no avail; but a guardian may be appointed by the Court of Chancery for the purpose, or a licence may be granted upon oath made that there is no person authorised to give consent. To this may be added, that although in general a father may by deed or will appoint a guardian for his infant child, in the event of his decease, he has no such privilege if the child be illegitimate.

Such may be stated to be the principal peculiarities attaching to bastardy in the law of England. In other respects, a bastard is very much in the same position as a legitimate person. Thus, he can hold land in fee simple, and can dispose of it as he may think proper, making an unlimited alienation of it; and of course he can make a will bequeathing his whole estate; a simple and reasonable privilege, however, which, strange to say, was not conceded to bastards in Scotland dying without lawful issue, till the year 1836, when an act of parliament was passed, the 6 Will. IV. c. 22, which, on the preamble that 'it is just, humane, and expedient,' empowered bastards in that country to dispose of their personal property by testament or will in like manner as other persons might do, any law or practice to the contrary notwithstanding! In regard to his whole estate, although the crown is entitled to such in the case of a bastard dying intestate, the royal claim is not strictly enforced; but upon petition, the crown's right will be transferred to the nearest member of the deceased bastard's family. In the Scotch law, also, the crown may, by what is called a *gift of bastardy*, grant not only the personal, but the real estate of an intestate bastard to the 'donatory,' or person similarly entitled, as in the case of personal property in England. It is also to be observed, that the prohibitions as to marriage which extend to collaterals, and to those related by the half blood only, also apply although one of the parties be a bastard. Again, the laws relative to incest apply to a bastard with equal force as to others; the principle of the two latter points being that, although the bastard be *filius nullius* as to many civil consequences, his relationship to his natural parent is recognised for moral purposes. Of course, it need not be added that a bastard may be made legitimate by an act of parliament for all purposes, even for that of inheriting land, 'as was done,' says Blackstone, 'in the case of John of Gaunt's bastard children by a statute of Richard II.'

The paternity of a bastard or illegitimate child in England is ascertained by several statutes—7 and 8 Vict. c. 101, 35 and 36 Vict. c. 65, 36 and 37 Vict. c. 9; and the father is bound to make a proper allowance for the child's support till sixteen. But it is on the mother herself that the maintenance of the child in the first instance devolves. She is for this purpose entitled to its custody in preference to its father; and she is bound to maintain it as part of her family while she remains unmarried, or until the child attains the age of 16, or gains a settlement in its own right, or during a female is married; and in the event of the mother's marriage, the same liability attaches to her husband. If the mother be of sufficient ability to maintain the bastard, while he is so dependent on her, and neglect that duty, so that he becomes chargeable to a parish, she is liable, by 7 and 8 Vict. c. 101, s. 6, to be punished under the provisions of the *Vagrant Act* (q. v.). Whether the mother is of sufficient ability or not, she can, by affiliation proceedings, compel the father to pay a sum not exceeding five shillings a week till the child is sixteen (35 and 36 Vict. c. 65).

Besides the points in the Scotch law to which we have adverted, it is to be observed that in that system, the maintenance, or 'aliment,' as it is called, of illegitimate children, is a joint burden upon both parents. The mother is entitled to the custody of the child, but it does not appear whether she is to have such custody for any fixed time. It is in the discretion of the Court of Session to determine this, and it would seem that the period may vary according to circumstances, from seven to fourteen years. During this time, the father is bound to contribute his proportion of the expense; and if neither the father nor mother can support the child, it must be maintained by the parish in which the mother has a settlement.

There is a nice and curious difference in the laws of England and Scotland as to the mode of ascertaining the paternity of a bastard child. According to the statutes we have referred to, that fact may

be proved in England by the evidence of the mother, provided her statement is supported in 'some material particular' by other testimony. But in Scotland, the order of the inquiry is reversed; the woman's evidence in that country being taken *last*, and only where the other and independent evidence amounts to what is called a *semiplena probatio*—that is, such evidence as induces a reasonable belief, although not complete evidence, in which case she is admitted to give what is called her *oath in supplement*.

Both in England and Scotland, the widow of a bastard, whether there be issue or not of the marriage, is entitled to dower, terce, *jus relictæ*, and all the other legal rights of widows. See LEGITIMACY, SEPARATION, DIVORCE, MARRIAGE, DESCENT CAST, INHERITANCE, FEE-SIMPLE, SUCCESSION, PARISH SETTLEMENT, ULTIMA HÆRES, VAGRANT ACT, OATH IN SUPPLEMENT, and SEMIPLENA PROBATIO.

BA'STARDY, GIFT OF. See preceding article.

BA'STARDY, DECLARATOR OF. This is a suit which may be instituted in the Court of Session in Scotland, for having it declared that the lands or effects which belonged to the deceased bastard, belong to the donatory in virtue of the gift from the crown. The 'defender,' or person against whom the suit is formally brought, is the party who would have succeeded to the bastard, had he been legitimate. B. can also be judicially declared by a similar mode of proceeding at the suit of a party who has any other interest, or, indeed, any interest whatever, to have such illegitimacy determined.

By a recent act of parliament, the 21 and 22 Vict. c. 93, the same conclusion may be substantially obtained by the English proceeding, directed by the act in the Court for Divorce and Matrimonial Causes. The act in question, it is declared, may be cited for all purposes, as the 'Legitimacy Declaration Act, 1858.'

BASTI'A, the former capital of Corsica, is picturesquely situated on the slope of a mountain, rising from the sea in the form of an amphitheatre, in the north-eastern part of the island, in lat. 42° 42′ N., and long. 9° 27′ E. It has about 20,000 inhabitants. The streets are narrow and crooked. It has a harbour suitable for small vessels, defended by a mole, at the mouth of which is a rock resembling a lion couchant, and designated 'Il Leone.' There is a considerable trade in leather, skins, wine, oil, figs, and pulse; and many stilettos and daggers are manufactured here, which are principally exported to Italy. Until recently, the printing-presses of B. were actively employed in the production of Italian publications that would not have been permitted to appear in that country itself. B. was founded in 1380 by the Genoese Leonel Lomellino. During last century, it was oftener than once taken by the British. It was made, in 1791, the capital of the French department of Corsica, which rank was afterwards transferred to Ajaccio. It is the seat of the highest courts of the island.

BASTIAT, FRÉDÉRIC, an eminent political economist, was born at Bayonne on the 29th of June 1801. His father was a merchant, and educated his son with a view to the same profession. After completing his studies, B. entered the commercial house of one of his uncles, established at Bayonne, and employed his leisure hours in the study of political economy. Circumstances called him into Spain and Portugal in 1840, where he took advantage of the opportunity afforded him to study the customs and institutions of these two countries, which have still much to learn before they can be on a footing of equality with other nations in matters of finance and political economy. His first appearance as an author was in 1844, when he published, in the *Journal des Economistes*, an article 'On the Influence of French and English Tariffs on the Respective Futures of the two Peoples.' It contained in germ B.'s theory of political economy, who, from that moment, was a decided opponent of the system of protection. Subsequently, in the same journal, he combated the economic fallacies of Socialism and the rights of labour. During a visit to England, he made the acquaintance of Cobden, and on his return to France, he translated (1845) the speeches of the free-traders, which he published with an introductory preface, entitled *Cobden and the League, or the English Agitation in Favour of Free Trade*, in which he gathered up into one solid mass the inconveniences of the protective system. B. now went to reside in Paris, where he continued to propagate his views with considerable success; he became secretary of the societies, and chief editor of the journal, established to vindicate the principles of free trade. After the revolution of 1848, he was elected successively a member of the Constituent and Legislative assemblies. In 1850, he came forward as the antagonist of the Socialist writer, Prudhon. Suffering from pulmonary disease, he repaired to Italy for change of climate, but died at Rome on the 24th December 1850.

Besides the writings mentioned, B. published *Sophismes Economiques—Propriété et Loi, Justice et Fraternité—Protectionisme et Communisme, Harmonies Economiques*, and several other important tractates, all of which exhibit extensive knowledge of the subjects discussed, convincing logic, and a power of sprightly and biting satire. The *Harmonies Economiques* has been translated into English by P. J. Stirling (*Harmonies of Political Economy*, Murray, Lond. 1860). The soundness of the principles which the writings of B. uphold, notwithstanding the protectionist tendencies of the government, is now generally acknowledged in France.

BASTIDE, JULES, a French journalist and politician, Minister of Foreign Affairs in 1848, and member of the Constituent Assembly, was born at Paris in 1800. In 1821, he became one of the first members of the French Carbonari; and after the July revolution, he was conspicuous among the writers of the radical opposition. On the reconstitution of the National Guard, B. was elected commandant-in-chief of the legion of artillery, in which the republicans were grouped, and took part in two insurrectionary movements, for the second of which—the *émeute* at Paris, 5th June 1832—he was condemned to death, but escaped to London. Pardoned in 1834, he returned to Paris, and again devoted himself to politics in the columns of the *National*. B., however, being one of those Neo-catholic republicans who regarded the Church of Rome as the religious synonym of democracy, could not heartily sympathise with the tone of that newspaper on religious topics, and in 1847 he founded the *Revue Nationale*, in which he advocated his peculiar opinions. During the revolution of 1848, he was a supporter of General Cavaignac, and an opponent of Socialism. In 1858, he published *La République Française et l'Italie en* 1848; and in 1859, *Guerre de Religion en France*.

BA'STILLE was, in France, a general term for a strong fortress, defended by towers or bastions (q. v.), and in this sense it was used in England also after the Norman Conquest. The famous prison to which the name latterly was appropriated, was originally the castle of Paris, and was built by order of Charles V., between 1370 and 1383, by Hugo Aubriot, Prévôt or Provost of Paris, at the

Porte St Antoine, as a defence against the English. Afterwards, when it came to be used as a state-prison, it was provided, during the 16th and 17th centuries, with vast bulwarks and ditches. On each of its longer sides the B. had four towers, of five stories each, over which there ran a gallery, which was armed with cannon. It was partly in these towers, and partly in cellars under the level of the ground, that the prisons were situated. The unfortunate inmates of these abodes were so effectually removed from the world without as often to be entirely forgotten, and in some cases it was found impossible to discover either their origin or the cause of their incarceration. The B. was capable

The Bastille.

of containing 70 to 80 prisoners, a number frequently reached during the reigns of Louis XIV. and Louis XV. Though small compared to the number which an ordinary prison contains, these numbers were considerable, when we reflect that they rarely consisted of persons of the lower ranks, or such as were guilty of actual crimes, but of those who were sacrificed to political despotism, court intrigue, ecclesiastical tyranny, or had fallen victims to family quarrels – and were lodged here in virtue of *lettres de cachet* (q. v.) – noblemen, authors, savans, priests, and publishers. On the 14th of July 1789, the fortress was surrounded by an armed mob, which the reactionary policy of the court had driven into fury, and to the number of which every moment added. The garrison consisted of 82 invalids and 32 Swiss. The negotiations which were entered into with the governor led to no other result than the removal of the cannon pointed on the Faubourg St Antoine, which by no means contented the exasperated multitude. Some cut the chains of the first drawbridge, and a contest took place, in which one of the besieged and 150 of the people were killed, or severely wounded; but the arrival of a portion of the troops which had already joined the people with four field-pieces, turned the fortune of the conflict in favour of the besiegers. Delaunay, the governor – who had been prevented by one of his officers, when on the point of blowing the fortress into the air – permitted the second drawbridge to be lowered, and the people rushed in, killing Delaunay himself and several of his officers. The destruction of the B. commenced on the following day, amid the thunder of cannon, and the pealing of the Te Deum. This event, in itself apparently of no great moment, leading only to the release of three unknown prisoners – one of whom had been its tenant for thirty years – and four forgers, and in which it is said only the 654 persons whose names now appear on the column in the Place de la Bastille, took part, nevertheless finally broke the spirit of the court-party, and changed the current of events in France.

BASTINA'DO (from the Fr. *baston* or *bâton*, a cudgel), the name given by Europeans to the punishment in use over the whole East, which consists in blows with a stick, generally upon the soles of the feet, but sometimes upon the back.

BA'STION, in Fortification, is one of the principal defence-works in a fortified place. It is a kind of tower, very broad in relation to its height. The plain wall, called the *curtain*, which often surrounds a fortified town, is usually a polygon of many sides; and in that case, bastions occupy all, or nearly all, the salient angles. Bastions are mostly five-sided: the two outermost sides are the *faces*, meeting in an angle towards the enemy; the two on either side of these are the *flanks*, meeting two curtains or portions of wall; and the fifth side, open to the interior of the fortified place, is the *gorge*. Bastions may be regarded as projections, which enable the defenders to watch the approach of the enemy to the foot of the wall, and to frustrate them by a flanking fire. Taking the average range of modern ordnance and muskets as a basis, engineers decide on a distance of 300 to 400 yards between B. and B.; but if Armstrong or Napoleon guns, and Enfield or Minié rifles, should hereafter be employed in attacking and defending fortified places, these figures will probably need modification. The length of each face and flank of a B. is so regulated, that two bastions can defend each other and the intermediate portion of wall. This principle was partly acted upon in the middle ages; but some of the Italian military engineers of the 16th c. first constructed the B. proper. The main substance of a B. is an immense mound of earth, capable of supporting heavy guns, and of receiving the fire of the enemy; but it is faced and strengthened in many parts with brick and stone. The top is broad enough to allow room for the large guns, and for infantry and artillery soldiers. A *hollow* B. has the space within it kept down to the level of the town or natural ground; but a *solid* B., filled up to the top with firm materials, is considered to be the best defensive construction. Vauban, the great French engineer, devised the plan of having large *detached* bastions opposite the chief angles of the place, with a ditch behind each; a tower or small B. being placed at the real angle of the wall behind. This was intended to enable the besieged to hold out for some time, even after the great bastions were taken.

The relation which bastions bear to the general system of attack and defence, is noticed under FORTIFICATION and SIEGE; while various details on the subject will be found under BATTERY, CASEMATE, CURTAIN, DITCH, EMBRASURE, ESCARP, PARAPET, RAMPART, &c. In wood-cuts illustrating many of these articles, the relative position of the B. will be better shewn than by any diagram in this place.

BA'SYLE is the name given by chemists to a simple or compound substance which can unite with oxygen to produce a base (q. v.). Thus, all the metals are examples of simple basyles, and ammonium (NH_4), ethyle (C_4H_5), methyle (C_2H_3), &c., represent compound basyles. Another property which a B. possesses is, that it can unite with a salt radical (q. v.), like chlorine or cyanogen, to form salts. Thus, the B. sodium (Na) combines with chlorine to produce a salt—in fact, common salt (NaCl); and mercury (Hg) unites with cyanogen (Cy) to form the salt cyanide of mercury ($HgCy_2$).

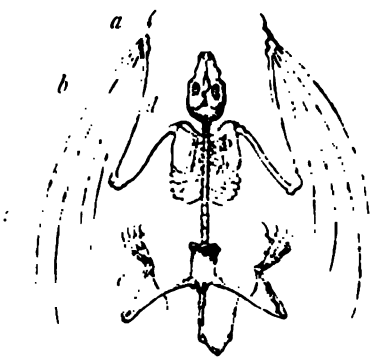
BAT, the common name of all animals of the class *Mammalia* which are furnished with true wings, and so are capable of really flying or propelling themselves in the air. They were all included by Linnæus in the genus *Vespertilio* (old Latin name), now subdivided and forming the family

Vespertilionidæ, which is very generally regarded as of precisely equal extent with the sub-order *Cheiroptera* (Gr. hand-winged), although some naturalists still follow Cuvier in regarding the *Galeopithecidæ* (Colugos or Flying Lemurs) as another

Long-eared Bat (*Plecotus auritus*).

family of Cheiroptera. But besides other characters which connect the Colugos with Lemurs rather than with bats, they greatly differ from bats in having a mere extension of the skin of the flanks attached to the limbs—as in the Flying Squirrels and Petaurists or Flying Phalangers, and in the Flying Dragon among saurian reptiles—capable of sustaining them in the air like a parachute in a very extended leap, but not of being expanded and closed by a succession of strokes for true flight. The power of true flight, bats, on the contrary, possess; and some of them not only fly rapidly, but wheel about very nimbly in the air, in pursuit of their insect prey.

It is very interesting to compare the organs of flight in bats with those of birds, both as to the points in which they agree, and those in which they differ. They beat the air, as birds do, with their anterior members; but the requisite extension of surface is not obtained by quills, but by a great elongation of the arms and fingers, upon which a thin membrane is stretched, folding close to the body by means of their joints, when the wing is not in use. A little attention to the accompanying figures of the skeleton of a bat and of a bat flying, will make plainer than mere words can the relation of the bones of a bat's wing to the bones of the human arm and hand, or to the ordinary bones of the anterior extremities in quadrupeds which have fingers or toes. The thumb, *a* (in figure of skeleton), is short, armed with a strong nail, and not at all included in the wing-membrane, nor used in flight.



Skeleton of Bat.

The bones most elongated of all are the metacarpal bones, or bones of the hand, *b*; the true finger-bones, *c*, are not so much so. The fore-arm, *d*, has not two bones (radius and ulna), but only one (the ulna with a sort of rudiment of the other; the rotator motion, of which these two bones afford the mean being not only unnecessary to bats, but at variance with the purpose chiefly designed in this part of their structure, of a powerful stroke in one particular direction. For a similar reason, 'the fingers of strange hand are incapable of closing towards palm, as ours do, when grasping an object. only movements are such as fold up the against the side of the body, by laying the close along the side of the fore-arm, as in fan.' Great strength, however, was requisite shoulder; and, accordingly, we find an ana birds in the size and solidity of the bones part, as well as in the thickness of the muscles which the wings are moved, and still more in th great dimensions of the sternum, or breast-bone, which they are attached. The sternum is als furnished with a medial ridge, as in birds, for th better attachment of the muscles. The ribs ar large; but the other bones generally, as those o the head and of the pelvis, are delicate. designed for lightness.—The wing- bats extends along the flanks to although these aid little in flight; but is to them so as to leave the feet free, which are like the feet of ordinary small quadrupeds with toes and claws, and are employed along with the thumb of the anterior limbs in creeping upon the ground in climbing perpendicular rough surfaces, or fa

Bat in repose.

hanging with the head downward in able posture of repose in which bats p of their lives, and in which they diffe other animals.

In the greater number of species of B membrane extends not only to the hind beyond them to the tail, which is include peculiar bone (*e* in fig. of skelet from each heel to afford further part of it, which seems to serve to the tail of birds, acting as a ru the animal to make those rapid e air, which it is so pleasing to see as in the summer evening. The fruit-eati tropical regions, which have no need such evolutions, are destitute of this part of the membrane; and accordi for which each species has been de are long or short, entirely included in or only for part of their length, or p little beyond it, and terminating in a that the tail is capable of bei creeping or climbing, evidently able power, and being

manner which suggests a slight analogy to the prehensile tails of monkeys.

Bats were placed by Linnæus in his order *Primates*, along with monkeys and lemurs, with which they agree in their pectoral teats and in other characters, particularly of the organs of reproduction. In one genus (*Dysopus*), there is an additional resemblance to the Primates in the partially opposable thumbs of the hind-feet, and a trace of this character is to be found in the fore-thumbs, already noticed. Bats are now, however, generally placed by naturalists in the order *Fera* or *Carnaria*, although, like many other animals of that great order, most of them are by no means exclusively carnivorous. The greater part of them feed chiefly on insects, some chiefly on fruits. They exhibit considerable variety both in the number and character of their teeth, as might be expected in animals which differ so much in their food. All of them have four rather large canine teeth; the incisors vary much in size and form, as well as in number. The digestive apparatus exhibits a variety corresponding with that of the teeth; the intestinal canal of the Vampyres (q. v.), which live by sucking the blood of animals, proceeding almost in a straight line from one extremity of the body to the other, whilst that of some of the

Head of Pteropus.

frugivorous bats, as the Kalong (q. v.) (*Pteropus*) of Java, is seven times as long as the body.

Except in the power of flight and things essential to it, bats present no resemblance to birds. The old English name *Flitter-mouse*, and the German *Fledermaus*, indicate an early popular recognition of their true place in creation. They are generally nocturnal animals, or, at least, prefer the twilight, although one of the British species may occasionally be seen pursuing insects during winter at mid-day. They generally spend the day in caves, hollow trees, and other dark recesses, often under roofs of houses, and in crannies of ruined or deserted buildings. They are found in almost all parts of the world, except the very coldest, but are most numerous and of greatest size within the tropics. Those of temperate climates generally spend the winter in a state of torpidity, in which, although circulation continues very languidly, respiration does not ordinarily take place. The whole number known to Linnæus amounted to a very few species, not half so many as are now known to inhabit Great Britain alone. Upwards of 130 species have been described, and there is great probability that the actual number existing is very much greater. It is not unlikely that some exaggerated accounts of the great bats of warm climates gave rise to the fable of the Harpies, which Virgil introduced into the *Æneid*. The bats of Europe are all small; the body of the largest British one is not so large as a mouse, and the fullest stretch of its wings about 15 inches, whilst the common British species are much smaller; but in the Kalong, already mentioned, the stretch of wing is 5 feet. Of British species, the largest is the Noctule B. (*Vespertilio noctula*), a very local species, found chiefly in the south of England; the Pipistrelle B. (*V. Pipistrellus*) is perhaps the most common. It was long confounded by British naturalists with the common B. of the continent of Europe (*V. murinus*), which is much larger, and very rare in Britain. In some parts of the country, the Long-eared B. (*Plecotus auritus*) is very common. It is distinguished by its enormously large and very beautiful ears, which, when it is asleep, are folded up in a remarkable manner under the arm, the long *tragus* then resembling a slender

a Great Bat or Noctule Bat (*Vespertilio noctula*).
b Greater Horse-shoe Bat (*Rhinolophus Ferrumequinum*).
Both British.

ear. This great development of the ears is characteristic of certain genera of B., that part of the ear called the *tragus* attaining also a remarkable size, so that it seems like a smaller ear in front of each large one. In many species, only two of which are found in Britain, there is a still more remarkable membranous or leaf-like appendage on the nose, which in some is simple, in some, complex, and often of large size, giving an extraordinary appearance to the face. Some of the larger species, having a nasal crest, are called Spectre Bats (q. v.). Only two species of B. (*Rhinolophus*), possessing such an appendage, are found in Britain, both of them very rare; from the form which it assumes, they are called Horse-shoe Bats. It is supposed that this nasal appendage is of use as a very delicate organ of touch, perhaps also of smell; as the great ears may be of use both for touch and hearing. These senses must often, in bats, when that of sight cannot be employed; and the sense of touch appears to be possessed in no ordinary degree even by the wing membrane. By supposing it to be affected by the pulsations of the air, Cuvier accounted for the power displayed by bats which had been cruelly deprived of sight, of avoiding objects amongst which they flew, without the necessity of ascribing to them, as Spallanzani had done, the possession of a sixth sense.

It deserves to be here noticed that, amongst the peculiarities which distinguish certain genera of bats, is the absence not only of the upper cutting teeth in the East Indian and African genus *Megaderma*, but even of the bone in which these teeth are usually placed; and that another tropical genus, *Nycteris*, of which the species are found in Africa and Java, have the skin attached to the body only at a few points, and capable of being blown up like a bladder, at the pleasure of the animal, by means of air which is inhaled through the nostrils into cheek-pouches communicating by small apertures with the general skin-bag. The use of this is wholly unknown.

Bats walk, or creep awkwardly upon the ground, one side of the body being jerked forward, and then the other, yet they run with considerable celerity. There is a common notion, that they cannot rise easily from a level surface, but must find some eminence from which to throw themselves. Of the fallacy of this, any one will soon be convinced

who gets a B. and places it upon the floor.—Bats commonly produce one or two young at a birth.—

Bat walking (*Plecotus auritus*).

Some of the species are very gregarious; others often fly about in pairs; great numbers, and of different species, are often found congregated in their places of hybernation or repose.—Some of the species are easily tamed, and become very familiar; but their odour is disagreeable, and it is generally found difficult to keep them long alive.

Fossil remains of *Cheiroptera* are occasionally found in eocene rocks, but owing to the delicacy of the bones, great difficulty has been experienced in the determination of the genera and species.

BAT, or BÂT (Fr.), in military matters, was originally the name of a kind of pack-saddle; and hence a bat-horse was a baggage-horse bearing a bat or pack, and a bat-man was a servant in charge of the horse and bat. By a modification of meaning, a bat-man is now any soldier allowed to act as servant to an officer. When British troops are sent on foreign service, bat-horses or mules are provided (if carriages are not forthcoming) for carrying the regimental books, the kettles and tents, the medicine-chest, the veterinary medicine-chest, intrenching tools, armourers' stores, saddlers' stores, &c.—about 20 such horses or mules to each battalion. Bat-horses and bat-men are also provided for carrying officers' camp-equipage. An allowance for procuring these accommodations is usually called Bat-money.

BATA'NGAS, a seaport town of the Philippines, island of Luzon, and capital of the province of the same name. Lat. 13° 45′ N., long. 121° 5′ E. Distance from Manilla, 50 miles S.; founded 1581. Pop. of town and district, 17,000. B., which is well built, and has an elegant appearance, is finely situated on an extensive bay which opens into the Strait of Mindoro. Considerable advantage is taken of its facilities for commerce.

BATARDEAU', a strong wall of masonry, built across the outer ditch of a fortress, to sustain the pressure of water when one part of the ditch is dry and the rest wet. It is built up to an angle at the top, and is armed with spikes, to prevent the enemy from crossing; and sometimes a stone tower is provided to strengthen the defence. There is a sluice-gate to regulate the admission of water.

BATA'TAS, or SWEET POTATO (*Convolvulus Batatas*, or *Batatas edulis*, the genus *Batatas* having recently been separated from *Convolvulus* [q. v.], chiefly upon account of the four-celled ovary), a perennial plant with long creeping stems, heart-shaped leaves on long stalks, and variously lobed, large purple flowers much resembling those of the best known species of Convolvulus, and very large oblong acuminated tubers. It is a native of the East Indies, but is now cultivated in all tropical and subtropical countries for its tubers, which are highly esteemed as an article of food, and are eaten either roasted or boiled; they are sweet, wholesome, and nutritious, but somewhat laxative. The B. forms, next to maize, the principal food of the poorer classes in some parts of America. Its cultivation is very easy; it is readily propagated by tubers [illegible] cuttings of the stem, requires little attenti[on] soon produces its tubers. In hot-houses [illegible] these are without difficulty obtained of l[arge] weight. The cultivation of the B. has been intro[duced] into the south of Europe. In America, it [is] little cultivated to the north of New Jersey, [and] even there is inferior. The leaves are used as [a] boiled vegetable. It is the B., or sweet potato which is usually meant by the older English writers when they mention potatoes. Its tubers were imported into England by way of Spain, and sold as a delicacy, before the potato was known.—*Batatas paniculata*, or *Convolvulus paniculatus*, a nearly allied

Batatas.

species, is cultivated in the same way as the B., and its tubers are similar in qua[lity]. —A new genus *Batatas*, has been referred to, formerly known as *Ipomœa macrorhiza*, now *jalapa*, so called from supposed purgative qualities of the root, which, however, it is found to possess, being white, insipid, saccharine, and farinaceous, and of great size, 50—60 lbs. in weight. The plant inhabits sandy soils in Georgia and [Florida].

BATA'VI (or, according to some MSS., Batavi), the name of a German people, who [originally] inhabited a part of the present Holland, namely, the island which was called after them Batavia, formed by the branch of the Rhine [which] runs into the sea at Leyden, the Waal, and the Meuse. Their country, however, extended [beyond] it, but its boundaries cannot now be determined. According to Tacitus, they were originally a branch of the Chatti, who [dwelt] on the Rhine. They were conquered by [Drusus], became subject to the Romans, and [behaved] so well, that they obtained the honorary title of friends and brothers of the Roman people; were exempted from taxes and assessments, but were required to provide a proportion of troops. They were permitted to choose their own [leaders] amongst themselves. Their cavalry [was particularly] good, and were often employed [in battle]. The first who terms the insular district of these Gauls, Batavia, is Ze[sar], who tells us that in the time of Con[stantine] it had fallen into the hands of [the Franks].

BATAVIA, properly the name of the island occupied by the ancient Batavi, became at a later date the Latin name for Holland and the whole kingdom of the Netherlands. The name BATAVIAN REPUBLIC was given to the Netherlands on their new organisation of 16th May 1795, and they continued to bear it till they were converted into the kingdom of Holland, under Louis Bonaparte, 5th June 1806.

BATAVIA, the capital of the empire of the Netherlands in the East Indies, stands on the north-west coast of Java, at the mouth of the Tjiliwong, frequently called the Jaccatra, from the former native town, on the ruins of which the present city was built. There is good anchorage for large ships in the offing, and it is navigable for smaller vessels towards the interior. The influence of a vertical sun on this Holland in miniature led it to become proverbial as the grave of Europeans. Latterly, however, the climate has been greatly improved by draining. The temperature, though not extreme, is oppressive from its uniformity, the mean of winter being 78·4° F., and that of summer only 78·6°. The latitude is 6° 7′ 40″ S., and the longitude 106° 52′ E. Pop. 55,000. Notwithstanding the growing prosperity of Singapore, B. continues to be the commercial emporium of the far East. Its markets present at once all the productions of Asia, and all the manufactures of Europe. In 1811, while Holland was a vassal of France, B. fell into the hands of the English, by whom it was restored to its former owners in 1816. Latterly, B. has found Singapore a formidable competitor for the trade between East and West. The Dutch government has recently laid a telegraphic cable along a line of 600 miles from B. to Singapore.

The province of Batavia is low, but rises gently towards the south. The forests have all been cut down for the use of the sugar factories. It is well adapted for fruit-trees and vegetables, which are cultivated by Chinese gardeners. Pop. 401,563, consisting of 4145 Europeans, 41,137 Chinese, 355,338 natives, and 943 foreign orientals. The peculiar character of the people has been lost by the influx of and intermarriage with strangers from all districts of the Indian archipelago. The language is a mixture of Sundanese, Malay, and other tongues, and is called low Malay. The largest estates are held by Europeans, the smaller by Chinese and natives. The religion is chiefly Mohammedan. There are good post roads. The industries continue to increase, and chiefly consist of factories for making machinery for distilling and for sugar works; distilling arrack, copper and tin work, dyeing, &c. The nutmeg, cacao, and cocoa nut tree are successfully grown.

BATAWA' PALM. See ENOCARPUS.

BATENBURG, a town of the Netherlands, in the province of Gelderland, situated on the right bank of the Maese, 9 miles west of Nymegen. It is worthy of notice only on account of its association with the Romans, whose *Oppidum Batavorum* it was.

BATH, the chief city in Somersetshire, England, is beautifully situated in a wooded valley in the north east part of the county, on the Avon, 20 miles from its mouth, and 106 miles west of London. The houses are built wholly of white freestone 'Bath oolite,' worked in the neighbouring quarries, bricks being entirely discarded. The city has a finer appearance than any other in England, the variety of level giving very commanding sites for its fine and regular streets, crescents, and public buildings. The beauty and sheltered character of its situation, the mildness of its climate, and especially the curative efficacy of its hot chalybeate springs, have long rendered B. a favourite fashionable resort. The springs, which are four in number, were known to the Romans, who built baths on the spot in the 1st c., of which extensive remains were discovered in 1775. The temperature of the springs varies from 97° to 117° F.; they rise near the river bank, in the centre of the city, and discharge 184,320 gallons of water daily. The water is most useful in bilious, nervous, and scrofulous complaints, palsy, rheumatism, gout, and cutaneous diseases. Though the gaiety of B. has greatly waned since the days of the Prince Regent, there has been a great general improvement in the city, but the population somewhat diminished during the twenty years 1851—1871. It has two parks, and many public walks and open places; theatre, concert-rooms, and other places of amusement; subscription library, museum, club-house, educational institutions, &c. The Abbey Church is a cruciform structure in the latest perpendicular style, with a fine roof in the style of Henry VII.'s chapel, and a central tower 150 feet high. About a mile to the north-west is Beckford's Tower, built by the eccentric author of *Vathek*, but now a cemetery chapel. It is 154 feet high. B. returns two members to parliament. Pop. (1871) 53,704, at times much increased by visitors. B. has no manufactures of any note. Coal is found in the neighbourhood. The Great Western Railway from London to the west passes through the city. B. is of great antiquity; it was a Roman station called *Aquæ Solis*, at the intersection of the great Roman ways from London to Wales, and from Lincoln to the south coast of England. Richard I. granted B. its earliest extant charter, which was subsequently confirmed by Henry III., and greatly extended by George III. A greater number of Roman remains have been found in and near B. than elsewhere in Britain; they form a collection unrivalled in extent and value.

BATH, KNIGHTS OF THE. The name of this order is derived from the ceremony of bathing, which used to be practised at the inauguration of a knight, as an emblem of the purity henceforth required of him by the laws of chivalry. The

Collar and Badge of the Bath.

ceremony is of unknown antiquity, and is spoken of by writers of the 13th c. as an ancient custom. See KNIGHT. The earliest authentic instance of its observance which we have in this country, is in the time of Henry IV., who, in preparing for his coronation, made forty-six knights at the Tower of London, who had watched all the night before, and

bathed themselves. The last knights of the B. created in the ancient form were at the coronation of Charles II. in 1661. From that period till the accession of the House of Hanover, the order fell into oblivion. It was revived by George I. in 1725, and is now the second order in rank in England, the first being the Garter. By the statutes then framed for the government of the order, it was declared that, besides the sovereign, a prince of

Star of the Bath.

the blood, and a great master, there should be thirty-five knights. At the conclusion of the great war, it was thought expedient, with a view to rewarding the merits of many distinguished officers, both military and naval, to extend the limits of the order, which was effected on the 2d January 1815. But the order was still purely military, and it was not till 1847 that it was placed on its present footing by the admission of civil knights, commanders, and companions. The following is its present organisation.

First Class.—Knights Grand Cross (K.G.C.); the number not to exceed, for the military service, 50, exclusive of the royal family and foreigners; and for the civil service, 25.

Second Class.—Knights Commanders (K.C.B.); military, 102, and civil, 50, exclusive of foreigners. These, like the first, have the title *Sir*, and take precedence of Knights Bachelors.

Third Class.—Companions (C.B.); military, 525, and civil, 200. They take precedence of Esquires, but are not entitled to the distinctive appellation of knighthood. No officer can be nominated to the military division of this class unless his name has been mentioned in the *London Gazette* for distinguished services in action; and the order has never been conferred on an officer below the rank of a major, or commander in the navy.

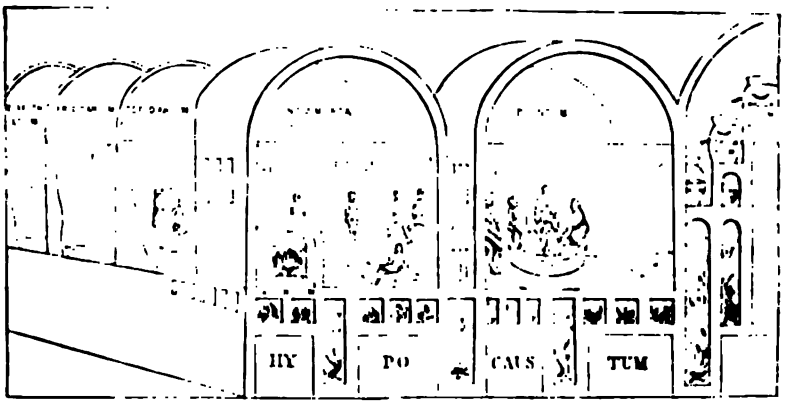
BATH, BATHING. By bathing is usually understood the immersion of the body, or a part of it, in water. In a more extended signification, it means the surrounding of the body with any medium differing in nature or temperature from its usual medium; thus, we speak of a blood-bath, a vapour-bath, a cold-air bath, a compressed-air bath (q.v.), an earth-bath. A fourfold division may be made of baths: 1. According to the substance with which the body is surrounded into water, oil, milk, gas, sand, and other baths; 2. According to the manner of application into river, slipper, plunge, shower, dropping, vapour, and douche baths; 3. According to the parts of the body subjected to the application into whole, half, sitz, foot, hand, and eye baths; and 4. According to the temperature of the substance applied – into cold, tepid, warm, and hot baths.

The practice of bathing undoubtedly reaches back to the earliest times in the existence of the human race, and the most ancient historical accounts as well as popular myths make mention of it. Among the Egyptians, the bath was practised as a religious rite; and, in general, we find the opinion prevailing throughout antiquity, that purification of the body induced or signified moral purity. Man, it was thought, ought to present himself pure in body and soul, when he engaged in the service of his god, or in any transaction that brought him into immediate contact with that being. In making the bath a religious ordinance, Moses may have had in view the prevention or more speedy cure of those skin-diseases so prevalent in the East. The Mosaic Law prescribes expressly, in some cases, the use of running water, which has given rise, through misunderstanding, to the deleterious cellar-baths of the Jews. In Palestine, the wealthier Jews had private baths in their houses, and ponds in their gardens, an arrangement which prevailed in all the civilised parts of the East, and which does so still. There were, besides, public bath-houses among the Jews, as among other nations. Among the Greeks, also, bathing was very early in use. The practice is often alluded to in Homer. Bathing, among the Greeks, as among other nations, was counted a religious rite, and was connected with the preparations for sacrifice, for the reception of oracles, for marriage, &c. We possess, however, no detailed accounts of the construction and arrangements of private or of public baths in Greece, which were mostly connected with the gymnasia. That men bathed together; that there were public baths for women, appears probable from various inscriptions.

Among the Romans, although warm-baths (*thermæ*) were in use from the earliest times, yet it was only at a late period that they were so extensively adopted; and then the increase and universal spread of luxury had driven the primitive object of bathing into the background, so that the public baths were looked upon as places of general resort for pleasure. The most of these public baths were built under the emperors. They were numerous in Rome and in the provincial cities. Their construction may be gathered from their numerous remains, and from the descriptions of them given by Roman writers; they resembled the Turkish and Russian baths.

The essential parts of a Roman bath were as follows.—1. The *hypocaust*, or stove, in the basement story, for heating both the bath-rooms and the water. The water was contained in three large vessels or boilers, so arranged that the under one was immediately over the fire, contained the hot water; the one in the middle, the tepid water; and the uppermost, the cold water. These vessels were all connected by pipes, both with the bath-rooms and with one another, that the hot water that flowed from the lowest boiler was replaced by tepid water from the one above; and that, again, by cold from the uppermost.—2. The *apodyterium*, or room for undressing.—3. The *frigidarium*, a room with a basin for cold bathing.—4. The *tepidarium*, the purpose of which cannot be exactly determined, but which seems to have been intended for bathing in tepid water, and also for allowing the body to cool down in a mild temperature.—5. The *sudatorium*, in which sometimes the *sudatio*, or sweating-bath, and sometimes the real hot-water bath was taken. This room had hollow walls, and rested on low pillars over the hypocaust, and was surrounded on all sides with [illegible]. The *laconium*, which is spoken of as a kind of caldarium, was probably a kind of stove heated from the hypocaust, and con-

e the temperature. In the bath-rooms there e basins (*alvei*) for holding the water, and round walls were benches or seats, which, in the larium, were raised as in an amphitheatre, in r to give the bathers the choice of the higher temperature of the upper part of the room, or of the more moderate of the lower. The caldarium contained also a *labrum* or vase of several feet diameter, filled with cold water, into which the bathers dipped after the hot bath. With these essential parts of



Roman Bath, from a Painting on the Walls of the Thermæ of Titus at Rome.

ith, there were usually connected an *unctuarium* *rothesium* i. e., an anointing-room, and often lens, covered walks, rooms for games, &c.

he process of bathing was thus: After undressin the apodyterium, the bather was anointed in elaothesium with a cheap coarse oil, and then ssed to a spacious apartment devoted to rcises of various kinds, among which games at held a prominent place (hence the hall was ed *sphæristerium*). After exercise, he went into caldarium, either merely to sweat or to take the bath; and during this part of the process, the y was scraped with instruments called *strigiles*. ng now dried with cloths, and slightly anointed over with perfumed oils, he resumed his dress, then passed a short time successively in the darium and the tepidarium, which softened the ition from the great heat of the caldarium into open air.

he public baths for women were of similar struction, and were much frequented even by the t respectable. The women bathed in company, the men. The irregularity of men and women hing together is also alluded to by ancient ters; and in later times, the baths in general ame the scenes of all sorts of debauchery, as was ecase at Baiæ.

he most remarkable remains of Roman baths are se of the baths of Titus, of Caracalla, and of cletian in Rome, and the recently excavated ains at Pompeii: remains of the kind are also be found in Germany, France, and England. extent and magnificence of these edifices it is icult for us now to conceive. Speaking of the hs of Caracalla, Mr Fergusson, in his *Hand-book Architecture*, says: 'St George's Hall, at Liverpool, he most exact copy, in modern times, of a part these baths. The hall itself is a reproduction, h in scale and design, of the central hall of acalla's baths, but improved in detail and design, ing five bays instead of only three. With the courts at each end, it makes up a suite of rtments very similar to those found in the an examples. The whole building, however, is than one fourth of the size of the central mass Roman bath, and therefore gives but little idea he magnificence of the whole.'

The ancient Germans seem, according to Tacitus and other writers, to have been fondest of the cold river bath. When Roman luxury was driven out by German habits, and the north of Europe got the upper hand of the south, baths ceased to be of public importance, and amid the tempestuous irruptions and fluctuations of the different nations, those splendid edifices fell into ruins. Christianity, however, by the institution of baptism, had preserved for the bath its religious signification; and in the middle ages, among the ceremonies preceding the solemnity of conferring the honour of knighthood, the bath was held essential. The Arabians and the Mohammedans generally had more completely adopted bathing into their manners and customs. Islam enjoins on the believer the careful preservation of corporal purity; and for this purpose, prescribes repeated daily ablutions. Besides these, certain circumstances and times make the use of the Bath ritually obligatory on both men and women. For this end, not only did the rich erect splendid baths in their houses and gardens, but bath-houses for the people in general were established in every town in which there was a mosque. The public baths of the Turks of the present day are a copy of those ancient Arabian baths. The construction of those oriental baths, imitations of which are now to be found in some European cities, is as follows: The building is of stone, the bath-rooms have a floor of marble, which is heated from below, and tubes in the walls conduct the heat in all directions. The bather undresses, wraps himself in a blanket, puts on wooden slippers, to protect him from the heat of the floor, and enters the bath-room. Here a general perspiration soon breaks through the skin, which is washed off with cold water. The body is then rubbed with woollen cloths, and smeared with a soap or salve beneficial to the skin. This is generally accompanied by the operation of 'kneading.' The bath attendant stretches the bather on a table, pours warm water over him, and then begins to press, squeeze, and twist his whole body with wonderful dexterity. Every limb is straightened and stretched, and when he has finished one side, he begins on the other. He kneels upon the bather; he seizes him by the shoulders, makes his backbone crack, and every vertebra quiver, or applies soft

blows to the fleshy parts. He then takes a hair-cloth, and rubs the whole body, rubs off the hard skin of the feet with pumice-stone, anoints the bather with soap and perfumes, and finishes by cutting his hair and beard. This treatment lasts some three-quarters of an hour; and the feeling after it is as of being born anew. An inexpressibly delicious sensation of comfort pervades the body, and soon ends in a sweet sleep. After bathing, people repose in a cooler room, stretched on couches, and finally partake of coffee, sherbet, or lemonade.

In England, France, and Germany, public establishments for bathing were long unknown. It was during the Crusades, which brought the East and West into contact, that Europeans first became acquainted with the baths of the Asiatics; and the want of such institutions came to be more sensibly felt from the leprosy and other skin-diseases which intercourse with Asia introduced into Western Europe. The evil was at first sought to be met by establishing hospitals; but as these were found insufficient, baths and bath-rooms were erected, which gradually became public establishments.

Besides the kinds of baths already described, there are now to be found in the larger cities of Europe, generally in connection with water-baths, imitations of the vapour-baths which have been long in common use in Russia. The RUSSIAN BATH consists of a small apartment built of wood, with broad benches running round it, on which the people lie undressed. By throwing water upon glowing hot pebbles, a dense hot steam is produced, which envelops the bathers, and throws them into such a heat, that the perspiration breaks out over the whole body. In this atmosphere of steam, the thermometer often rises to 112°—140° F. After they have sweated for some time, and from time to time cooled themselves again, by having cold water poured over them, the skin is rubbed with soap, and with towels made of inner bark, or with brushes; they are flogged with softened birch-twigs, and then washed with tepid, and afterwards with cold water; and at last have cold water dashed over them. A bather will also go direct from the sweating-bath, and plunge into a river or a pond, or roll himself in the snow. These baths are a necessary of life in Russia, and are to be found in every village. The German vapour-bath differs in this, that the steam is produced in a boiler, and that the bather remains for some time in an adjoining room of moderate temperature, wrapped in blankets, to allow the perspiration to go on, and the blood to become calm. A ruder kind of sweating-bath, in a hole in the earth, or in a baking-oven, is practised among many nations; among the Finns, the natives of Mexico and South America, &c.

As regards detergence, the vapour-bath is the only kind of bath that is really effectual. Seated naked in a room filled with hot vapour (which produces no inconvenience in breathing), the scurf, which, notwithstanding all sorts of previous ablutions, has accumulated on the skin, is gradually softened and loosened, and is rubbed off in a surprising manner by the hands of the bath-man who is in attendance at these establishments. As in the Turkish bath, the person is cooled down by being dashed with tepid and cold water. After this kind of bathing, the sensation is exceedingly agreeable. The process just mentioned may be said to resemble that in use by the Romans; the hands of the operator having much the same effect as the *strigils* of the ancients. Few of the ordinary bathing establishments in Great Britain have vapour-baths, at least not on a proper footing; and the great value of this species of bath as a purifier of the skin is little known.

Bathing is a very important agent in the preservation and restoration of health. Besides promoting cleanliness, the refreshing and invigorating effects of cold bathing in its various forms have always been more or less understood, as have also the soothing effects of the warm bath. But the virtues of water as a curative agent have been more fully developed in modern times, since the rise of the system of therapeutics known as the water-cure or hydropathy. With that exaggeration which is incident to everything new, the first promoters of this system gave it out as a panacea 'for all the ills that flesh is heir to.' But now that these quackish pretensions are all but universally given up, it is very generally admitted that water is capable of a large range of effects, some of them apparently of the most opposite kinds; while the mode of action is nothing mysterious, but capable of explanation on the recognised principles of physiology. The fuller exposition of this part of the subject will be more conveniently considered under HYDROPATHY.

A MEDICATED BATH is one in which some substance, intended to act as a medicine, has been mixed with the liquid. This is one of the most important methods known to medical art of bringing remedies to bear upon the system. The skin is by no means impervious to foreign substances; and no other organ presents at once so large a surface to the matter to be imbibed; at times, also, the other channels by which remedies are introduced into the body cannot be used. Baths of this kind are partly imitations of natural mineral waters, and partly other remedial mixtures. The mineral substances used are common salt, chloride of lime, nitric acid, corrosive sublimate, potash or soda caustic or carbonated, ashes, soap, iodine, sulphur, iron, &c.; the vegetable are wine, vinegar, solutions of essential oils, infusions of thyme, rosemary, lavender, wormwood, willow, oak, and Peruvian bark, &c.; such animal substances as milk, blood, bouillon of meat, &c., are also sometimes employed as baths, with a view to impart nourishment, but whether much is taken up into the system, is doubtful. In the case, also, of vapour-baths, medicaments are added to the water with good effect; these must, of course, be volatile. If the whole body is to be immersed in the vapour, nothing must be used that might injure the organs of respiration; when the application is partial, and by a special apparatus, this precaution is less necessary. In connection with this may be mentioned the so-called SMOKE-BATHS, or medicated fumigations, in which the whole body, with exception, of course, of the head, or particular parts of it, are brought in contact with the vapours of dry medicinal substances. Resinous aromatic substances, incense, myrrh, benzoin, amber, sulphur, cinnabar, and mercury are used for this purpose. The application must be made in what is called a fumigating box, in which the particular part of the body alone is enclosed along with the vapour, in order that the respiratory organs may not be incommoded. The utmost precaution is requisite with the vapours of sulphur and mercury, as they are apt to occasion serious accidents.

Another species of vapour-bath is what is called an ANIMAL BATH, which was known to the ancients, and was in great reputation in cases of lameness. Either the whole body of the patient is wrapped in the skin of a newly slaughtered animal, or an opening is made, and the diseased limb inserted into the breast or belly of the animal while yet alive, or into the newly drawn blood. Sometimes smaller animals are killed, split up, and immediately applied to the diseased part.

Of GAS BATHS, the most generally used are those

of sulphuretted hydrogen and carbonic acid gas, which are to be had at certain mineral springs. The first, mixed in small quantity with atmospheric air, lowers the irritability of the air-tubes, and affords relief in many diseases of the respiratory organs. A stronger mixture of it, brought in contact with the outer surface, is of use in disorders arising from depression of the functions of the skin. Carbonic acid gas gives a gentle stimulus to the skin, promotes menstruation, and is much used in many places in the form of half-baths. In recent times, at Ischl and other places, the vapours that arise from the mineral springs loaded with saline particles, are received in close rooms, in which the patients walk about, and allow the vapours to act upon the lungs and skin.

The terms *water-bath* and *sand-bath* have been adopted in chemistry, to signify a contrivance by which vessels that are to be heated to a certain temperature are not brought into immediate contact with the fire, but receive their heat through the medium of hot sand or water, so that the heating takes place uniformly, and overheating is avoided.

BATHS AND WASH-HOUSES, PUBLIC. The last few years have witnessed the erection of a number of public establishments, at which the masses may enjoy a bath for the merest trifle of their weekly earnings. Where steam-engines are employed in connection with cotton-factories or other works, there is usually a certain quantity of waste steam or waste hot water at disposal, which could, at an insignificant cost, be directed into baths for the use of the workmen of the establishment. We are aware of one instance where seven baths were comfortably fitted up at the small expense of £80, in which the men and women bathe on alternate days, to the number of from thirty to eighty a week—paying a mere trifle to the keeper, who attends an hour and a half each evening, and finds towels, soap, &c., nothing being charged by the proprietors for the original outlay. But this is only a small part of the cure for a great evil. Where the masses are densely packed in lanes and alleys, where house accommodation is dear and limited, where the necessaries of life have to be continually struggled for, and these conventional evils increased, in too many instances, by improvidence—the house is but a night shelter, affording little or no convenience for the necessary operations of the housewife. Independent of this, a public wash-house is, in point of economy, preferable to any number of isolated efforts. By co-operation, superior accommodation, better apparatus, and a cheaper and more satisfactory result can be obtained; and thus the public wash house, where self paying and self supported, may be classed among the co-operative arrangements which characterise the social features of the age.

Mrs Catherine Wilkinson of Liverpool, in a year of cholera, bravely offered the use of her small house, and the value of her personal superintendence, to her poorer neighbours, to facilitate the washing of their clothes at a time when cleanliness was more than usually important. The success attending the exertions of a single individual led to the formation of a benevolent society, and ultimately to important municipal arrangements.

In 1844, a public meeting was held at the Mansion House, attended by many persons of wealth and influence, to encourage the formation of B. and W. in London; hence resulted an 'Association for Promoting Cleanliness amongst the Poor.' Independently of this movement, a reform had already been commenced by a 'Committee for the Houseless Poor,' who, among other things, purchased or rented an old roomy building in Glasshouse Yard, surrounded by the poor and dense population of the London Docks district. A bath-house and a wash-house were fitted up; baths, cisterns, boilers, cold and hot water, towels, soap, soda, were provided; and the poor were invited to come in, and wash and bathe without expense to themselves. There were also provided pails, brushes, and whitewash, to those who would take the trouble to give a little cleanliness to their poor dwellings. This was effected mainly through the benevolent exertions of Mr Bowie, a surgeon, who applied himself with earnestness to the subject. The association, afterwards founded at the city meeting, sought two objects—to induce a wish for cleanliness among the poor; and to render public B. and W. *self-paying*, as a guarantee for their permanency. Having obtained plans and estimates from architects, the association built a model establishment in Goulston Square, Whitechapel; but the outlay unfortunately reached £26,000. In the meantime, another society had succeeded in establishing B. and W. in George Street, Hampstead Road, favoured by a liberal arrangement on the part of the New River Company in the supply of water: this establishment was opened in August 1846. In the same year, parliament passed an act to enable borough councils and parish vestries to establish public B. and W., supported by borough and parish rates, if the householders should sanction such a proceeding. In 1847, another act strengthened the former; and the two together contain the necessary clauses for defining the details of the plan (see the following article). The parish of St Martin's-in-the-Fields was the first to take advantage of the new act; and before the close of 1852, six parishes had erected public B. and W. At the beginning of 1856, the list had nearly doubled. The original free but humble building in Glasshouse Yard had been abandoned; but the model establishment in Goulston Square, and the separate undertaking in Hampstead Road, remained. There are, in 1873, about sixteen of these public and parochial B. and W. in the metropolis.

It is not to be supposed that these efforts have been confined to London. Liverpool took precedence in date, and has since worthily maintained her interest in the matter. Manchester, Oldham, Hull, Bristol, Birmingham, Preston, Bath, Wolverhampton, Coventry, Plymouth, Chester, Sunderland, Bolton, Macclesfield, Oxford, Maidstone, Exeter, Rotherham, Colchester, South Shields, Dublin, Belfast, Glasgow, Dundee, Aberdeen, and other towns, have since adopted a similar course; and it may safely be predicted that borough and parochial B. and W. will increase in number year by year; for if they do not actually pay their full expenses at the low tariff charge, the deficiency will be so small as to be practically unfelt by rate-payers.

When the legislature took up the subject, the purpose of the committee appointed in 1844 was in great part answered; but that committee continued to exist until 1855; and the exertions of its members were attended with very beneficial results, in drawing the attention of influential persons in various countries to the advantages of public B. and W. The French government voted 600,000 francs to assist the promotion of such institutions in France, after the plan of the model establishment; and a scheme was set on foot for erecting fourteen establishments in Paris, for which 2,000,000 francs would be required. The municipality of Venice marked out an expenditure of £33,000 in the erection of B. on the same plan. The Norwegian government applied to the committee for the plans, &c., of their wash-house at Goulston Square, as a guide for the erection of one at Christiania; and a subscription was made for the erection of B. and W.

at Copenhagen. The Belgian government, and the authorities at Hamburg, Turin, Munich, Amsterdam, Lisbon, New York, and other places, were in like manner furnished with information on the subject.

In nearly all the London establishments, which may also be taken as types of those in the country, the characteristic features are as follows: The B. for males and females are on opposite sides of the building. The separate B., in large well-lighted and well-ventilated rooms, are shut in by walls, generally of slate; and the B. themselves, supplied with fifty or sixty gallons of water for each bather, are either of zinc or enamelled iron. There are two, three, or four classes of B., charged differently according to the amount of accommodation afforded. At the St Martin's establishment, where there are only two classes of B., it has been found that the second-class bathers are thrice as numerous as the first. Arrangements, slightly varying in different establishments, afford means for conveying hot and cold water to every bath. In some instances, there are tepid as well as cold swimming or plunging B.; while two or three of them afford facilities for shower and vapour baths. The washing-rooms, in most of these establishments, are provided with numerous small compartments, doorless and roofless, each for one person. Each compartment contains a boiler and a washing-tub, with taps for hot water, cold water, waste water, and steam: all unlimited in quantity, wilful waste of course being guarded against. An American washing-board assists the operations; and a rack-work stand protects the feet. The steam from all the compartments is carried upwards to one great ventilating shaft. The 'wringing' of the wet washed linen is effected by putting the articles into a sort of perforated cylinder, which is then rotated with great velocity; the centrifugal force drives out the water through the perforations and interstices, leaving the linen, though damp, much drier than it can be made by the familiar laundry process. The clothes are then taken to the drying-room, where they are hung on frames or 'horses' in small chambers heated with hot air to about 200° or 210°. 10,000 articles of washed clothing can now be dried with about £1 worth of fuel, or much less in the towns of the north. In some of the improved establishments, there is a drying compartment belonging to each washing compartment, effecting a manifest saving of time to the washers; in some of them, too, there is an ironing-board to each compartment; but the general plan is to have a large ironing-room, well provided with irons, ironing-blankets and boards, and heating arrangements. The charge is from 1*d.* to 2½*d.* per hour, according to the class and the accommodation.

One particular establishment at Manchester may usefully be described more in detail, as a type of the general class of B. and W. There is a men's swimming-bath, 70 feet by 25, with a pavement of polished York stone on a foundation of concrete and cement; the sides are of porcelain tiles laid in cement. There are 32 enclosed dressing-closets. Over these, on iron pillars, are 17 men's warm baths, each 8 feet by 7. Separated from this gallery by an open passage are 5 extra first-class baths, larger in size, and having shower-baths. There is a second-class swimming-bath nearly like that for the first-class; with its gallery of small baths over. The women's baths, in a different part of the building, comprise 4 first and 7 second class. The laundry is at one end of the building. The washing-room is 64 feet by 38; it comprises 6 first-class and 30 second-class compartments, each of the former provided with three tubs, and each of the latter with two. There is provision for drying any amount of c in twenty minutes after the washing and wr are completed. All the women have access t patent wringing-machines. There is an room adjoining, fitted up with stoves. The wat tank has a capacity of 3000 gallons; the baths all full, would hold 50,000 gallons.

Since the taking up of this subject by the mun cipal authorities of various towns, there have be few reliable statistics obtainable relating to extent to which these valuable establishments a used; but it is known that the B. and W. esta lished by the several parishes either pay the working expenses wholly, or approach so near to as to encroach very little on the parish rates.

One satisfactory feature connected with the sy tem is, that when the local authorities are slow establish B. and W., wealthy manufacturers townsmen often take up the matter at their o expense, and then leave the ratepayers n more to do than to provide the small annual working accounts. As an e baths for men and boys (without w be cited the establishment opened a 1873, and presented to the corporation by M.P. for the borough. It comprises two s baths, one for men and one for boys, each long by 50 in width. There are 57 h dressing-boxes around the men's bath, and 72 boxes around the boys'. The two baths to hold 260,000 gallons of water, which is r once a week.

The least satisfactory part of the syst practical operation, is that which relates to houses. Laundresses, boarding and lo keepers, and families in the middle rank these W. rather than really poor families so because the expense is very low, not bec are unable to pay higher. It is sometimes that those for whose benefit the system was lished are ashamed to bring their scanty, and much-worn apparel to a place where it m meet the eyes of others: if this be so, surely remedy might be applied!

BATHS AND WASH-HOUSES, REGARDING. The establishment of the W. is regulated in England and acts of parliament—the 9 and 10 V 10 and 11 Vict. c. 61—which are to be as one act. The sanitary regulations a are merely permissive, and in no resp compulsory on the public; but their wi volence, and consideration for the he people, strongly recommend their adop provisions of the act may be adopted for any porated borough, or for any parish not w such incorporated borough; subject, howe case of a parish, to the approval of on Majesty's principal secretaries of case of a borough, the adopti of to the discretion of the council the expense is to be charged fund, the council being empowered to as part of the borough rate, or by a sp such sums as may from time to time be In the case, again, of a parish, it is l vestry, with the sanction of one of the of state, to decide on the adopti of in such case, the vestry shall ap three, and not more than sev to be *Commissioners* for carry of the act. Regulations these commissioners are p in expense is to be charged the vestries of any two or m carrying out the act.

The act contains numerous other provisions and regulations relating to the facilities required for the operations of the borough councils and parish commissioners: thus, they may borrow money with the approval of the Treasury; they may have money advanced to them by the Public Works Loan Commissioners; they may avail themselves of the Railway Companies Clauses Consolidation Act of 1845 for certain limited purposes, such as borrowing money on mortgage, the accountability of officers of the company, the making of by-laws subject to other provisions, and the recovery of damages and penalties.

After these preliminary facilities, the act proceeds to specify the powers of the borough councils and parish commissioners, as to erection or purchase of buildings, &c., for the purposes contemplated. Among other things, it is provided that the number of baths and the number of washing-tubs for the labouring-classes shall not be less than twice the number of those for any higher class or classes.

The council and commissioners respectively are empowered to make by-laws for regulating the use of the B. and W., which, however, shall not be enforced until they have been approved by a secretary of state. These by-laws must make sufficient provision for a variety of purposes specified in the schedule (A) to the act 9 and 10 Vict. c. 47; the scope of those purposes being to secure order, cleanliness, and decency. The charges for the use of the B. and W. are regulated by another schedule attached to the act 10 and 11 Vict. c. 61. In the baths for the labouring-classes, a single cold bath is not to exceed one penny; a single warm or vapour bath is not to exceed twopence. B. for any higher class are not to exceed three times the charges for those of the labouring-classes. In the wash houses for the labouring classes, the use of a single washing-tub, and other conveniences, is not to be charged more than one penny for one hour, or threepence for two hours together.

The various Local Management Acts, passed since the above-cited acts of 1846 and 1847, have strengthened the powers of town councils, &c., for the establishment of B. and W.; but the principle of operation remains nearly uniform—viz., that any surplus outlay, beyond the receipts from bathers and washers, shall be defrayed out of the rates. It may safely be asserted that no item in house rate is more wisely applied than this. So great is the importance attached by medical men to bathing, that the Metropolitan Board of Works is considering the expediency of establishing free public swimming-baths in the metropolis, to supplement the parochial B. and W.; but the plans are not yet (1874) developed.

BATHGATE, a town in the centre of Linlithgowshire, 17 miles west-south-west of Edinburgh. The old town lies on a steep slope, and the new on a more level site. Free-stone, coal, and carboniferous limestone, are wrought in the vicinity. In 1663, King Charles II. granted B. a charter, since which time it has been a free burgh of barony. In the vicinity is the site of an ancient castle, which Margaret, daughter of Robert the Bruce, brought as a part of her dowry to her husband, Walter, great steward of Scotland, who died here. The celebrated gas coal called Torban Hill mineral, which has been the subject of so much litigation, and of discussion and difference of opinion among scientific men, is worked here. B. has manufactures of cotton goods, but mining is the chief occupation of the inhabitants. Pop. (1871) 6942.

BATHORI, Elisabeth, the niece of Stephen Bathori, king of Poland, and wife of Count Nadasdi, a Hungarian nobleman, was born in the latter half of the 16th century. Her diabolical cruelty has condemned her memory to eternal infamy. By means of large bribes, she induced an old man-servant and two female servants to kidnap and convey to her, either by stratagem or force, young girls from the neighbouring country, whom she slowly put to death in the dungeons of her castle by the most horrible tortures. It is related that on a certain occasion, having violently struck one of her victims, the blood spirted up into her own face, and, as she fancied, left the skin whiter when it was wiped off. An infernal idea instantly possessed her. She invited to a grand banquet all the young girls round about, and caused 300 of them to be put to death, being under the impression that a bath of blood would renew her youth. So monstrous a story is probably exaggerated, but it at least shews that she was conceived capable of it. Inquiry was at length made into the appalling rumours, when it was discovered that this female fiend had murdered, in cold blood, not fewer than 650 maidens. The domestics who assisted her were either beheaded or burned alive; but the countess, whose crimes merited intimately the greater punishment, was merely imprisoned for life in her fortress of Esej, where she died in 1614.

BATHOS (Gr. *bathos*, depth) is a term employed by critics to designate a ludicrous descent from a lofty thought to a mean one, or a sinking below the ordinary level of thought in a ridiculous effort to aspire. See Climax. It is of the essence of B. that he who is guilty of it should be unconscious of his fall, and while grovelling on the earth, should imagine that he is still cleaving the heavens. A good example of B. is the well-known couplet:

And thee, Dalhousie, the great god of war,
Lieutenant-general to the Earl of Mar.

BATH-STONE, a building-stone extensively used in England on account of its beauty, is obtained from quarries in the Lower Oolite, in Wiltshire and Somersetshire. It is fine grained, of a rich cream colour, and is composed of about 94½ per cent. of carbonate of lime, and 2½ per cent. of carbonate of magnesium, but is free from silica. It is easily wrought in the quarry, some beds cutting almost as readily as chalk, and hardens on exposure to the air, but is not very durable. Within twenty-five years after the reparation of Henry VII's chapel, in Westminster Abbey, with this stone, it had begun to decompose. The name is derived from the neighbourhood of several of the quarries to Bath.

BATHURST, Earl (Henry Bathurst), an eminent Tory statesman, born 22d May 1762, son of second earl (Lord Chancellor from 1771 to 1778), was in 1804 appointed Master Worker of the Mint. In 1807, he became President of the Board of Trade, and was Secretary of State for Foreign Affairs from 11th October to 6th December 1809. Appointed, 11th June 1812, Secretary for the Colonies, in the administration of the Earl of Liverpool, he held that office for sixteen years. In 1828, in the Wellington administration, he became President of the Council, which office he retained till the resignation of the ministry in 1830. He died 26th July 1834. At the time of his death, he was a teller of the Exchequer, clerk of the Crown, and elder brother of the Trinity House, K.G., D.C.L., F.R.S., F.S.A., &c. He was much esteemed by his party. His son, Henry George, succeeded as fourth earl. He died in 1866, and was succeeded by his brother, William Lennox, fifth earl.

BATHURST, a name applied to various localities in honour of Earl Bathurst, Colonial Secretary

at the time.—1. B. *in New South Wales*, the first county that was settled beyond the Blue Mountains (q. v.), long believed to be impassable. It was not before 1813 that a practicable route was formed; and in April 1815 Governor Macquarie crossed the range by the newly made road with his lady and a numerous retinue, in order to mark with becoming 'pomp and circumstance' so important an epoch in the growth of the colony. B. has been still further distinguished in the history of New South Wales as the seat of its gold-fields. As early as 1844, the precious metal had, on geological grounds, been supposed to exist in Australia; but it was only on 12th February 1851 that Mr Hargreaves, a digger of California experience, washed the glittering prize out of a tin dish of gravel on the B. Plains. The county is bounded on the N.E. by the Macquarie, and on the S.W. by the Lachlan. The whole district is admirably adapted to pastoral pursuits. It is well watered, and, being 1970 feet above the level of the sea, it has a moderate temperature. Its chief town, which is now the third in New South Wales, is a handsome city with numerous elegant public buildings, and was erected into a municipality in 1862. Pop. (1871) of city and district, 16,826.—2. B. Island, *off North Australia*, about lat. 12° S., and long. 130° E. It is fully 2° due west of Port Essington, with Melville Island between. Its area may be estimated at 1000 square miles. Excepting the west end, which is barren, the island is densely wooded.—3. B., the principal settlement of the British colony on the Gambia. It is situated on a small island at the mouth of the river, in lat. 13° 28′ N., and long. 16° 32′ W. Pop. about 3000, chiefly negroes. The principal buildings are the government house, an hospital for liberated Africans, and Wesleyan schools. The exports consist of gum, wax, hides, ivory, gold, tortoise-shell, rice, cotton, teak, palm-oil, and native cloths.—4. B., in Upper Canada, a district on the right bank of the Ottawa, here the boundary between the two Canadas. It contains the Rideau River and Canal, thus occupying an important position with regard to the interprovincial trade. The removal, in 1858, of the seat of government to Ottawa, tended still further to promote the prosperity, of the district.—5. An island in the Arctic Ocean, intersected by the 100th meridian, and situated immediately beyond the 75th parallel. Sherard Osborn here found the vertebræ of an ichthyosaurus—one of the few instances of organic remains occurring on the American side of the polar basin. See ARCTIC OCEAN.

BATIGNOLLES, a thriving town of France, in the department Seine, north-east of Paris, of which city it forms a suburb.

BATLEY, a town in Yorkshire, near Dewsbury (q. v.).

BATN-EL-HA'GAR (Womb of Rocks), a stony district, stretching along the Nile, in lat. 21°—22° N., and long. 30° 40′—31° 10′ E. The Nile, in the upper portion of the district, is often forced by the approaching rocks into a very narrow channel, and its navigation is frequently interrupted by small islands, rocks, and cataracts. The district is peopled by Bedouins, and other Arabs, who go naked and derive a scanty subsistence from beans and the fruit of a wild shrub called *kerkedan*.

BATON—variously written Battoon, Batune, and in old French Baston—is the figure in heraldry commonly known as the Bastard Bar (q. v.).

BATON is the name of a short staff, presented by the sovereign to each field-marshal, as a symbol of his newly bestowed authority. It is also the name of the long staff carried by the drum-major of an infantry regiment.

BATON ROUGE, since 1847, capital of the state of Louisiana, having in that year superseded New Orleans. As far back as 1838 it was the seat of a college. Its population in 1870 was 6498, [illegible] the Louisiana Penitentiary, B. R. contains an asylum, where all the deaf and dumb of the state 10 to 30, and all the blind from 8 to 25, are to be educated and maintained at the public [illegible] It contains also an elegant state-house, 4 churches and 2 newspaper offices. On the opposite side, in of the Mississippi, another town of the same name contains nearly an equal population.

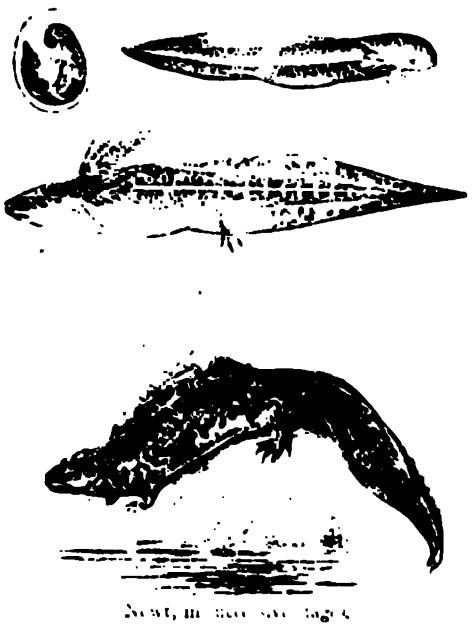
BATRA'CHIA (from Gr. *ba'trachos*, a Zoology, one of the four orders into Reptiles (q. v.) is now usually divi[illegible], some naturalists regard the differences this and the other three orders as so imp they make this a distinct class of animals, under the name *Amphibia* (q. v.). differences, the most essential and important the young B. undergo metamorphoses, and by gills alone, in the earlier part of their whilst in their adult state they either [illegible] by lungs alone, or possess at once b[illegible] gills. The body is also covered w[illegible] skin, through which water is imbibed, which the aëration of the blood app[illegible] part carried on. The B. are all ov[illegible] eggs are not covered with a hard shell, with a soft membrane. Fecundation takes place after the eggs have been deposited is sometimes given as a distinctive character that, in their adult state, they have limbs, [illegible] some genera these are very rudimentary, and are altogether wanting in *Cecilia* (q. v.), a g[illegible] which is now decidedly referred to this order. [illegible] it has been found to undergo the [illegible] from a gill-breathing to a lung-bre[illegible] which Cuvier, with hesitation, pla[illegible] pents, because the fact of its metam[illegible] not then been ascertained. The ordinary [illegible] limbs is four, but in the *Siren* (q. v.) there two.—Another character frequently given as tive of the B., that their feet are destitute of is in like manner only general, and not univ[illegible]

In the earlier period of life, form [illegible] is fish-like, of which the c[illegible] nole, [illegible] of the frog, is a familiar e[illegible] fa[illegible] some of them retain with [illegible] lu[illegible] modification, whilst some of th[illegible] a form resembling that of li[illegible] newts were indeed ranked by Linnæus in the same genus; and others, as frogs [illegible] assume a peculiar quadruped form, the tail disappearing, except in the elongated [illegible] bone which represents it to the anatomist.

In their anatomy, the adult B. present important points of resemblance to [illegible] important points, they di[illegible] fr[illegible] from other reptiles. The l[illegible] tishes in its general form, [illegible] with other reptiles in [illegible] posed. Teeth are of [illegible] they are present only in [illegible] jaw; [illegible] they are generally small and numerous, single row or aggregated. In s[illegible] of genera, however, which are refer[illegible] to the teeth are of large size.—The ribs, or they have mere r[illegible] have, however, a breast-bo[illegible] cartilaginous, to which some of [illegible] muscles are attached. They bre[illegible] gulping.—The heart of the B. [illegible] have only one auricle and one ventricle, apparently single auricle is now [illegible] two divisions. As in the [illegible]

of the blood received from the circulating system is sent to the organs of respiration, and another part returns immediately into the circulation. See REPTILES.

In the wonderful transformations which the B. undergo, the circulation of the blood is changed in accordance with the change in the organs of respiration. These, in the earliest stage, are external gills, which appear as long coloured fringes, hanging loosely upon each side of the neck. In some B., these external gills, which resemble those of the aquatic mollusca, remain till the lungs are sufficiently developed for respiration; in some, as the Axolotl (q.v.), of which a description and figure have already been given in this work, they are permanent during the whole of life. In the greater part of the B., however, the external gills soon disappear, and are replaced by internal gills, when the tadpole exhibits its most perfectly fish-like form, its mode of progression also corresponding with that of fishes. Its respiration is carried on essentially as in fishes, water entering the cavity of the mouth, and being forced out through the gill openings, so as to come in contact with the minute filaments of the gills. The gills are attached, as in fishes, to arches connected with the hyoid bone. In this stage of existence, the large arterial trunk which proceeds from the ventricle of the heart, sends forth, from a bulbous enlargement which it forms, as in fishes, an artery to each of the gills, and the blood after being aerated in them, is collected into an aorta, and proceeds into the general circulation. But an



Newt, in three stages.

artery is also provided on each side for the conveyance of blood to the lungs, both the lungs and their arteries being at first rudimentary, but increasing, whilst the gills, on the contrary, diminish along with the blood vessels connected with them; and the gill breathing is gradually transformed into a lung breathing animal, no longer perfectly aquatic, as at first, or capable of existence only in water, but amphibious, or almost entirely terrestrial, and incapable of remaining long under water without coming to the surface to breathe.—Whilst these changes take place, others no less extraordinary are also going on. The tadpole which subsisted on vegetable food, and possessed a mouth adapted to the purpose of feeding on it—a small horny beak—acquires a mouth fitted for seizing and swallowing small insects, slugs, &c., upon which the adult B. chiefly or exclusively feed, and its habits change accordingly. The mouth of the *Siren*, however, always retains a character somewhat similar to that of the tadpole.—In the course of transformation, a pelvis is formed, and limbs sprout forth, which in some B., as frogs, become very perfect and powerful. Whilst the limbs grow, with all their bones, joints, muscles, blood-vessels, and nerves, the vertebræ, in many B., diminish in number, and the tail gradually shortens and disappears.

The extremely different characters of the adult B. suggest the idea of an arresting of the metamorphosis at different stages; but whilst this idea may be helpful to our understanding of the close affinities which really pervade the whole order, it must be remembered that it does not equally apply to all parts of the animal system; and that even as to those which have been particularly mentioned in the brief account above given of the metamorphosis of the B., some in their perfect state appear to have one part in what, for convenience, may be termed a more advanced state than another; whilst all are adapted with equal perfection to the situations in which they are appointed to live, both with reference to the wants of their own existence and the preservation of that of their species.

If the limbs of the tadpole or the frog are injured or destroyed during their growth, the loss is wonderfully repaired. This power of reproducing lost limbs continues to be possessed in an extraordinary degree by the adult newt (q.v.).

B. are generally inhabitants of warm or temperate climates. Those which inhabit temperate climates generally become torpid during winter. They are either almost entirely aquatic or are found in moist situations. The British species are very few. In some of the Scottish isles they are unknown.

B. are commonly divided into two sub-orders—*Caducibranchiata*, in which the gills (*branchiæ*) disappear (are *caducous*), and *Perennibranchiata*, in which they are persistent (*perennial*). The Perennibranchiate B. are comparatively few. Axolotl, Siren, and Proteus are examples. The Caducibranchiate B. are subdivided into *Tailless* or *Anourous*, as Frogs, Toads, &c.; and *Tailed*, as Newts, Salamanders, &c. Some of the frogs and toads of warm climates are much larger than those of Britain; but the largest known B. are the *Sieboldia maximus* of Japan, and *Protonopsis horrida* of the Ohio (variously styled Hellbender, Mud Devil, Ground Puppy, Young Alligator, and Fish Salamander), both creatures of the newt or salamander form, the latter of which is two feet long, and the former is of still greater size.

Fossil remains and footprints in rock attest the existence, in former geological periods, of B. of large size. 'It is only in tertiary and post-tertiary strata that extinct species referrible to still existing genera or families of this order have been found.' These occur both of the tailed and tailless forms. One of them has been a subject of particular interest, because its remains, when first discovered by Scheuchzer, in the beginning of the 18th c., were mistaken for the remains of a human being, and the discoverer enthusiastically urged them upon the attention of his contemporaries as a proof of the deluge. To this salamandroid fossil the name *Andrias* (from the Gr. for man) *Scheuchzeri* has been given.—Footmarks in the sandstones and shales of the coal-measures in Pennsylvania seem to have belonged to B. resembling frogs or toads, but of

great size, some of the footprints being two inches in diameter, and a breadth of nearly four inches between the right and left footprints.—Some of the older batrachian fossils differ so widely from all existing types, that new sub-orders have been formed for them. Those of the sub-order *Ganocephala*—of which *Archegosaurus* (q. v.) is the best known—are remarkable for having the head covered with bony plates; those of the order *Labyrinthodontia*, for the labyrinthic structure exhibited in the transverse section of the teeth. See LABYRINTHODON.

BA'TRACHOMYOMA'CHIA (the War of the Frogs and the Mice), a Greek mock-heroic poem, erroneously ascribed to Homer, with whose works it has been generally printed. Pigres of Caria, who lived in the times of the Persian wars, was named amongst the ancients as its author. It is a parody on the *Iliad*, in which the military preparations and contests of beasts, with single combats, intervention of the gods, and other Homeric circumstances, are described with much humour.

BATRACHUS. See FROG-FISH.

BATSHIA'N, one of the Moluccas, lying to the south-west of Gilolo. It belongs to the Dutch, who, in 1610, took it from Spain, or, rather, from Portugal, then a portion of the Spanish monarchy. Its area is estimated at 900 square miles. It is almost intersected by the equator, being only 35′ S., with a long. of 127° 35′ E. B. produces large sago and cocoa palms, good rice, and the best cloves in the Moluccas. Chief town, Batshian, near the centre of the island, with a pop. of 1100.

BATTA, in relation to the British army in India, is an allowance in addition to the ordinary pay of officers. The pay is fixed; but the B. varies according to the part of the country in which the troops are placed, and also depends on the circumstance of their being in the field or in cantonments. If in the field, or more than 200 miles from the presidential government cities, the officers receive full B.; if in garrison, or in cantonment within that distance, half batta. During the troubles of 1857 and 1858, the government was frequently embarrassed in determining whether particular officers were entitled to full or half B., owing to the confusion into which the whole military system was temporarily thrown.

BATTA'LION is the unit of command in infantry. It comprises the largest number of men who, when drawn up in array, can conveniently hear the word of command from an officer. In whatever ways the armies of Europe differ in other particulars, they seldom depart very far from a mean *war*-strength of 1000 men per battalion. Two or more of those units combine to form a *regiment* (with exceptions presently to be noticed); and those regiments are further aggregated into *brigades*, *divisions*, and *corps d'armée*, or other large groupings. The unit, or B., is divided into *wings*, and these into *companies* and *squads*. The continental regiments are for the most part so large as to comprise several battalions each; but the British infantry regiments, in time of peace, have mostly only one B. each. The usual way of increasing the British infantry in war-time is, not by creating new regiments, but by increasing the number of battalions per regiment, and of companies per battalion. In 1873, there were 110 regiments of line-infantry; of these, 83 have only 1 battalion each, 25 have 2 battalions, and 2 have as many as 4. The full complement of a B. is usually 12 companies; and when these are drawn up on parade, two ranks in depth, the two choice companies, called the 'grenadier' and the 'light infantry' companies, are placed at the right and left extremities of the whole line; the other eight companies, each designated by a number or letter, being between them. In this form, the front of a B. of 1000 men is about 390 yards in length.

An English B. of 900 private soldiers approaches near 1100 strong when the officers, &c., are included. The following may be taken as the common elements, under the average war arrangement of the British service: 10 regimental staff officers (lieutenant-colonel, 2 majors, adjutant, instructor of musketry, surgeon, paymaster, and quartermaster); 36 company officers (captain, lieutenant, and lieutenant); 1 warrant officer (regimental sergeant-master); 10 non-commissioned staff officers (sergeant-major and chief sergeants); 50 non-commissioned company officers (colour-sergeants and sergeants); 900 rank and file (50 corporals, 850 privates, and 50 drummers).

The relation which the B. bears to the regiment in various details of discipline and service, is better noticed under REGIMENT; while matters of a more general nature will be found treated under BRITISH ARMY.

BATTAS, a people inhabiting that part of Sumatra between 0° 20′ and 4° 20′ N. lat. They claim to be the first settlers of Sumatra, and cling to the customs of their ancestors. The B. are light-coloured, of middle stature, have somewhat prominent features and long hair. They believe in a supreme deity and the influence of good and evil spirits. The men are lazy, and engage in hunting, while the women grow rice, collect pepper for trade, weave and dye cloth. Iron is made into large knives and weapon-points. Their houses are of wood, and their villages have earthen walls. The B. are now governed by the kings of Simamore, Salindo, and Bătar. The language is a Malay dialect, written on bamboos, in a peculiar alphabet, from the bottom upwards, but laid horizontally, and read from the left. A man pays a dowry of ten buffaloes for the chief's daughter, and five for one of lower rank, but has usually only two wives, who are as slaves. Cannibalism exists, though checked by the Dutch. They never eat the flesh of women, and only murderers, prisoners of war, and adulterers, who are first speared to death.

BATTASZE'K, a market-town of Hungary, county Tolna, on the west of the Danube. Pop. (1871) 6542.

BA'TTEL, TRIAL BY, or WAGER OF BATTEL. This relic of our legal barbarism is happily one of those things of the past, having been abolished by an act of parliament, the 59 Geo. III. c. 46, and may have been passed over with a brief notice, had it not been for a circumstance which we shall presently mention, and which affords a curious and striking illustration of a principle peculiar to the genius of English law, as distinguished from the legal systems of other countries.

The trial by B. was a proceeding by way of appeal, and it obtained in civil and criminal cases, and also in military matters, to which, indeed, it was peculiarly appropriate. It consisted of a personal combat between the parties in presence of the court; and it was grounded on the impious notion of an appeal to Providence, the expectation being that Heaven would give the victory to the injured party. In civil cases, the B. was by champions, and not by the parties themselves; but in criminal cases, the parties fought in person, unless the appellor were a woman, a person under infant, or a man of the age of sixty, or lame or blind, all of whom might refuse the wager of battel, and compel a trial by jury. Peers of the realm also could not be challenged to wage B. on account of their personal dignity, nor, by ap-

the citizens of London, fighting being con
d foreign to their education and employ-
Whether by champions or in person, the
of proceeding was the same. The appellee,
fendant, as he might be called, threw down
ove, and declared that he would prove his
or defend himself with his body. The appellor,
secutor, in accepting the challenge, took up
ove, and replied that he was ready to make
his appeal, body for body; and thereupon
rties, holding each other's hands, joined issue
the court in a very formal and solemn
r. The weapons used were batons or staves
long, and a four-cornered leathern target, and
misdants were obliged to swear that neither of
would resort to sorcery or witchcraft! The
ed till the stars appeared in the evening, and
rty who by that time had either killed or got
ter of his opponent, was considered the suc-
suitor of justice. In a charge of murder, if
cused was slain, it was taken as proof of his
and his blood was attainted; and if so far
ished as not to be able or willing to fight any
, he was adjudged guilty, and sentenced to be
l immediately!

ate as the year 1818, this barbarous procedure
demnly decided by the Court of King's Bench
a valid and legal mode of trial, which the
subjects were free to adopt! Of course, the
le was, that all laws, no matter how unsuit-
the times, could be enforced, unless expressly
ed by act of parliament. As a matter of
ity, we may give the names of the parties (they
f the labouring-class) who strenuously submitted
ontention in the above form before Lord Chief-
Ellenborough and his brother judges of the
. The case is that of Ashford v. Thornton,
reported in the first volume of Barnwall and
son's *Reports*, p. 405. As we have stated, the
decided in favour of the validity of the trial,
the judges remarking that settlement had not
tated to induce their lordships to refuse the
d another more plainly and unequivocally
ed that the defendant was entitled to this
ent mode of trial.' But Lord Ellenborough
no matter more clearly by stating, that 'the
l law of the land is in favour of the wager of
l it is our duty to pronounce the law as it is,
t as we may wish it to be; what our predi-
thereof, may justly exist a case this mode
l, still, as it is the law of the land, the court
pronounce judgment for it.' Happily, the
ous litigant who obtained this judgment
duced to commit the act, and the above statute,
Geo. III. c. 46, was passed, by which the
ng ordeal was wholly abolished.

Scotland, we believe the matter would have
lifferently disposed of; for the judges there,
ing the doctrine of the Roman law, would
ld the proceeding to have been in desuetude
bolete, and there the matter would have

Mr Rush, the then American envoy to
rench court, thus pithily marks on this
in his *Residence at the Court of London*
shed 1833). 'The appeal laws belongs to the
ture. Contrary to sound and approved
ment is complex, and works slowly; tyranny
ple, and does its work at once. An absurd
ay sleep in a free code, because overlooked;
hilst there it is the law. It is evil, I suppose,
we must reason, and generally, the reason
be right. Yet it might have been thought
n a case like this, long disused, added to obvious
lity, would have worked the silent repeal of
w, according to the doctrine of desuetude
the Roman code.'

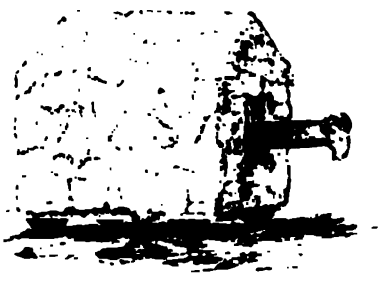
Montesquieu, in his *Spirit of Laws*, book 28, chapters 20 and 22, very ingeniously and plausibly deduces the modern practice of duelling and the so-called laws of honour from the above barbarous judicial combat. See ORDEAL.

BATTEN, or **LAY**, or **LATHE**, is the swing utensil of a loom, by which the weft or woof is struck home, and in which the shuttle runs. B. and lay are synonymous, B. being the English name, and Lay the Scotch. See WEAVING.

BATTENS, a species of sawn fir timber, of smaller dimensions than the kind called planks. B. are usually from 12 to 14 feet long, 7 inches broad, and 2¼ inches thick. Cut into two boards (1¼ inch thick), they are used for flooring; cut into three boards, they are put on roofs below slates; in narrower pieces, they are put upright on walls for fixing the laths for plastering. The best B. are brought from Norway, and sold wholesale by wood-merchants.

BATTER, in Architecture, used as a verb to express the manner in which the walls of towers, which are smaller at the top than the bottom, slope inwards. The walls of wharfs, and those built to support embankments and the like, usually batter.

BATTERING RAM, an engine of war used in ancient times, and in the middle ages. It consisted of a beam of wood, with a mass of bronze or iron on one end, resembling the head of a *ram* (in Lat. *aries*). In its simplest form, it was borne and impelled by



Battering Ram.

the hands of the soldiers; afterwards, it was suspended in a frame, and made to swing. Another form moved on rollers. The alternating motion was communicated by ropes. To protect those working it, a wooden roof (*testudo*) was constructed over it, and the whole was mounted on wheels. The beam of the ram varied from 60 to 120 feet in length, the head sometimes weighed above a ton, and as many as 100 men were employed in impelling the machine. When the blows were long enough continued, hardly any wall could resist. When or where it was invented, is unknown. It is mentioned by Ezekiel. The Romans derived it from the Greeks.

BATTERSEA, a south-west suburb of London, situated in Surrey, on the south bank of the Thames, at the bridge to Chelsea, which is nearly opposite. It lies in B. parish, which is partly laid out in market-gardens for London, and has many manufactories. The church has a monument to the celebrated Lord Bolingbroke. The flats, called B. Fields, once famed as a rural botanical station, are now formed into a public park. Adjacent to the park the Thames is crossed by B. Bridge (lately toll-free), Albert Bridge, Chelsea Suspension Bridge, and a railway bridge. The first asparagus raised near London was grown by the market-gardeners of Battersea; but railways have much changed the locality.

BA'TTERY, in criminal law, means the beating or wounding, or, more correctly, an assault by beating or wounding of another. Violence or force is not a necessary element in this offence, but the least touching, however trifling, of another's person in an angry, rude, insulting manner, is a B.; for the law, says Blackstone, cannot draw the line between different degrees of violence, and therefore totally prohibits the first and lowest stage of it, every man's person being sacred, and no one having a right to meddle with it in any the slightest manner. The remedy for an injury of this kind may be either by a civil action, as for damages, or by indictment, as for a misdemeanour. Where the B. is on a man's wife, the former may sue for damages by action of trespass, and it must be brought in the names of the husband and wife jointly; but if the maltreatment be so serious as to have deprived the husband for any time of his wife's company, the law then gives him a separate remedy, by an action in which he may recover special damage, on the ground of the loss of his wife's society, whilst suffering from the beating. By the Common Law Procedure Act, the 15 and 16 Vict. c. 76, the remedy for such ill usage is further varied, for by section 40 of that act, it is provided, that in any action brought by a man and his wife for an injury done to the latter, it shall be lawful for the husband to add thereto claims in his own right, and separate actions brought in respect of such claims may be consolidated, if the court or a judge shall think fit.

It is a good defence to prove that the alleged B. happened by accident, or that it was not in anger, or that it was merely the correction which a parent or master is entitled to use to a child, or scholar, or servant, or that it was done in self-defence, or in defence of a wife, a husband, a parent, a child, a master, or a servant; or that it was such personal force as a proper officer was entitled to employ, or that the defendant has already been summarily proceeded against under the 24 and 25 Vict. c. 100, by sections 44 and 45 of which act it is provided that further proceedings shall be barred where the complaint has been disposed of by two justices either by conviction or dismissal of the case, provided, in the former case, the defendant has paid the penalty, and suffered the imprisonment awarded; and, in the latter, the magistrates have dismissed the case, because it was justified, or so trifling as not to merit punishment, and this be forthwith certified under their hands.

In the Scotch law, there was what was called a B. *pendente lite*, which consisted in assaulting an adversary in a lawsuit during its dependence. This peculiar offence was created by two old Scotch statutes passed respectively in 1584 and 1594—and which curiously provided as a punishment the loss of the cause to the offender—but they were repealed in 1826 by the 7 Geo. IV. c. 19.

BATTERY, in military language, has two meanings: the one relating to field-operations; the other, to fortification. A battery in Field-operations consists of from 4 to 8 (in the British army, usually 6) pieces of ordnance, together with the necessary gun-carriages, ammunition-wagons, horses, artillerymen, and officers. A B. of foot-artillery (see ARTILLERY, ROYAL REGIMENT OF) is usually called a *field*-B., as distinguished from a *horse*-B. There are also *heavy* and *light* batteries, according to the weight of the ordnance. The term B. is also applied in a narrower sense to the *personnel*, or complement of men and officers attending such a set of guns. The designation for this used to be, in the foot-artillery, a *company*, and in the horse-artillery, a *troop*; but by an order issued in 1859, both these terms are now nearly superseded by the word B., thereby giving complexity to a term already used in two different meanings. The personnel of a field-B. of six 12-pounder rifled guns, is thus composed: 1 major, 1 captain, 3 lieutenants, 1 surgeon, 1 battery sergeant-major, 1 battery quartermaster-sergeant, 6 sergeants, 4 corporals, 4 bombardiers, 66 gunners, 2 trumpeters, 1 farrier and carriage-smith, 3 shoeing-smiths, 2 collar-makers, 1 wheeler, 61 drivers (privates)—in all, 158. In war, gunners and drivers would be added till the total strength of the battery became 277. Two batteries together form the command of a lieutenant-colonel, and have the services of a veterinary surgeon between them.

The *matériel* for a 12-pounder B. of 6 guns comprises 6 carriages for the guns, 1 spare gun-carriage, 3 store-wagons, 1 store-cart, 1 forge-wagon, 1 rocket-wagon, 12 gun-ammunition wagons, and 6 wagons for small-arms ammunition for the use of the infantry. To draw these guns and vehicles are required in war about 212 horses, together with 35 saddle-horses, and eight baggage-horses. The vehicles and boxes are prepared for the reception of 1284 rounds of ammunition for the guns, 150 rockets, and 98,280 rifle cartridges. There is also carried a supply of empty cartridges, port-fires, fuses, quick match, slow match, and an immense number of tools and small articles, besides stores for the wheelers, shoeing-smiths, and collar-makers. Nearly all these supplies are equally divided, so as to make each independent of the others; but some of the stores are in reserve, for the use of the whole battery.

A battery, in Fortification, is a row of large guns of any number from two to twenty or upwards, mounted on an earthwork or other platform. It differs from an artillery or field B. in having no horses or vehicles immediately belonging to it. Siege-guns are mostly placed in or on such batteries; and when an army is preparing to resist the occupation of a particular place by an enemy, a B. of position is frequently one of the defensive means adopted. On the other hand, the fortifications on and within the walls of a stronghold generally obtain other names than that of B.; although particular rows of guns in certain places may be so called. Military engineers distinguish many different kinds of batteries, according to the nature of the duty which they are to fulfil, or of the ground on which they are placed. An *elevated* B. has the parapet raised above the ground; the earth for forming it being obtained from a ditch in front. A *half-sunken* B. has the interior slope sunk a little below the surface. A *sunken* B. has the base from 24 to 42 inches below the level of the ground. The guns mounted on these three kinds of batteries partake in the varying elevations of the batteries themselves, and are adapted to different modes of firing on the enemy. A *siege*-B. consists of a range of heavy guns, for silencing the enemy's fire, ruining parapets and buildings, and making a breach through which infantry may enter. A *cavalier*-B. is especially elevated, to fire over a parapet without embrasures. *Enfilade, en revers, en écharpe, ricochet, cross*, oblique batteries, and others variously named, differ chiefly in the direction in which they pour out the fire of their guns upon the enemy. The distinction between *gun*-batteries, *howitzer*-batteries, and *mortar*-batteries, depends on the kind of ordnance employed. A mortar-B. has a ditch of extra width, to afford more earth for a platform of extra strength and solidity. A military engineer, in planning a B. imitates a civil engineer in planning a railway; he makes his calculations in such form that the quantity of earth taken out at one spot may about equal that heaped up in another.

These batteries are all nearly alike in the general principle of their construction. They consist

primarily of an *épaulement*, or built-up shelter, behind which the guns are placed; the platform on which the guns actually rest may or may not be above the ordinary level of the ground, according to the nature of the battery. The épaulement or parapet is of immense thickness, to resist the action of the enemy's cannon-balls. The thickness at the top is seldom less than 12 feet, and may be as much as 20; for it is found that a 24-pounder ball will penetrate 18 feet of earth. The guns are placed about 20 feet apart, behind the parapet. Some batteries are straight, with all the guns parallel; while others may be portions of a triangle (*redan*) or of a polygon, and the earthwork has to be constructed accordingly. There is generally a ditch from 12 to 20 feet wide, outside the earthwork; and the depth from the crest of the parapet to the bottom of the ditch is 12 to 16 feet. For gun and howitzer batteries, there are embrasures through which the firing takes place; but mortar-batteries are without those openings.

Sometimes the épaulement is thrown up loosely, in haste; but for the better kinds of batteries, fascines, gabions, and sand-bags are largely employed. The main structure is lined with fascines 9 feet long, and the embrasures lined with other fascines 18 feet long—40 or 50 of the two kinds being required per gun. The fascines here spoken of are long bundles of brush-wood, weighing 30 to 200 lbs. each. Sometimes sand-bags are used instead of fascines, each containing about a bushel of sand or earth; and sometimes gabions, which are wicker cylinders filled with earth. A 6-gun sand-bag B., made wholly of these materials, requires nearly 8000 sand-bags.

The fate of a field-B. often decides a battle. At the battle of the Alma, when once the Guards and Highlanders had reached the Russian batteries on the hill, the day was won. At the battle of Inkermann, the issue depended mainly on the possession of a small 2-gun sand-bag B., which remained, after many vicissitudes, in the hands of the allies.

BATTERY, Floating. See Floating Battery.

BATTERY, Electric and Galvanic. See Electricity and Galvanism.

BATTHYANYI, one of the oldest, richest, and most celebrated families of the Hungarian magnates, which can trace its origin as far back as the invasion of Pannonia by the Magyars, in 884 A.D., and which has given to Hungary many warriors and statesmen. The surname is derived from lands obtained in the 14th c. Balthasar von B., who was the head of the family in the latter half of the 16th c., fought with distinction in the Turkish wars, and constantly maintained at his own expense 1200 infantry and 500 cavalry.—Charles, Prince of B., a Lieutenant field marshal of the Empire, distinguished himself in the Bavarian War of Succession, and particularly by a victory over the French and Bavarians at Pfaffenhofen on 15th April 1745. Count Casimir B., a member of the principal branch of the family, was born 4th June 1807. He was Minister of Foreign Affairs in Hungary during the insurrection in 1849, in which he also distinguished himself as a military governor. After the catastrophe of Világos, he fled, along with Kossuth, into the Turkish territory, where he remained till 1851. He then went to France, and died at Paris, 13th July 1854. Count Louis B., belonging to another branch of the same family, and born at Presburg in 1809, having espoused the national cause, yet seeking to maintain the connection with Austria and his allegiance to the Austrian sovereign, was appointed President of the Ministry, when Hungary obtained a ministry of its own, in March 1848. His ability was not equal to the goodness of his intentions, and the circumstances in which he was called to act were very difficult and embarrassing. He did not hold the office long, and afterwards took part in public affairs, chiefly as a member of the diet, and with great moderation. Yet, after the Austrians entered Pesth, he was arrested in January 1849, and on 6th October was executed by sentence of martial law. His condemnation was unexpected, and awakened the more sympathy, because all men regarded it as unjust.

BATTLE, a town in East Sussex, 8 miles north-west of Hastings, where the country rises in wooded swells. Consisting of one street, built along a valley extending from N.-W. to S.-E. Pop. (1871) 3195. It is noted for its manufacture of gunpowder, well known to sportsmen as B. powder. It was anciently called Hetheland or Epiton, and derives its present name from the battle (usually called the Battle of Hastings), fought on the heath between it and Hastings, on 14th October 1066, when the Normans, under William the Conqueror, finally overthrew the Saxon dynasty in England. William, to commemorate his victory, founded in 1067, on the spot where Harold's standard was taken, a splendid abbey, which was endowed with all the land within a league of it. The abbey had the privileges of a sanctuary, and the Conqueror's sword and a roll of his barons were deposited in it. The existing ruins, which belong to a building erected subsequently to the original abbey, occupy three sides of a quadrangle, and are about a mile in circumference.

BATTLE is a combat between large masses of troops, or whole armies. Every B. ought to have for its object the determination, if possible, of the whole contest, or at least the effecting of some important step to that end. It is therefore the aim of a general to bring about an engagement at the decisive point. This constitutes Strategy, while Tactic is concerned with the handling of the troops in the actual battle. Victory on the battle-field is not enough for a general; it is only by following up his victory to the annihilation, if possible, of the beaten army, that its fruits are secured. Order of B. is the particular way in which the several corps of different arms are disposed for entering into an engagement. It varies at different times, and is modified according to locality.

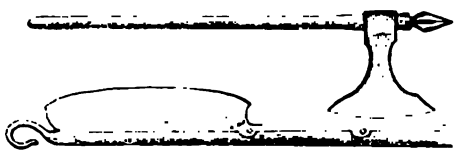
No general account of a B. can be given. Information on the various elements of which a B. consists will be found described under such heads as Attack, Artillery, Cavalry, Infantry, Charge, Fleet, Gunnery, Tactics, &c. The more important individual battles will be found described, in their causes and results, under the names of the places with which they are associated.

Considered in their political relations, the importance of battles is not always in proportion to their magnitude. 'There are some battles which claim our attention, independently of the moral worth of the combatants, on account of their enduring importance, and by reason of their practical influence on our own social and political condition, which we can trace up to the results of those engagements. They have for us an actual and abiding interest, both while we investigate the chain of causes and effects, by which they have helped to make us what we are; and also while we speculate on what we probably should have been, if any one of those battles had come to a different termination.'—Professor Creasy's *Fifteen Decisive Battles of the World, from Marathon to Waterloo.* The fifteen battles which, in Professor Creasy's opinion, have had the most decisive influence, are the following:

B.C.
490. Battle of Marathon.
413. Defeat of the Athenians at Syracuse.
331. Battle of Arbela.
207. " " the Metaurus.
A.D.
9. Defeat of the Romans under Varus.
451. Battle of Chalons.
732. " " Tours.
1066. " " Hastings.
1429. Joan of Arc's victory at Orleans.
1588. Defeat of the Spanish Armada.
1704. Battle of Blenheim.
1709. " " Pultowa.
1777. Defeat of Burgoyne at Saratoga.
1792. Battle of Valmy.
1815. " " Waterloo.

BA'TTLE, WA'GER OF. See BATTEL.

BA'TTLE-AXE was a weapon much used by the early northern nations, Celtic and Scandinavian, requiring great strength in its use. Some were held with one hand, some with two; the former kind could be wielded equally by horse and foot, but the latter was for foot-soldiers only. The B. had a longer handle, and a broader, stronger, and sharper blade than the common axe. During the



Battle-axes.

middle ages, and somewhat earlier, it was much used in sorties, and to prevent the escalading of a besieged fortress. The *pole-axe* differed but little from the battle-axe. The *black bill* and *brown bill* were a sort of halbert, having the cutting part hooked like a woodman's bill, with a spike projecting from the back, and another from the head. The *glaive* was a kind of pole-axe or bill used by the Welsh.

BA'TTLEMENT, a notched or indented parapet used in fortifications. The rising parts are called

Early English Traceried Battlement.

cops or merlons; the spaces by which they are separated, *crenels*, embrasures, and sometimes loops. The object of the device is to enable the soldier to

Simple form of Battlement.

shelter himself behind the merlon, whilst he shoots through the embrasure. The bas-reliefs of Nineveh, and the Egyptian paintings, testify to its antiquity, and there is perhaps no nation by which it has not been adopted.

BA'TTLE-PIECES are paintings representing battles. The modern mode of warfare is less favourable for this branch of art than the ancient, where personal valour had more room to display itself. Among the greatest paintings of battles, are, the battle of Constantine, sketched by Raphael and executed by Giulio Romano; Le Brun's battles of Alexander; and the battle of the Amazons by Rubens. In smaller scenes, such as skirmishes and surprises, Antonio Tempesta, Hans Snellink, Wouverman, Snyders, Fulcone, Phil. Wouverman, &c., are distinguished. The most eminent of recent battle painters is Horace Vernet.

BA'TTUE (from Fr. *battre*, to beat). The B. is a method of killing game on a great scale, by causing the animals to be driven forward to a point where a number of shooters are waiting to shoot them. The driving is effected by beating the bushes, whence the term battue. This term, like the practice which it imports, is only of modern date; the practice of killing deer by driving them forward in a gradually ever-narrowing circle to a place where they can easily be shot, is an old usage in the Highlands, where it is called the *tinchel*. The B. is at best a common-place and butcherly amusement, for it can scarcely be said to have the merit of being attended with a reasonable degree of exercise and exertion. It is practised chiefly in extensive preserves of pheasants and hares during the autumn and winter months, when country gentlemen invite acquaintances to their mansions for the sake of field-sports. The shooting takes place early in the day, and with good arms and dogs; it is attended with neither fatigue nor danger. The number of shooters is usually eight or ten, each provided with at least two guns, which are loaded by an assistant as quickly as they are discharged. When the shooters are stationed at a distance from each other, and ready to commence, the beaters begin theirs by driving the game before them. Sometimes, however, pheasants will run a long way before rising on wing, and to make them take flight on approaching the guns, a low net is sometimes drawn across their path. It should be observed that in the B., hares, rabbits, &c., are killed as well as pheasants; and at length the ground is strewed with slain, like a field of battle. In the London B., large quantities of game are killed, and sold in market; the profits derived from this species of sport on some estates amounting to no inconsiderable sum annually. For an account of B.-shooting, see *The Shot-gun and Sporting Rifle*, and *British Rural Sports* (London, 1859).

BATU'M, BATOO'M, or BATOU'M, a town in the Turkish pashalic of Trebizond, which city it is 108 miles north-east (lat. 41° 37' long. 41° 37' E.), with about 3000 inhabitants, mostly Turks and Lasians, or Lazes. Its harbour is one of the best on the east coast of the Black Sea. A pretty extensive trade is carried on. Hides, wax, honey, and, above all, oak timber for shipbuilding, are the principal exports. Great numbers of Greek churches and other buildings are to be seen in the neighbourhood, which bear witness to its importance in the middle ages when B. was a place of consequence.

BATURI'N, a town of Russia, in the government of, and 78 miles east from, the city of Tchernigov, on the Seim. It was founded by Stephen Batori, King of Poland, and was at one time the favourite residence of the Hetmans of the Cossacks. One of these, Mazeppa, who, in 1708, sold himself to Charles XII., is the most notorious. The

with its once beautiful grounds, is now going rapidly to decay.

BAUDEKYN, a corruption of Baldachin (q. v.).

BAUER, Bruno, a celebrated biblical critic and philosopher, belonging to the extreme school of German rationalism, was born at Eisenberg, in the duchy of Saxe-Altenburg, on the 6th September 1809. He is the son of a porcelain-painter, and studied at the university of Berlin, where he became doctor of theology in 1834. From this period, he has devoted himself exclusively to what is termed in Germany the scientific criticism of Scripture—that is to say, a criticism based on the conviction, that the contents of the Bible have a natural, and not a supernatural origin, and ought to be subjected to the same process of philosophical analysis as other human productions are. In 1839, B. became a *privat-docent* in the university of Bonn, but in 1842 was forbidden to deliver any more theological lectures. He then removed to Berlin, where he has since resided. He has passed through various stages of anti-supernaturalism. At first, he contented himself with believing that the substance of the Christian religion might be extricated from the entanglements of a confused and erroneous system of interpretation. Such is the idea that runs through his earliest works, his *Criticism of Strauss's Life of Jesus*, published in the Berlin *Year-book of Scientific Criticism* (1835—1836), his *Journal of Speculative Theology* (1836—1838), and his *Critical Exposition of the Religion of the Old Testament* (Berlin, 1838). He soon, however, advanced so far in his 'scientific' demands, that it became quite clear the Scriptures, in his eyes, had lost even the moderate authority which he originally supposed them to possess. To this period belong his *Doctor Hempstenberg* (Berlin, 1839), and *The Evangelical Church of Prussia and Science* (Leip. 1840). In the former of these works, B. appears as an opponent of the school of apologetic theologians, and exposes what he conceives to be the weakness of their system as a method of apprehending characteristic differences in the historical development of Christian doctrine; in the latter, he wished to prove that true philosophic union is the dissolution of the outward dogmatic church in the realm of the universal and free self-consciousness language which is not very intelligible to the finite Anglo-Saxon mind. In his *Critique of the Evangelical History of John* (Brem. 1840), and *Critique of the Evangelical Synoptic Gospels* (Leip. 1840), he attempted to shew that the so-called facts of the gospel never really had a historical existence, and that those artistic compositions which we term the gospels, were simply the product of the human self-consciousness. B. considers Strauss, a mere apologetical theologian, a comparatively orthodox writer! and regards his conclusions with the supercilious contempt of one who has reached a far higher elevation, while he conceives that his own special work in this world has been to strike off the last head of the Hydra of the Tradition-hypothesis. The persecutions to which he was now subjected brought about a complete rupture between him and the church; the consequence of which was a brochure entitled *The Question of Liberty, and my own Private Affairs* (Zurich, 1843). Then followed his *Christenthum ohne Lüge* (Zurich, 1843), in which he expressed the same conviction that he had previously done in two ironical treatises, viz., that a dogmatic religion was opposed to our self-consciousness. About this time he broke with his old friends, the liberals, by writing a pamphlet against the emancipation of the Jews, *Die Judenfrage* (Brunswick, 1843). This tractate forms the transition point to the third period of B.'s intellectual activity, in which he seems to have abandoned theology altogether as something hopeless. He now occupied himself exclusively with literature and political philosophy. The number of his writings in this department is very great. The principal are, *History of the Politics, Civilization, and Enlightenment of the 18th Century* (Charlottenburg, 1843—1845); *History of Germany during the French Revolution and the Reign of Napoleon* (Charlottenburg, 1846); *History of the French Revolution until the Establishment of the Republic* (Leip. 1847); *Western Dictatorship; The Actual Position of Russia; Germany and Russia; Russia and England.* The prominent idea in the whole of his works belonging to this period is, that the failure of the popular and national struggles in the 19th c. results from the essential weakness of the 'enlightenment' of the 18th c. More lately, B. has again returned to theology. In 1850 1851, appeared his *Critique of the Gospels and the History of their Origin*, and his *Critique of the Epistles of St Paul*, the latter of which the author considers wholly apocryphal, and written during the 2d c. Besides the works mentioned, B. has composed various other treatises on important points of history, theology, and politics. All B.'s writings exhibit great learning, industry, research, and acumen; but are completely antagonistic to the received opinions in theology, or to any form of evangelical religion. He is generally admitted to be quicker in the discovery of error than of truth, and to have a greater talent for overthrowing than for building up.

BAUGÉ, a town in the department of Maine-et-Loire, France, 23 miles east-north-east of Angers. The English, under the Duke of Clarence, were defeated here in 1421. Pop. (1872) 2891, who are engaged in the manufacture of linens and woollens.

BAUHINIA, a genus of plants of the natural order *Leguminosæ*, sub-order *Cæsalpineæ*. The upper petal is somewhat remote from the rest. The leaves are generally divided into two lobes. The species are natives of the warmer regions of both hemispheres, and some of them are remarkable for the size and beauty of their flowers. Most of them are twining plants, or *lianes*, stretching from tree to tree in the tropical forests; but some are small trees, as *B. porrecta*, the Mountain Ebony of Jamaica, so called from the colour of its wood. The inner bark of *B. racemosa* (the Malabo Climber), of *B. scandens*, and of *B. parviflora*, East Indian species, is employed for making ropes. *B. retusa* and *B. emarginata*, also East Indian, exude a brownish coloured mild gum; whilst the astringent bark of *B. variegata* is used in Malabar for tanning and dyeing leather, and also in medicine. The leaves of various species are used in Brazil as demulcent medicines, having mucilaginous properties. Livingstone mentions a species of B. in South Africa, called the Mopané Tree. It is remarkable for the little shade which its leaves afford. They fold together, and stand nearly erect during the heat of the day. On them the larvæ of a species of *Psylla* cause a saccharine secretion, in circular patches, beneath which the pupa of the insect is found. The natives scrape it off, and eat it as a dainty.

BAUMGARTEN, Alexander Gottlieb, a clear and acute thinker of the school of Wolf, was born at Berlin on the 17th of July 1714, studied at Halle, and in 1740 became Professor of Philosophy at Frankfort-on-the-Oder, where he died on the 26th of May 1762. He is the founder of Æsthetics (q. v.) as a systematic science of the beautiful, though his mode of treatment is objected to by the more transcendental Germans, as being purely psychological; that is to say, he makes æsthetics only a portion of

the philosophy of the senses, and contrasts it with logic, which belongs to the sphere of the reason. The idea of a science of the beautiful first appears in his treatise, *De Nonnullis ad Poema Pertinentibus*, published at Halle, 1735. In 1750—1758, he issued two volumes of his *Æsthetica*, but his death hindered the completion of the work. His writings in other departments of philosophy are marked by clearness and precision; his *Metaphysica* (Halle, 1739; 7th edition, 1779) is still considered one of the most useful books for the study of the Wolfian philosophy.

BAUMGARTEN-CRUSIUS, Ludwig Friedrich Otto, a German theologian, born at Merseburg, 1788, and died at Jena, 31st May 1843. He studied theology at Leipsic, and in 1810 became university preacher. In 1817, he was appointed Professor of Theology at Jena, and always distinguished himself as a champion of religious liberty, on behalf of which he wrote various treatises. In 1820 appeared his *Introduction to the Study of Dogmatics* (Leip. 1820), a work of considerable originality and richness of thought. More complete exhibitions of his opinions are to be found in his *Manual of Christian Ethics* (Leip. 1827); *Outlines of Biblical Theology* (Jena, 1828); and *Outlines of Protestant Dogmatics* (Jena, 1830). In 1831—1832, he published a *Text-book of the History of Doctrines;* in 1834, a work on *Schleiermacher, his Method of Thought, and his Value;* and also *Considerations on certain Writings of Lamennais.* After his death, Kimmel published the whole of his exegetical prelections on the Gospels and Pauline Epistles.

B. was conspicuous for the breadth and solidity of his learning, the originality of his spirit, and the acuteness of his understanding, but was nevertheless deficient in clear and vivid expression. He attached himself to no school theological or philosophical. At an early period, he had been greatly influenced by the metaphysics of Schelling, from which, however, he ultimately emancipated himself. His thinking was, to a certain extent, rationalistic, but on the whole approached more closely to the direction of the spiritual Schleiermacher.

BAUMGARTNER, Andreas Ritter von, or Chevalier de, was born at Friedberg, in Bohemia, 23d November 1793, and studied at Vienna, where, in 1823, he became Professor of Natural Philosophy. Whilst filling this office, he gave popular lectures on Sundays upon mechanics, &c., for artisans and operatives, which met with much approbation. A result of these lectures was his *Mechanik in ihrer Anwendung auf Künste und Gewerbe* (2d ed. Vienna, 1823), and his *Naturlehre* (Vienna, 1823). An ailment of the throat induced him to resign his professorship, but he was appointed director of the imperial porcelain, mirror-glass, and smalt manufactories, and afterwards superintendent of tobacco manufactories. In the year 1846, the setting up of the electric telegraph was committed to him, and he was intrusted with the principal charge of the making of the Austrian railways. After the events of March 1848, he was Minister of Mines and of Public Buildings, and chief of one of the departments in the Ministry of Finance. In May 1851, he was appointed Minister of Commerce, Trade, and Public Buildings. At the same time, he was appointed President of the Austrian Academy of Sciences, of which he had been vice-president for a number of years. He published in 1862, *Chemie und Geschichte der himmelskörper nach der Spectralanalyse*; in 1864, *Die mechan. Theorie der Wärme*. He died in 1865; and *Freiherr Von B. Eine Lebensskizze* was published during the following year.

BAUR, Ferdinand Christian, the founder of the 'New Tübingen School of Theology,' was born on the 21st of June 1792. In 1817, he became professor in the seminary of Blaubeuren, where he gave the first indications of his remarkable abilities by the publication of his *Symbolism and Mythology, or the Nature-religion of the Ancients* (Stuttgart, 3 vols., 1824—1825), a work which indicates the influence of Schleiermacher over the author. In 1826, he was called to Tübingen, where he held the chair of Protestant theology. His whole life was consecrated to religious studies—the history of doctrines, the symbolism of the church, and biblical exegesis. On account of the universality of his culture, the wonderful activity and fertility of his mind, his rare combination of speculative thought with solid knowledge, and that faculty of historic divination or insight which enabled him to draw decisive results from separate, obscure, and neglected data —he has been regarded by many in Germany as the most massive theological intellect since Schleiermacher. Unlike Bruno Bauer, he made comparatively little use of the Hegelian philosophy in his writings; and when he did, it was professedly only that he might more clearly understand historical phenomena in their internal spiritual connection, and be enabled to represent the logical process of their development. His method of investigating the progressive history of religious opinion, however, incurred the reproach of formalism from its adversaries, who said that he applied it too rigorously, and made dogmas develop themselves with a kind of abstract inevitable regularity from previous historical conditions, without allowing for immediate and extraordinary providences. His most important works in the history of doctrine are—*Die christliche Gnosis oder die christliche Religionsphilosophie* (Tübingen, 1835), (The Christian Gnosis, or the Christian Philosophy of Religion); a work which makes the Christian Gnosis of the 2d and 3d centuries the starting-point of a long series of religio-philosophical productions traceable uninterruptedly down through middle-age mysticism and theosophy to Schelling, Hegel, and Schleiermacher; *Die christliche Lehre von der Versöhnung* (Tübingen, 1838, (The Christian Doctrine of the Atonement); and *Die christliche Lehre von der Dreieinigkeit und Menschwerdung Gottes* (Tübingen, 1841—1843), (The Christian Doctrine of the Trinity and the Incarnation). In reply to Möhler, the celebrated Roman Catholic theologian, who had attacked the Protestant Church, he wrote *Der Gegensatz des Catholicismus und Protestantismus* (Tübingen, 1836), (The Opposition between Catholicism and Protestantism). Besides these works, based on a historical treatment of religion, to which class also belongs his *Lehrbuch der christlichen Dogmengeschichte* (Compendium of the History of Christian Dogmas), (Stuttgart, 1847), he published various critical treatises on parts of the New Testament; such as, *Die Christuspartei in der Korinthischen Gemeinde; der Gegensatz des Paulinischen und Petrinischen Christenthums; der Apostel Petrus in Rome* (1831), (The Christ-party in the Corinthian Community; the Opposition of the Pauline and Petrine Christianity; the Apostle Peter in Rome), a work in which the author endeavours to demonstrate the existence of deep-rooted differences in that sphere of primitive Christianity, in which we are accustomed to see nothing but unity and harmony. His inquiries concerning the Gnosis led him to study minutely the pastoral epistles, the result of which study was *Die sogenannten Pastoralbriefe des Apostels Paulus* (Stuttgart, 1835), (The So-called Pastoral Epistles of the Apostle Paul), in which he combats the idea that St Paul was their author, and refers them to the c. Of a similar nature

is his *Paulus, der Apostel Jesu Christi* (Stuttgart, 1845), (Paul, the Apostle of Jesus Christ). His work on the Gospel of John produced a startling effect, as up to B.'s time that gospel had generally been held prior in date to the three synoptic gospels, whereas B. strove hard to shew that it was of post-apostolic origin. In 1847, appeared his *Kritische Untersuchungen über die canonischen Evangelien, ihr Verhältniss zueinander, ihren Ursprung und Charakter* (Critical Inquiry Concerning the Canonical Gospels; their Relation to each other; their Origin and Character). In 1851, he published *Das Markus-evangelium nach seinem Ursprung und Charakter* (The Origin and Character of St Mark's Gospel). B. died Dec. 1860. In these and other works of a similar nature, B. maintained that we must extend our notions of the time within which the canonical writings were composed to a period considerably post-apostolic, and which can only be determined approximately by a careful investigation of the motives which apparently actuated their authors. The chief characteristic, therefore, of the 'Tübingen School,' as exhibited in the works of its founder, is, the union of a subjective criticism with a strong conviction of the historic reality of the New Testament writings. The most distinguished adherents of this new school of German theology are Zeller, Schwegler, Köstlin, and Hilgenfeld.

BAUTAIN, Louis-Eugene-Marie, a French philosopher and theologian, born at Paris, February 17, 1796. He studied under Cousin at the Normal School. In 1816, he was appointed professor of philosophy in the College of Strasbourg, and soon distinguished himself by the influence he exerted over the earnest youth of that city, who carried their admiration even to the length of imitating his walk and dress. The religious tendencies of his character, however, not finding a satisfactory expression in philosophy, he threw himself into the arms of the church, and became a priest in 1828. After the events of 1830, he resigned his professorship, which until then he had retained; but his reputation for orthodoxy, never very strong, had been destroyed in the eyes of his bishop by his work *La Morale de l'Evangile comparée à la Morale des Philosophes*, published a few years before, and he was in consequence suspended from sacred offices for several years, but reinstated in 1841. In 1838, he was made dean of the Faculty of Letters at Strasbourg, and afterwards director of the College of Juilly. At a still later period, he was translated to Paris, and appointed vicar general of the metropolitan diocese. In 1848, he attempted to give a religious direction to the revolution. He was selected as one of the professors of the Theological Faculty of Paris, and was an extremely popular preacher. His principal works are *Philosophie psychologique Expérimentale* (1840), *Philosophie Morale* (1842), *Philosophie du Christianisme* (1835), *La Religion et la Liberté considérées dans leurs Rapports* (1848), *La Morale de l'Evangile comparée aux diverses Systèmes de Morale* (1855). He died in 1867.

BAUTZEN, or, in official language, BUDISSIN, capital of the circle of the same name, kingdom of Saxony. It has a population (1871) of 13,165 including many *Wends*, remnants of the old Vandals. It is situated on a rising ground overlooking the river Spree, and is the seat of the chief offices of justice in the circle, which has a population (1871) of 330,133, including 30,000 Wends. It has several churches, a royal palace formerly the residence of the margrafs of Meissen, numerous schools, and two public libraries and an hospital. The chief branches of industry are manufactures of woollens, cotton, linen, hosiery, leather, and gunpowder. B. is a place of considerable antiquity, and was known in the time of Henry I. (931), but was first made a town under Otho I. Its several privileges, and the reputation of certain holy relics preserved in St Peter's Church, made the place important. It suffered greatly in the war with the Hussites, and still more during the Thirty Years' War. Meissner, the poet, who died in 1805, was born here. B., however, is chiefly celebrated as the place where Napoleon, with an army of 150,000 men, after an obstinate resistance, won a barren victory over 90,000 of the allied Russians and Prussians, May 20–21, 1813. The allies lost in the two days 15,000 in killed and wounded; in addition to 1500 prisoners, mostly wounded, which the French captured. The French left 5000 dead upon the field, and upwards of 20,000 were wounded. The result of the battle, and the splendid retreat of the allies, were most disheartening to the French army, and even to Napoleon himself.

BAVARIA (Ger. *Baiern*, and officially, *Bayern*), one of the states of the German empire; according to its size, the second in importance. B. is divided into two unequal parts, which are separated by the Baden and Hesse-Darmstadt dominions. The eastern portion, comprising fully eleven twelfths of the whole, is situated between lat. 47° 20′, and 50° 41 N., and long. 9° and 13° 48′ E. It is bounded N. by the Prussian province of Hesse Nassau, the Thuringian principalities, and the kingdom of Saxony; E. by Bohemia and Austria; S., by the Tyrol; and W., by Wurtemberg, Baden, and the Grand Duchy of Hesse. The western part, occupying the Rhine Palatinate, on the left bank of the Rhine, lies between lat. 48° 57′ and 49° 50′ N., and between 7° 5′ and 8° 27′ E. Rhenish Prussia, the Grand Duchy of Hesse, and Baden bound it on the W., N., and E., and France on the S.

B. is divided into eight circles, as follows:

Circles.	Area in sq. miles.	Population.
Upper Bavaria,	6,641	841,597
Lower Bavaria,	4,991	692,085
Palatinate,	2,272	613,164
Upper Palatinate,	3,659	497,291
Upper Franconia,	2,713	544,963
Middle Franconia,	2,914	561,417
Lower Franconia,	3,429	586,142
Swabia and Neuburg,	3,663	592,889
Military in France,		11,356
Total,	29,138	4,861,403

Surface, Hydrography, Railways, &c.—B. may be described as a mountainous country. It is walled in on the south-east, north-east, and north-west by mountains ranging from 3000 feet to upwards of 10,000 feet in height. The highest elevation is reached on the south, the Zugspitz of the Norse Alps being 10,150 feet high. On the east, the highest points of the Bohmerwald, dividing B. from Bohemia, are the Arber and Rachelberg, which are respectively 4613 feet and 4561 feet high. On the north-east, the Schneeberg, in the Fichtelgebirge range, attains a height of 3481 feet. A branch of this chain, which is connected on the north-west with the Thuringerwald, extends south between the rivers Regnitz and Vils. The Rhongeburge, the greatest height of which is 3000 feet, forms the northernmost chain of Bavaria. In the Rhine Palatinate, the principal mountain is the Haardt, whose culminating peak is about 2300 feet high. In the interior, B. is intersected in several directions by various less elevated ranges, alternating with extensive plains and fertile valleys. B. is rich in wood, nearly one third of its surface being covered with forests, mostly of pine and fir.

As to its *hydrography*, B. has the Rhine flowing along the whole eastern boundary of the circle of

Augsburg and Lindau on Lake Constance, a distance of 80 miles. These lines join Munich with Augsburg, Donauwörth, Nürnberg, Bamberg, Ulm, and Kufstein. B. has nearly 6000 miles of public roads, and over 1400 of telegraphs.

Climate, Soil, Products, &c.—The temperature of B. varies considerably, being cold and bleak in the mountainous regions, and very hot in summer in the plains and valleys. The climate may be described generally, however, as mild and salubrious. The soil, particularly in the valleys of the Upper and Lower Danube, is very fertile, second to none in Central Germany; but its capabilities as yet have not been fully developed, although even now the wealth of the country consists almost wholly of its agricultural produce. The plain south of Munich has been described as the granary of Germany, in consequence of its great productiveness, while the circles of Upper and Middle Franconia are styled the hop-garden of Bavaria. Wheat, rye, oats, and barley are the chief articles of produce, but buckwheat, maize, and rice are also grown to a small extent. The vine, as well as the hop-plant, is cultivated extensively in Franconia, and the wine is held in great esteem. Rhenish B. also produces good wine. The quantity annually produced in B. is estimated at upwards of 9,000,000 gallons. Fruit, tobacco, flax, hemp, linseed, liquorice, and beet-root beer, leather, glass, jewellery, optical a matical instruments, butter, cheese, &c. value of these is estimated at about £1,500 principal imports are sugar, coffee, wool stuffs, drugs, hemp, and flax. The posi gives it the transit trade between North and Austria, Switzerland and Italy.

Population, Religion, Education.—The the population of B. is much checked by tions which relate to marriages. No ma take place until the authorities who super relief of the poor are fully satisfied that t wishing to marry have adequate means a wife and family; and certain milita tions have also to be fulfilled before a enter into wedlock. These restrictive another consequence besides that of pre rapid increase of the population; they ha to increase inordinately the number of il children. B. has a very bad pre-eminen respect on the continent. In the capital, t mate births about equal the legitimate; the whole kingdom the proportion range 4·5 to 1 in 5 of the total births, equal to a of from 22½ to 20 illegitimate births. the population was 3,564,757; in 1833, and in 1855, it had only increased to During recent years, however, the increas

allows perfect toleration, guaranteeing the same civil rights to Catholic and Protestant alike. Individuals of every sect have the privilege of worshipping privately without fear of molestation; and on application to the king by a sufficient number of families, the right of public worship can be secured. A concordat with Rome divides the state into 2 archbishoprics and 6 bishoprics. The consistories of Anspach, Baireuth, and Speyer, under the superior consistory of Munich, govern the Lutheran Church, the Munich consistory being in some degree subject to a section in the home department, which manages the temporal concerns of all the churches. The president of the Munich consistory has a seat and vote in the council of the state. The revenues of the Church of Rome are derived from lands and endowments, the Protestant Church is supported by the state. Of late, the Bavarian government has become conspicuous by opposing the Ultramontanes, and encouraging the 'Old Catholics.'

B. has a good system of *education*, under the supreme direction of a minister of public instruction, to whom certain members of the provincial governments, specially instructed to watch the educational interests of the communities, are subordinate. They, again, have numerous inspectors under them, who make systematic reports as to the state of education in the country. It is obligatory on all children, whose parents have not received permission to have them educated at home, to attend school until they are 14 years of age, and they are then required to attend a Sunday school for two years longer. B. has three universities, Munich and Würzburg, which are Catholic, and Erlangen, Protestant. These universities are well attended both by natives and foreigners. Munich has the greatest repute both at home and abroad, Erlangen the least. There are numerous schools for special instruction in the kingdom.

Government, Revenue, &c.- B. is a constitutional monarchy, the throne hereditary in the male line. Its constitution dates no further back than 1818, when it was declared a part of confederated Germany. The king is the executive. The legislature consists of a chamber of senators, and one of deputies. The senators are hereditary, the king, however, having the power, within certain limits, to nominate members for life. The Chamber of Deputies consists of five different classes: one-eighth of the whole members being chosen from landed proprietors, who exercise judicial powers in right of their property, and have no seat in the upper house; another eighth from ecclesiastics of the Protestant and Roman Catholic churches; a fourth from the inhabitants of cities and market towns; and a half from landed proprietors who neither possess judicial rights, nor a seat in the other chamber. There are, besides, three members from the universities - one from each. There is one member in the Chamber of Deputies for every 7000 families, or 35,000 inhabitants. In the event of there not being a dissolution, the chamber lasts for six years. The usual length of the annual session is two months. The chambers, in ordinary circumstances, meet once a year for the dispatch of business, and it is compulsory on the king to summon them once in three years. No deliberation can take place unless two-thirds of the deputies are present. All matters relating to public burdens, &c., come first under the consideration of the Chamber of Deputies; with reference to other questions, the king exercises his own discretion as to which chamber shall first discuss them. No alteration in taxation, and no new law, can be promulgated without the consent of the legislature; but the royal prerogative is loosely defined.

The cabinet consists of seven members, chiefs of the departments of foreign affairs, justice, home affairs, public worship and instruction, finance, commerce, and public works and war. They are not necessarily members of the chambers, though they are privileged to be present at the deliberations. The privy council is composed of the king, certain royal princes, the ministers of state, and six councillors nominated by the king.

The *revenue* of B. in 1871 amounted to 87,144,606 florins of the Rhine (£7,262,050), of which 10,330,000 florins were raised by direct taxation, 27,755,155 florins by indirect taxation, the rest chiefly from domains and state monopolies. The expenditure during the same year amounted to 87,144,606 florins (£7,262,050). The interest on the national debt swallowed up about 31 per cent. of the whole expenditure; the army, 22½ per cent.; and the educational establishments, about 19¼ per cent. In 1870, the public debt amounted to 425,355,551 florins (£35,446,296), 163,428,890 florins being contracted for railways. In 1858, the public debt was 122,839,495 florins, and the debt on railways was 88,643,834 florins.

The raising of the *army* of B. was in 1871 adapted to the Prussian method of conscription, as was also that of all the states of the empire. Every Bavarian is liable to service for seven years, and no substitution is allowed. The period of active service is four years, the remaining three being spent in the army of reserve; and the soldier, after quitting the reserve, is bound to serve other five years in the Landwehr. When B., in November 1870, became one of the kingdoms of the German empire, her army, on the established conditions of its formation, was enrolled as the second corps of the imperial army, consisting of two divisions, under the command of the king of B. in times of peace, but controlled by the emperor of Germany in war. On the peace-footing, the infantry consists of 16 regiments, 48 battalions, 26,768 men in all. There are 10 battalions of cavalry, consisting of 5540, and 32 battalions of Landwehr, made up of 512 men each; the entire number of men being thus 32,820. The war-footing is, of course, on a much larger scale.

History. The Boii, a race of Celtic origin, were the first inhabitants of B. of whom tradition furnishes any account. From them, its German name, Baiern, as well as its old Latin name, Boaria, is said to have been derived. They appear to have conquered the country about 600 B.C., and they retained it until shortly before the Christian era, when they were subjugated by the Romans; the country being made an integral part of the Roman empire, under the names of Vindelicia and Noricum. After the decay of the Roman power, the Ostrogoths and Franks successively held possession of it, until Charlemagne conquered it. After his death, it was governed by lieutenants of the Frank and German kings, until 1070, when it passed into possession of the Guelph family; and it was transferred by imperial grant, in 1180, to Otho, Count of Wittelsbach, whose descendant now occupies the throne. The Rhenish Palatinate was conferred on this family by the Emperor Frederick III. in 1216. Now followed quarrels between relatives, and divisions of territory, until the dukedom of B. was severed from the Rhenish and Upper Palatinates (see PALATINATE); of the latter, however, it repossessed itself in 1621 the peace of Westphalia, in 1648, confirming the title of its princes to that possession, as well as its right to the electoral dignity to which it had been raised in 1624. In the war of the Spanish Succession, B. supported France, and suffered considerably in

consequence; but in 1777, on the extinction of the younger Wittlesbach line, it received the accession of the Rhine Palatinate. In 1805, B. was erected into a kingdom by Napoleon I. The king assisted Napoleon in his wars, and in consideration of his aid received large additions of territory. In 1813, however, the Bavarian king opportunely contrived to change sides, and thus managed to have confirmed to him, by the treaties of 1814—1815, an extent of territory nearly as valuable as the possessions which the treaties of Presburg and Vienna had given him, and which he had now to restore to Austria.

In 1818, as already intimated, the new constitution came into existence, but owing to various causes, it did not secure that measure of popular freedom and contentment that had been expected. In 1825, Louis I. ascended the throne. He was a well-meaning, liberal, and intellectual monarch, and was favourable to the liberty of the people and the press; but he lavished the wealth of the kingdom to an extravagant degree on the embellishment of the capital, and on works of art, while he neglected to a considerable extent works of practical value, that would have tended to enrich the country, diminish the public burdens, and consequently increase the welfare of his people. In 1830, a wave from the French revolution swept over the country, disturbing its equanimity, but not to any serious extent. The Bavarian government, however, took alarm, and restricted the freedom of the press. These restrictions excited so much opposition, that they were soon after rescinded, but new dissatisfaction was created by the imposition of new taxes. The Jesuits now obtained an immense influence with the king, which they used to the detriment of popular rights. The wrath of the people was further aroused against their monarch by his connection with the notorious Lola Montez, who was looked upon as an agent of the Ultramontanists—an imputation which that lady, in her autobiography, published in 1858, indignantly repudiates, maintaining that she was the inveterate enemy of that party, and the true friend of the people. In March 1848, following the example set by the French revolutionists, the people of Munich seized the arsenal, and demanded reforms and the expulsion of Lola Montez. The king had to consent; but in the same month he abdicated his throne, in accordance, says Lola Montez, with a promise made by him to her. His son, Maximilian II., ascended the throne. He died in 1864; and Louis II., a distinguished patron of Wagner, the great musician, now (1874) reigns. See GERMANY, in SUPP.

BAVARIA, a colossal female statue at Munich, which bears the name of the country of which it is a personification, is said to be second in size only to the famous Colossus of Rhodes. It was erected by King Louis I., the model having been executed by Schwanthaler. Externally, the figure bears a German aspect. A long folding garment reaches from the middle to the naked foot; over the half-naked breast a skin is cast, and the hair falls freely over the back. The brow is adorned with sprigs of oak; in the left hand, which is raised, she holds a wreath of oak; and in the right, which is bent towards the breast, a sword; at her side reposes the Bavarian lion, the guardian of her kingdom, in a sitting attitude. The statue is 65 feet high, the pedestal being 30, so that the whole monument has a height of 95 feet. The statue was cast from the bronze of Turkish and Norwegian cannon. Internally, it is very remarkable. Through the back part of the pedestal, a door leads to a stone staircase, consisting of 60 steps. The figure itself is hollow, and resembles a mine, with side-passages which lead into the lion. A staircase of cast iron, of 58 steps, leads through the neck up into the head, where there are two sofas, and several openings for the enjoyment of the view. At the highest part of the head, there is the following inscription: 'This Colossal figure, erected by Louis I., King of Bavaria, was designed and modelled by L. von Schwanthaler, and cast in bronze, in the years 1844 to 1850, by Ferdinand Miller.' The head contains standing-room for thirty-one persons. The whole figure consists of seven pieces, and the lion, of five. The monument was formally uncovered, amidst great rejoicings, on the 7th August 1850.

BA'VINS, in the pyrotechny of warfare, are small bundles of easily ignited brushwood, from two to three feet in length. They are made by arranging the bush-ends of the twigs all in one direction, tying the other ends with small cord, dipping the bush-ends into a kettle containing an inflammable composition, and drying them. They are employed among the combustible materials in fire-ships.

BAW'BEE', or BA'BEE', the popular designation of a half-penny in Scotland, now dropping out of use. The origin of the term is obscure; but it is most probably a corruption of *bas billon*, Fr. applicable to debased copper money. In the plural form, the word is often popularly used in Scotland to signify money generally. In Scottish song, it is synonymous with a girl's fortune or marriage-portion—as, *Jenny's Bawbee*.

BA'XTER, RICHARD, one of the most eminent of the Nonconformist divines, was born, November 12, 1615, of poor but genteel parents, at Rowton, in Shropshire. His early education was somewhat neglected. Instead of attending, as he wished, one of the universities, he was obliged to content himself with a course of private study, in the midst of which he was induced, singularly enough, for he was habitually serious, to try his fortune at court. Hither he accordingly hied, fortified with an introduction to the Master of the Revels. A month sufficed to convince him that he was out of his element at Whitehall, and a protracted illness after his return helped to deepen the earnestness of his religious convictions. Soon after, at the age of 23, he was ordained, and entered on the Mastership of Dudley Grammar School, from which he removed to act as assistant to a clergyman at Bridgenorth, where he resided nearly two years. In 1640, he was invited to become parish clergyman of Kidderminster, an offer which he accepted; and within a comparatively brief period, not only did he establish his reputation as one of the most remarkable preachers of the time, but what was better, succeeded in effecting a wonderful improvement in the manners of the people. On the breaking out of the civil war, his position became somewhat peculiar. Sincerely attached to monarchy, his religious sympathies were almost wholly with the Puritans; and though a Presbyterian in principle, he was far from admitting the unlawfulness of episcopacy. These views, which, some time before the Restoration, became extremely popular, were now too catholic for the general taste, and the open respect shewn by Baxter to some leading Puritans exposed him to some danger from the mob. He accordingly retired to Coventry, where he ministered for two years to the garrison and inhabitants. He afterwards accepted the office of chaplain to Colonel Whalley's regiment, and was even present at the sieges of Bridgewater, Exeter, Bristol, and Worcester. His influence was at all times exerted to mollify the intolerance of partisanship, and to promote 'the spirit of love and of a sound mind.' On the urgent invitation of his parishioners, he returned to Kidderminster, where he

health forced him to leave the army, and continued to labour there for some time. During this period, he greatly extended his fame by the publication of his *Saints' Rest* and *Call to the Unconverted*. He never dissembled his sentiments with regard to the execution of the king and the usurpation of Cromwell, even in the presence of the Protector himself, who endeavoured, without success, to enlarge his ideas on the subject of revolutions. On the return of Charles, B. was appointed one of his chaplains, and took a leading part in the conference held at the Savoy to attempt a reconciliation between the contending church factions, a project defeated by the bigoted obstinacy of the bishops. B. was tempted with the offer of the see of Hereford, but declined the honour, praying instead to be permitted to return to his beloved flock at Kidderminster. He asked no salary, but his request was refused. The Act of Uniformity at length drove him out of the English Church, and in July 1663 he retired to Acton, in Middlesex, where he spent the greater part of nine years, chiefly occupied in the composition of some of the most important of his numerous works. These he produced with a rapidity unparalleled in modern generations, at least in this one respect, that the quality was not always in the inverse ratio of the quantity. The Act of Indulgence in 1672 permitted him to return to London, where he divided his time between preaching and writing. At length, in 1685, he fell into the brutal clutches of Judge Jefferies, who condemned him, for alleged 'sedition' in his *Paraphrase of the New Testament*, to pay a fine of 500 marks, and in default, to lie in the King's Bench Prison till it was paid. The circumstances of the trial are graphically described by Macaulay in the second volume of his History. After a confinement of nearly eighteen months, B. was released and pardoned, on the mediation of Lord Powis. He lived after this to see better times, and died on the 8th December 1691, in the seventy fifth year of his age.

B. is said to have preached more sermons, engaged in more controversies, and written more books than any other Nonconformist of his age; and Dr Isaac Barrow has said of him, that 'his practical writings were never mended, and his controversial seldom confuted.' The total number of his publications exceeded 160. Of these, by far the most popular and celebrated are his *Saints' Rest*, *Call to the Unconverted*, and *Dying Thoughts*. 20,000 copies of which were sold in a twelvemonth, and it was translated into all European languages. More important, however, in a theological point of view, are his *Methodus Theologiæ* and *Catholic Theology*, in which his peculiar system—a compromise between Arminianism and Calvinism—is embodied. His autobiographical narrative is historically valuable; the review of his religious opinions is spoken of by Coleridge as one of the most remarkable pieces of writing in religious literature. A complete edition of his works, in 23 vols., with a life by Orme, was published in 1830. His Practical Works, in 4 vols., were published in 1847.

BAXTERIANS is the term that was formerly applied to those who adhered to Baxter's theological system, the peculiar doctrines of which were: 1st, That though Christ died in a special sense for the elect, yet he also died in a general sense for all; 2d, The rejection of the dogma of reprobation; 3d, That it is possible even for saints to fall away from saving grace. The tendency of Baxter's views was towards a more liberal theology, but they are deficient in logical consistency. Nevertheless, they have been, and still are, embraced by many pious people—especially among the dissenters—who shrink from accepting what they consider the hard conclusions of Calvinism, or the latitudinarian views of Arminianism. The two most eminent B. are Dr Isaac Watts and Dr Philip Doddridge.

BAY (from a Saxon root, 'to bend') is properly applied to an indentation of the sea into the land, with an opening wider than the depth. A gulf is understood to be deeper than a bay, and has often a narrow opening. These terms are often loosely applied; Baffin's Bay, e.g., is really a gulf. When the body of water is large, and the entrance narrow, it becomes a shut sea, as the Baltic, the Red Sea, &c. Hudson's Bay, the Persian Gulf, and the Gulf of Mexico, might with propriety be termed seas.

BAY, a name given to a number of trees and shrubs more or less resembling the Laurel or Victor's Laurel (*Laurus nobilis*), which is also called SWEET BAY (see LAUREL); the name *Bays*, which was once exclusively applied to the fruit, having been extended to the whole plant. The Common Laurel or Cherry Laurel (*Prunus Lauroceraus*) is sometimes called BAY LAUREL. See LAUREL.—The RED BAY of the southern states of America is *Laurus Carolinensis*. See LAUREL. The WHITE BAY of America is *Magnolia glauca* (see MAGNOLIA), and the LORDLY BAY of the same country is *Gordonia Lasianthus*. See GORDONIA.

From early times, bay-leaves have been associated with popular superstitions and usages. Along with other evergreens, they have adorned houses and churches at Christmas; and in token of rejoicing or of some meritorious deed, sprigs of bay, as well as of laurel, have been worn in the hat, or wreathed around the head. There appears to have been a notion that the B. was an antidote against the effects of thunder. In an old play, *The White Devil*, Cornelia says:

> 'Reach the bays:
> I'll tie a garland here about his head,
> 'Twill keep my boy from lightning.'

According to Shakespeare, the withering of bay-trees was reckoned an omen of death. Thus Richard says:

> 'Tis thought the king is dead; we'll not stay.
> The bay-trees in our country are withered.'

The following passage occurs in *Parkinson's Garden of Flowers*, 1629, p. 598: 'The bay-leaves are necessary both for evil uses and for physic, both for the sick and for the sound, both for the living and the dead. It serveth to adorn the house of God, as well as man; to crowne or enriche, as with a garland, the heads of the living; and to strike and decke forth the bodies of the dead; so that from the cradle to the grave, we have still use of it, we have still need of it.' For other notices of this kind respecting the B., we refer to *Brand's Popular Antiquities*, also to *Hone's Year Book*. Bay-leaves are sometimes used in cookery for the sake of flavouring.

BAY ISLANDS, a small group in the Bay of Honduras, about 150 miles to the south-east of Balize, embracing only 25 of lat., and 1° 15′ of long. The cluster was proclaimed a British colony in 1852. The chief island is Ruatan (q. v.); and the others of any consequence are Bonacca, Utila, Barburet, Helena, and Morat.

BAY OF ISLANDS, near the northern extremity of New Ulster, the more northerly of the New Zealand Isles. Lat. 35° 14′ S., long. 174° 11′ E. On its coasts, which are pretty nearly the antipodes of the Straits of Gibraltar, are the British settlements of Russell and Kororarika.

BAYA (*Ploceus Philippinus*), a small East Indian bird, of the great family of the *Fringillidæ* (q. v.), and of a genus to some of which, from their remarkable manner of constructing their nests, the name

Weaver Bird (q. v.) is often given. It is described by the older ornithologists under the name of the Philippine Grossbeak, or *Loxia Philippina*. It is yellow, spotted with brown, the throat black, the beak conical and large. Its nest is very curious. Suspended from a slender twig of a lofty branch, so that monkeys, squirrels, and serpents may not reach it, it is rendered still more secure by its form, which is very like that of a common Florence flask, the entrance, however, being from beneath, and not from above, with lateral openings to separate chambers, in one of which the female sits upon the eggs, whilst another is occupied by the male, who there pours forth his song. It is composed of fine fibres of leaves and grass. The B. is very easily tamed, will perch on the hand, and can be trained to fetch and carry at command.

BAYADE'RES (from the Portuguese *bailadeira*, that is, dancing-girl) is the name given by Europeans to the dancing-girls and singers in India, who are divided into two great classes, each comprising many subdivisions. The first of these classes, who are called Devadasi—that is, slaves to the gods—are divided into two distinct grades, according to the rank of the families whence they have sprung, the dignity of the idol to which they are devoted, and the authority and riches of the temple to which they belong. Those of the first rank are chosen from the most influential families of the Vaisya caste, to which the rich landed proprietors and merchants belong. Those of the second class are chosen from the chief Sudra families, who correspond to our mechanics. No girls can be admitted among the Devadasis but such as are still in childhood, and free from any bodily defect. The parents of the girl must renounce by a solemn agreement all right to their child, who then receives the necessary instruction. The employment of the Devadasis is to sing the praises of their god at festivals and solemn processions, to celebrate his victories and great deeds, and to dance before him, to weave the wreaths with which the images are adorned, and in general to perform subordinate offices in the temple and for the priests. On the other hand, they are excluded from the celebration of such rites and ceremonies as are accounted peculiarly sacred, as, for example, at sacrifices for the dead, suttis, &c. The Devadasis of the first rank live within the enclosure of the temple, which they are not permitted to leave without the special permission of the high priest. They must remain unmarried for life, but are, notwithstanding, permitted to choose a lover, either in or out of the temple, provided he belongs to one of the high castes. A connection with a man of low rank would be punished with the utmost severity. If they have children, the girls are brought up to their mother's profession, and the boys are educated for musicians. The Devadasis of the second rank differ but little from those of the first, but they have more freedom, as they live without the temple. A certain number of them must attend daily at the temple service, but at public processions they are all obliged to appear. They not only dance and sing before the images—for which they receive a fixed allowance of rice-money—but when summoned by the nobles, they perform at marriages, banquets, &c. All the Devadasis reverence, as their special patroness and protectress, the goddess Rambha, one of the most beautiful dancers in the paradise of Indra. They bring a yearly offering in spring to her and to the god of love. The singing-girls who travel about the country are of an essentially different class from the Devadasis. They perform only at private feasts, entertain strangers in the *tchultris*, or public inns, and get different names according to the special arts in which they excel. Some of them live indepen in bands, consisting of from 10 to 12 persons. travel about the country, and divide their with the musicians who accompany them. are under the authority of *dayas*, or old women, who receive all the money they give the girls only enough for food an Some are really the slaves of such old wo have procured them in their infancy either — pu chase or by capture, and have instructed t their art. To one of these classes belong B. who visited several of the European cou 1839. The costume of the B. is not with tain alluring charm. Their dances do not what we are accustomed to call dan rather a species of pantomime, w h by the songs recited by the acc cians. The themes of these son happy or despairing love, jealousy, have spoken with much enthusiasm of of these pantomimes; but to judge by the perfo ances of the above-mentioned B. during their v to Europe, these descriptions must be looked very much exaggerated; for altho possessed great physical agility, were wanting in dignity and grace.

BAYARD, PIERRE DU TERRAIL, CHEVA knight *sans peur et sans reproche*, born 14 Bayard, near Grenoble, was perhaps of the middle ages who deserved praise and admiration bestowed upon h modest, a sterling friend, and tender humane, and magnanimous, he held together in a symmetrical union the whole circle of the virtu After acting as page to the Duke of Savoy, entered the service of Charles VIII., whom accompanied to Italy, and gained renown a battle of Verona, where he took a fr the enemy. At the beginning of Louis XII., B. was engaged in a batt where he followed the defeated and retreat with such impetuosity that he entered the them, and was made a prisoner, but the Duc vico Sforza released him without ransom. At letta, in 1502, B., with ten other French cav fought a tournament with an equal number Spaniards, in order to decide their respective cla to superiority; and although seven French were overthrown in the first charge, the ren chiefly through B.'s bravery, after a six hou combat, was declared equal. Next, we find h fighting bravely in Spain, and against the Gen and Venetians. When Pope Julius II. declar war against France, B. hastened to support th Duke of Ferrara; but failed in his scheme b making the pope a prisoner. Subsequ won fresh laurels in Spain. In the war a VIII. of England—who had threatened Picardy, besieged Terouane, in 1513—when French, one occasion, were about to lay down a made a sudden attack on an E pointing his sword at his breast, or I take your life.' The Eng sword to B., who returned his own, say Bayard, your prisoner; and you are a emperor and the king of England exch prisoners without any demand of ransom f When Francis I. had ascended the sent into Dauphiné to make a over the Alps and through expedition, he made Prosper (Next, B. gained, at Marignano, king, who, in consequence, submitted honour of knighthood from Bayard. When V. broke into Champagne, at the head of army, B. defended Mezieres against

on his entry into Paris, he was hailed as the saviour of his country, was made knight of the order of St Michael, and appointed over a company of 100 men, led in his own name, an honour which until then had been confined to princes of the blood-royal. He was slain by an arrow from an arquebuss, while crossing the Sesia, April 30, 1524. So highly was he esteemed for all noble qualities, that his death was lamented not only by the French king and nation, but also by his enemies. His love of virtue, especially of that kingliest of virtues, *justice*, was so passionate, that he was wont to declare that all empires, kingdoms, and provinces where justice did not rule, were mere forests filled with brigands. His body was taken by the enemy, but was restored to France, and interred in the church of the Minorites' monastery, near Grenoble.

BAYAZID, or **BAYEZEED**, a town of Turkish Armenia, in the pashalic of Erzeroum, from which place it is distant east-south-east about 150 miles. It is situated about 15 miles to the south-west of the foot of Mount Ararat; is fortified; and has a population of about 5000, mostly Kurds. Prior to 1830, its population was estimated at upwards of 15,000, and it had a brisk trade; but since that time, on account of Russian interference, its commerce and inhabitants have gradually decreased. Being near the Russian frontier, it has been the scene of several conflicts; during the Crimean campaign, the Russians gained a victory over the Turks here.

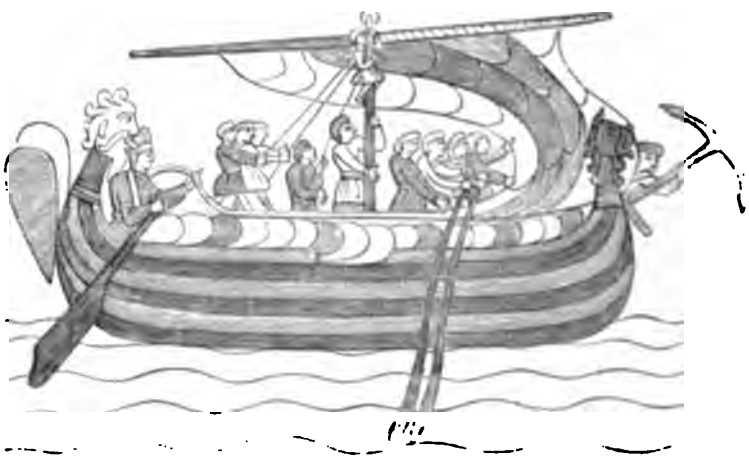
BAYAZID I. See BAJAZET.

BAYBERRY. See CANDLEBERRY.

BAYER, JOHANN, a German constructor of charts of the stars, was born, either at Augsburg or at Rhain, in Bavaria, in the latter part of the 16th c., and fulfilled the duties of a Protestant pastor in several places. His zeal for the Protestant Church was so conspicuous that he obtained the cognomen, *Os Protestantium* (the Mouth of Protestants); other accounts state that he was an advocate at Augsburg. It matters little which, as he is now remembered only on account of his *Uranometria* (1603, and 2d ed. 1639), in which he gave 51 maps of the heavens, constructed from the observations of his predecessors, and followed by explanations in his *Explicatio Characterum Encis Tabulis Inculptorum* (Stras. 1624). Although his maps are not remarkable for accuracy, even for his time, he has the merit of introducing the simple plan of distinguishing the stars of a constellation by means of letters. The largest star of the constellation he named by the first letter of the Greek alphabet (α), and the rest in the order of their apparent brilliancy, by the following letters. This convenient plan is still followed.

BAYEUX, a city of Normandy, in France, dep. Calvados, situated on the Aure, not far from its mouth. Pop. (1872) 7716. It is chiefly built of wood and plaster, is famous for its porcelain, and has also manufactories of lace, linen, calicoes, leather, and hats. It is a town of great antiquity its cathedral being said to be the oldest in Normandy. In it was preserved for centuries the famous Bayeux Tapestry (q. v.), now in the Hôtel de Ville of the place. It is the seat of a bishop, and has a college.

BAYEUX TAPESTRY, a web of canvas or linen cloth, 214 feet long by 20 inches wide, preserved in the public library, Bayeux, upon which is embroidered, in woollen thread of various colours,



Bayeux Tapestry.
Harold coming to anchor on the coast of Normandy.

a representation of the invasion and conquest of England by the Normans. Tradition asserts it to be the work of Matilda, wife of William the Conqueror, and it is believed that if she did not actually stitch the whole of it with her own hand, she at least took part in, and directed the execution of it by her maids, and afterwards presented it to the cathedral of Bayeux, as a token of her appreciation of the effective assistance which Odo, bishop, rendered to her husband at the battle of Hastings. Some antiquaries contend that it was the work not of Queen Matilda (the wife of the Conqueror), who died in 1083, but of the Empress Matilda (the daughter of King Henry I.), who died in 1167. According to Mr Bruce, the latest authority on the subject, the tapestry contains, besides the figures of 505 quadrupeds, birds, sphinxes, &c., 'the figures of 623 men, 202 horses, 55 dogs, 37 buildings, 41 ships and boats, and 49 trees—in all, 1512 figures.' The tapestry is divided into 72 distinct compartments, each representing one particular historical occurrence, and bearing an explanatory Latin inscription. A tree is usually chosen to divide the principal events from each other. This pictorial history (for so it may be called, and indeed, in several particulars, it is more minute than any written history we

have—opens with Harold, prior to his departure for Normandy, taking leave of Edward the

Bayeux Tapestry.
The crown offered to Harold by the people.

Confessor. Harold is next observed, accompanied by his attendants, riding to Bosham with his hawk and hounds; and he is afterwards seen, [illegible] embarking from the Sussex coast; [illegible] France and being made prisoner by [illegible] Ponthieu; redeemed by Willi[illegible] Duke [illegible] and meeting with him at [illegible]; against Conan, Earl of Br[illegible] sacred relics never to [illegible] succession to the Saxon th[illegible] re-embarking for England. The tap[illegible] represents Harold narrating [illegible] journey to Edward the Confessor, whose death [illegible] funeral obsequies we next see. Harold then [illegible] the crown from the Saxon people, and ascends [illegible] throne; and next we have the news brought [illegible] William, who takes counsel with his half-brother [illegible] Odo, Bishop of Bayeux, as to the [illegible] England. Then follow representations of the active war-preparations of the Normans; embarkation; disembarkation; march [illegible] and formation of a camp there; [illegible] death of Harold, with which the tapestry [illegible]

The B. T. gives an exact and minute picture of the manners and customs of the times; [illegible] been remarked that the arms and habits of the Normans are identical with those of the Danes, [illegible]

Bayeux Tapestry.—Battle of Hastings.

they appear in the miniature paintings of a manuscript of the time of King Cnut, preserved in the British Museum.

M. Lancelot appears to have been the first to direct attention to the existence of this curious monument, by a description of an illuminated drawing of a portion of it he had discovered, in a paper presented to the Academy of Inscriptions and Belles-Lettres, in 1724. This led to the discovery of the tapestry itself, in the Bayeux Cathedral, by Père Montfaucon, who published an engraving of it in 1730, with a commentary on the Latin inscriptions. In 1767, Dr Ducarel gave an account of it in his *Anglo-Norman Antiquities*. From that time until 1803, when Napoleon had it conveyed to Paris, the B. T. excited little attention. Its exhibition, however, in the National Museum there awakened public curiosity concerning it, and gave rise to various speculations as to its age, intention, &c. The discussion satisfactorily established it to be what tradition asserted it – a contemporary pictorial record of the events of the Norman Conquest. The Society of Antiquaries (London) published an engraving of the whole in the sixth volume of the *Vetusta Monumenta*. The B. T. would have been destroyed at the Revolution, had not a priest fortunately succeeded in concealing it from the mob, who demanded it to cover the guns. It was formerly preserved in the cathedral of Bayeux, where it was wont to be exhibited, on certain days every year, in the nave of the church, round which it exactly went. Bruce's *Bayeux Tapestry Elucidated* (London, 1856); *Archæologia*, vols. xvii., xviii., xix.; *Vetusta Monumenta*, vol. vi.; *Pictorial History of England*.

BAYLE, Pierre, one of the most independent thinkers in the 17th c., was born in 1647 at Carlat in the old county of Foix, France, and s[illegible] sophy under the Jesuits at Toulouse. The [illegible] of his tutors, but especially his fr[illegible]lv[illegible] and quiet disputation with a Cathol[illegible] lived in his neighbourhood, led h[illegible] orthodoxy of Protestantism, and [illegible] so far that he openly renounced his father's and adopted the Catholic one. In the course of a 17 months, however, the conversation of his tives brought him back to the Protestant profes To escape ecclesiastical censure, he now went Geneva, and thence to Coppet, where he s[illegible] philosophy of Descartes. After a few [illegible] returned to France, and in 1675 was [illegible] chair of philosophy in the unive[illegible] of this office he remained until 168[illegible], [illegible] sity was disfranchised. His next appoint[illegible] that of professor of philosophy at Rotter[illegible] appearance of a comet in 1680 having given sion to a widely spread alarm, B., in 1682, publ[illegible] his *Pensées Diverses sur la Comète*, a work learning, and treating, in discursive sty topics of metaphysics, ethics, theology, his politics. This was followed by his *Critique de l'Histoire du Calvinisme de Maimb* 1684, he commenced a periodical, *N[illegible] République des Lettres*. The rel[illegible] in France gave B. occasion to wri[illegible] *Philosophique sur ces Paroles de l[illegible] trains les d'entrer*,' which pro[illegible] a translation from the E[illegible] and a strong defence of the [illegible] tole[illegible]

consequence of the accusations brought forward by the theologian, Jurieu, who regarded B. as an agent of France, and the enemy of Protestants. B., though he skilfully defended himself, was deprived of his licence to teach (in 1693). He now assiduously devoted his leisure to the *Dictionnaire Historique et Critique* (1st edition, 2 vols. Rotterd., 1696 - last edition, 16 vols., Paris, 1820). This was the first work published under his own name. Again Jurieu came forward as B.'s adversary, and induced the consistory of Rotterdam to censure the Dictionary, chiefly on account of the supposed irreligious tendency of the article on 'David,' and the commendation bestowed on the moral character of certain atheists. B. promised to expunge all the objectionable matter; but afterwards, when he found that the public entertained a different and more favourable opinion of the peculiar passages than the Rotterdam Consistory, he judged it best to allow them to remain as they were, or made only slight alterations. New opponents were called into the arena by his *Réponse aux Questions d'un Provincial*, and the continuation of his *Pensées sur la Comète*. Jacquelot and Leclerc now attacked his religious opinions, while others persecuted him as the enemy of Protestantism and of his adopted country, Holland. These literary and theological controversies had a bad effect on his failing health, and a disease, for which he refused to employ medical aid, proved fatal. He died, December 28, 1706.

B. stands at the head of modern sceptics and logicians. Accustomed to view every question scrupulously on all sides, he was apparently led to doubt on religious matters generally; at least, it is not to be denied that his scepticism carried him the length of doubting the worth or the wisdom of the religious dogmatism that ruled both Catholics and Protestants in his day. B. was thus the antithesis of a bigot, but his hostility to bigotry rather originated in his indifference to the doctrines about which theologians quarrelled, than in any clear or high perception of the iniquity of religious persecution. With great eloquence and persistency, he vindicated the doctrine that moral characteristics and convictions may exist and flourish independently of particular religious opinions; and considering the barbarous manner in which the rival churches in B.'s time sought to enforce conformity of sentiment, and crush the liberty of private judgment, it is not to be wondered at that this doctrine, however objectionable abstractly, should have found a wide acceptance in Europe. Voltaire calls him 'a more admirable logician than a profound philosopher;' and adds that 'he knew almost nothing of physics.' This probably means no more than that he was ignorant of the then recent discoveries of Newton; for the scientific articles in the Dictionary presuppose a knowledge of the theories of Descartes (q. v.), with which he was conversant enough. The style of B. is clear and natural, but diffuse, and often impure. The articles in the Dictionary seem to have been chosen merely as vehicles to introduce numerous digressions in notes, many of which are prolix and uninteresting; but the greater number of the articles are characterised by good sense, logic, critical acumen, and great learning. Though it is impossible to detect the presence of a religious or a philosophical system in the work, it everywhere gives indications of the high intelligence, honest principle, and universal knowledge of the author. It was proscribed both in France and Holland, and was consequently very widely diffused in both countries, and has exercised an immense influence over the literature and philosophy of the continent. It was the dawn of scepticism in the 18th c., and may be historically regarded as the protest of the enlightened human intellect against the irrational dogmatism of the churches. In his personal character, B. was amiable, obliging, disinterested, and modest, but at the same time morally courageous and independent. His *Œuvres Diverses* were published in four volumes at the Hague, 1725 - 1731. See life of B. by Des Maizeaux (Amsterdam, 1712).

BAYLEN, a town in the province of Andalusia, Spain, situated 22 miles north-north-east of Jaen. It has manufactures of linen, glass, bricks, tiles, soap, &c. Pop. 4976. B. is celebrated as the place where the Spaniards won their first and only victory over the French in July 1808, and that more by accident, and the errors of the French commander, Dupont, than by good generalship on their part. About 18,000 French soldiers laid down their arms at B., the only condition being, that they should be sent to France; and other detachments of French troops afterwards offered their submission. The Spaniards, however, basely broke faith with them, and sent them to the hulks at Cadiz. The capitulation had the worst effect on the French arms. Joseph Bonaparte at once fled from Madrid, and Napoleon could find no words strong enough to express his indignation at the folly and pusillanimity of the surrender.

BAYONET, supposed to be named from Bayonne, as the place of its invention, is a dagger or small spear fixed at the end of a musket or similar weapon. The first bayonets, used in France in 1671, called *bayonets-à-manche*, had handles which fitted into the muzzle of the guns; but at a later date were introduced the *bayonets-à-douille*, or socket-bayonets, having a socket which enabled the B. so to be used as not to interrupt the firing. The use of pikes went out when that of bayonets came in. It seems very probable that the first B. was a dagger, which the musket carried by means of its handle into the muzzle of his weapon, to shield him from a cavalry charge; and that the usefulness of the contrivance suggested a permanent arrangement. Bayonets are now made with great rapidity at the government rifle factory at Enfield. Two pieces of metal are first selected viz., a piece of the very best cast steel, 7 inches long by ¾ inch square; and a piece of the best wrought-iron rod, 4 inches long by about 1 inch in thickness. The steel is to form the blade, and the iron, the socket handle. The steel being properly shaped at one end, is joined to the iron by welding. A forging machine is next employed to give a rough outline of the required shape. Then comes the action of a swaging-machine, with dies which come down upon the metal in great force, and counter dies beneath the metal. The metal is then annealed; turned in a cutting machine, to remove a wire edge thrown up in the act of stamping; cut to a proper length, and the socket end made square; drilled and bored, to make the socket hollow; shaped and furrowed along the blade; bent at the neck, hardened and tempered; and finished by a numerous train of minor operations. The Bayonet-charge is now one of the most terrible manœuvres of trained infantry, in which combination fences itself to excel all others.

BAYONNE, one of the most strongly fortified towns of France, in the department of the Basses-Pyrénées, situated at the confluence of the Adour and Nive, about 3 miles from the mouth of their united waters in the Bay of Biscay. These rivers divide the town into three parts—Great and Little B., and the suburb of St Esprit. Population in 1872, 17,977. B. is beautifully situated at the foot of the Pyrenees, and is itself a handsome place. It has extensive shipyards, rope-walks, glass-

manufactories, sugar-refineries, and distilleries, and a brisk export trade in hams, for which it is famous, chocolate, liqueurs, timber, tar, and cork. Its chief imports are wool, olive-oil, and liquorice. It is the see of a bishop, has a cathedral, a mint, and schools of commerce and navigation. B. is also historically interesting. It is said that here Catharine de' Medici and the Duke of Alba planned the massacre of the Huguenots, which took place on St Bartholomew's Day, 1572. Here the great Napoleon cozened Charles IV. out of the crown of Spain, after he had ineffectually endeavoured to get Ferdinand VII., to whom Charles had previously resigned it, to give it up. The forcing of the passage of the Nive, immediately in this vicinity, by the British, in December 1813, occasioned some of the most bloody conflicts of the Peninsular campaign. The place was invested by the British early in the following year, and a sally from it by the French, in April 14, was only repulsed after great loss on the side of the British. B. is also famous as the place where the bayonet was invented about the year 1670.

BAY'-SALT is a name applied to common salt which is obtained from sea-water by solar evaporation. It is extensively obtained from *salt-marshes* which exist along the coasts of France and on the shores of the Mediterranean. See SALT.

BAY-WI'NDOW, or (corruptly) **BOW-WI'NDOW**, a window peculiar to Gothic architecture, so called because it forms a *bay* or projecting space outwards from a room. The external walls of bay-windows are, for the most part, either rectangular or polygonal, the semicircular form from which the term *bow* was probably derived having been unknown previously to the introduction of the debased Gothic.

Bay-Window, at Compton, Wingate, Warwickshire.

Though mentioned by Chaucer, bay-windows are not found in any of the styles before the perpendicular, during the prevalence of which they were frequently introduced, particularly in halls. Bay-windows generally reach to the floor, and are frequently supplied with a seat, which is called the *bay-stall*. There are many very beautiful examples of bay windows in the colleges and halls of Oxford and Cambridge. When used in upper stories, such windows are supported on corbels, or large projecting mouldings. S. ORIEL.

BAZA (the *Basti* of the Romans), a town of Spain, in the province of Granada, and about 50 miles east-north-east of the city of that name. It is on a rich plain, is generally ill-built and irregular, with no feature of architectural interest. Population about 11,000, who are chiefly engaged in agricultural pursuits, but who also manufacture to some extent hats, linens, and earthenware. B. is famous for its red wines; and its women, according to Fa are among the prettiest in Spain. In early was a place of considerable note, and many of antiquity are still found in its vicinity. Isabella captured it from the Moors, after a two months' siege, and some of the rough iron cann used by her army still ornament the town. November 1810, the Spaniards, under Blake a Freire, were beaten in front of B. by the Fren under Soult.

BAZA'R, or **BAZAA'R**, an oriental place, either open or covered, where various including slaves, are exposed for sale, and eastern merchants meet for transaction of bu as on 'Change or at the Bourse in England a France. The B. of Ispahan is one of the mo splendid, and that of Tauris is the largest. London, Paris, and other European cities, seve places opened for the sale of various artic (chiefly fancy goods) are now styled bazars.

BAZARD, AMAND, the founder of Fren Carbonarism (q. v.), and subsequently an earnest d ciple of St Simon, was born at Paris on the of September 1791. After the Restorati with several other 'patriots,' he establ the disguise of freemasonry, the ... society of the 'Friends of Virtue;' and in concert with his friends Dugied and Joub had brought from Naples the statutes of the ... tion of Italian Carbonari, he founded a se association in France, which in the course of a ye had extended over the departments, and contain 200,000 members. He was the leading conspirat in the 'plot of Befort,' which, however, proved failure, and nearly cost him his life. A time, a change passed over Bazard. E seems to have taught him the worthlessness ... political agitation and reform. Impressed w narrow and one-sided character of common racy, and the necessity of a total reconstruc the conditions of society, before any radical impr ments could become possible, he attached himse the school of St Simon, and along with Enfantin undertook to elaborate the theoretical and speculative portion of the system. In 1825, he became on of the editors of a St Simonian journal, termed *L Producteur*. In 1828, he delivered at Paris a series of prelections on his politico-religious creed, wh met with extraordinary success. His soci views were afterwards published in the *d'œuvre* of the sect, *Exposition of the Doctrine ... Simon* (1828—1830), of which only the first was by B., the second, containing the prin of the new social religion, being the composition Enfantin. After the July revolution, a larger s was afforded to the St Simonians. The masses wer attracted by the flattering doctrine, that 'all soci institutions ought to have for their ... intellectual, and physical amelior... in a short time, B. and his ... 'created a new society, living in the old,' with peculiar laws, manners, ... But B.'s connection with it was of sh tion. He differed from Enfantin on the d a 'community of wives,' and in Novembe seceded in disgust. His efforts to found a ... his own proved unsuccessful, and duri ... discussion with his former friend ... struck with apoplexy, from the ... never recovered. He died at C ... fermeil, on the 29th July 1832.

BAZOCHE, or BASOCHE, a l ... of translation into French of the L ... i. e., royal palace. When the

ceased to be the grand council of the king, and confined itself exclusively to administering justice, a distinction of name necessarily sprang up between those noblemen who formed the royal train and the *habitués* of the court of justice. The former were called *courtiers;* the latter, *basochians*, or parliamentary clerks. But inasmuch as the word *basilica* necessarily presupposed a king, the *basochians*, to keep up their dignity, gathered round a mock one of their own making, who resided at the Château des Tournelles or the Hôtel St Pol, just as the courtiers did round the reality at the Louvre. Such was the origin of the Basochian king and kingdom. Their historical existence can be traced to the beginning of the 14th c., when Philip the Fair conferred on the brotherhood certain privileges. The principal authorities in this harmless monarchy, after the sovereign himself, were, the chancellor, the masters of requests, the referendary, and the attorney-general. Henry III. suppressed the title of king, and conferred all the privileges and rights attached to that office on the chancellor. Still the B. continued to exist as a kingdom, minus its head, and affected on all occasions the language of royalty. Its jurisdiction included the consideration and decision of all processes and debates that arose among the clerks. It administered justice twice a week, and also caused a species of coin to be struck which had currency among its members; but if we are to judge from the proverb about *la monnaie de basoche*, it did not enjoy an immense credit in the outer world of hard cash. The mock-monarch also possessed the extensive privilege of selecting at his pleasure, yearly, from the French royal forests, a tall tree, which his subjects, the clerks, were in the habit of planting, on the 1st of May, before the grand court of the palace, to the sound of tambourines and trumpets. But this was not all. In the public sports, this fantastical little kingdom was worthily honoured; its chancellor had rooms at the Hôtel de Bourgogne; at the carnival, the *basochians* joined themselves to the corps of the Prince of Fools, and to the performers of low farces and 'mysteries.' They acted in their turn a species of satirical 'morality' (q. v.), in which they made extensive use of the liberty granted to them, in ridiculing vices and the favourites of fortune. Of course, they could not fail to provoke enmity and occasion serious scandal. Louis XII. patronised these amusements. In 1500, he gave the brotherhood of the B. permission to perform plays in the grand saloon of the royal palace. Francis I. witnessed them in 1538; but in 1540, they were interdicted as incorrigible. This interdict only applied to those of Paris, for several years after, we read of the Basochian farces of Bordeaux. In their later development, they seem to have resembled the *Fastnachtspiele* (Shrove-Tuesday Spectacles), so popular in Germany both before and after the Reformation. They were the beginning of French comedy.

BDELLIUM, a gum-resin, resembling myrrh (q. v.) in appearance and qualities, but weaker, and at the same time more acrid. High medicinal virtues were ascribed to it by the ancients, but it is now little used. It is supposed to be the produce of *Balsamodendron Roxburghii* in India, and of *B. Africanum* (also called *Hedelotia Africana*) in Senegal trees or shrubs belonging to the natural order *Amyridaceæ* (q. v.), so remarkable for the number of similar substances which it produces.—EGYPTIAN B., however, is obtained from the Doom (q. v.) palm, *Hyphæne Thebaica*. A substance is yielded also by *Cerachis* . — ous plant of the natural or —siting the most sterile regions of Africa;

whilst the SICILIAN B., formerly used in medicine, is produced by *Daucus gummifer*, a species of the same genus to which the carrot belongs, growing on the coasts of the Mediterranean. The B. mentioned in Gen. ii. 12 is probably not a gum-resin at all; but what it is, is uncertain.

BEACHES, RAISED. Modern geology teaches that the frame of the land is liable to risings and depressions, even in the present age. Several districts in different parts of the world have been raised, in consequence of earthquakes, within the remembrance of the present generation. There is good proof that certain parts of Eastern Sweden, bordering on the Gulf of Bothnia, have been elevated about three feet within the last hundred years. These facts prepare us to learn that, around the British Islands, and in other parts of the earth, there are tracts of ground at various elevations above the present sea-level, which have evidently been sea-B. at a former time. The evidences consist of, first, the levelness of the ground in the general direction of the present shores over considerable spaces; second, the alternating beds of sand and gravel, such as we see composing the present B.; and, third, the presence of marine shells, which, in our country, are generally of species now living in the boreal seas. There are also what may be called terraces of erosion-indentations made in a rocky coast by the lip of the sea in ancient times usually consisting of a flat platform presenting patches of gravel, and of a backing wall or sea-cliff, the latter sometimes penetrated with deep caves. In Scotland, there is a very decided terrace of erosion all round the bold coasts of the West Highlands and Western Islands, at an elevation of about 25 feet above the level of the similar, but scarcely so well-marked indentation which the sea is now making. In Lapland, there is a similar terrace, but stooping from 220 to 85 feet in the course of thirty miles. There is also a clear and well-marked terrace of the same kind, at about 520 feet above the present sea-level, behind Trondhjem in Norway. The whole subject is treated elaborately in *Ancient Sea-margins*, by R. Chambers, 1848, where a series of gravelly terraces are described as existing in Scotland at various heights above the sea, telling of an uprise of the frame of the land in stages, and indicating by their uniformity of level that this movement was equable.

BEACHY HEAD, the loftiest headland on the south coast of England, projecting into the English Channel, 2¼ miles south-south-west of Eastbourne, Sussex. It consists of perpendicular chalk-cliffs, 564 feet high, forming the east end of the South Downs. Several caverns have been cut out in the rock, for shipwrecked seamen to take refuge in; but shipwrecks have been far fewer since 1828, when the Bell Tout Light-house was built here. This light-house is 285 feet above the sea, in lat. 50° 44′ 24″ N., long. 0° 12′ 42″ E., and is seen above 20 miles off. The view from B. H., in clear weather, extends to Hastings, the Isle of Wight, and France. The cliffs are the resort of myriads of sea-fowl. Off this point, the French fleet beat the combined English and Dutch fleets in 1690.

BEACON (allied to *beck* or *beckon*, to give a signal) denotes any signal set upon a height, but especially the alarm-fires at one time used to spread the intelligence of foreign invasion or other great event. These fire-signals were in use in the earliest times, and notices of them are found in the literary remains of ancient Persia, Palestine, and Greece. They were made by kindling a pile or bale of wood on the tops of lofty mountains, and keeping the flame bright by night, or having the fire so covered

persons in estimating the distance at which the blaze could be seen from distant mountains.

BEA'CON, in maritime affairs, is a signal for warning against dangers, or for indicating the proper entrance into a channel, harbour, or river. Generally speaking, a B. is fixed; whereas a *buoy* floats. The power of constructing these beacons rested at one time in the sovereign; but in 1565 an act of parliament empowered the Trinity House corporation to erect them on such parts of the sea-coast and forelands as appeared to be most in want of those safeguards; and tolls were levied on the maritime counties for their maintenance. In recent times, the construction of *floating* beacons has occupied a good deal of attention, as it is conceived that they might in many cases supply the place of much more costly light-houses. Messrs Brown and Lenox have constructed for the Trinity Board a B. for the Goodwin Sands—comprising a hollow wrought-iron floating vessel, with 6 water-tight compartments; a tower 28 feet high, tapering in diameter from 7 to 3½ feet; and a ball at the top of 3½ feet diameter. This B. was visible from a

number of these shorter rods are placed on a sharp cutting edge, after being annealed, and are chopped into lengths. The roughly cut beads are next mixed very thoroughly with fine sand and ashes, then put into a metal cylinder over a brisk fire, and turned round rapidly as they begin to soften with the heat. They are then agitated in water, which cleans away the sand and ashes, and leaves the holes free, after which they are strung.

BEADS, St Cuthbert's, a title popularly given to the single joints of the articulated stems of Encrinites (q. v.). The central perforation permitted them to be strung as beads; and from the fancied resemblance, in some species, of this perforation to a cross, they were formerly used as rosaries, and associated with the name of St Cuthbert:

> On a rock by Lindisfarn
> St Cuthbert sits, and toils to frame
> The sea-born beads that bear his name.

They are also known as Entrochites, or wheel-stones.

BEA'GLE, a small variety of hound, formerly much used in England for hare-hunting. It has now been almost wholly superseded by the Harrier (q. v.), to which its name is also sometimes given. The true B. is smaller than the harrier, not above ten or eleven inches in height at the shoulder, sometimes considerably smaller, stout and compact in make, with long pendulous ears, smooth-haired, sometimes dark-brown, with a streak or spot of white about

Beagle.

the neck, sometimes white with black or reddish spots. There appears to have been also a rough-haired variety. The B. is remarkable for its exquisite scent and perseverance; and although much distanced by the hare at first, is almost sure to kill it. It was customary in England, in former times, when beagles were used, to follow the chase on foot, a hunting-pole being employed to assist in leaping. During the chase, the B. gives utterance to a cry which has been regarded as particularly musical; and Queen Elizabeth had little 'singing-beagles,' one of which could be placed in a man's glove. The smaller breeds were preferred, perhaps, at first, for the prolongation of the chase; and the diminutive size of a pack or 'cry' of beagles became a boast. The smallest are sometimes called *lap-dog beagles*. The origin of the name B. is uncertain.

BEAK. See Bill.

BEA'KED, BECQUE. When the beak of a fowl is of a different tincture from the body, it is then said, in heraldry, to be beaked of such a tincture. If its legs are of the same tincture, it is then beaked, and membered so and so. In place of B., Guillim commonly says 'armed.'

BEA'KER, a term formerly in use, signifying a kind of drinking-bowl or cup, derived from the same root as the German *becher*, the Italian *bicchiere*, or the barbarous Latin *baccarium*. The Scotch call a hooped wooden dish a 'bicker.'

BEAM (Ger. *baum*, Dut. *boom*, Ang.-Sax. *beam*, signify 'a tree'), any piece of wood, long like a tree. In the arts, the word has many special technical applications. It is the name, for instance, for three parts of a weaving-loom (q. v.), for a part of the balance (q. v.), and for a part of the steam-engine (q. v.). In ship-building (q. v.), it is applied to any of the transverse pieces of framing extending across the hull. In ship measurement, it means breadth at the wales. See Tonnage. B., in engineering, is a strong stay of wood or of iron, for supporting lateral pressure. See Strength of Materials.

BEAM, of a ship, is one of the main timbers which aid in supporting the decks. Beams stretch across from side to side, aiding to strengthen and uphold the sides of the hull as well as the decks; and they are themselves supported at the ends by massive pieces, called knees, standards, and clamps. Each is made of one fine piece of timber, if possible; but if the length be too great for this, two or more timbers are scarfed together. Wherever it is practicable, the beams are upheld at or near the middle by pillars. In the *Great Eastern* steam-ship, the beams are of iron, and, like most other parts of the vessel, are cellular in construction. In the old timber-built sailing ships-of-war, now rapidly becoming obsolete, the *lock-head* B. was the broadest in the ship; the *midship* was the longest; the *orlop* was that which supported the orlop deck, and strengthened the hold. The old 74-gun ships had each 24 beams under the lower deck. Many of these characteristics still prevail; but others have given way to change, owing to the increased length of war-steamers, and to the necessity of making room for the machinery. The beams of all ships are generally made deeper in the middle than at the ends, in order that the decks supported by them may have a slight convexity on the upper surface, to carry off the rain-water readily, and to lessen the recoil of the guns.

The position of the beams, stretching across a ship at right angles to the direction of the keel, has given origin to many technical phrases used on shipboard. 'On the starboard B.' is applied to any distant point out at sea, at right angles to the keel, and on the starboard or right hand as viewed from the stern—side of the ship. 'On the larboard B.' similarly applies to the left hand. 'On the weather B.' is that side of the ship which receives or is towards the wind. 'Before the B.' is the bearing of any object when seen more in advance than *on* the beam. 'Abaft the B.' is the reverse of the expression just noted. 'On her Beam-ends' is applied to the position of a ship when so much inclined to one side that the beams become nearly vertical.

BEA'MING is a handicraft process in the cloth-manufacture preliminary to weaving, and was formerly done by the weaver himself; but it has long since become a special employment, followed by workmen trained to the business as beamers, and, like hand weaving, is tending to extinction by machinery warping and beaming, in weaving by power, being conjoined into one operation. See Weaving. B. is simply the art of winding the web on the weaver's beam in a manner suitable for weaving the two essential requirements being firmness in the winding on of the web sufficient to withstand the reaction of weaving, and evenness in the spreading of the yarn at the required width. This is effected by what is called a beaming machine, which is simply a kind of roller-mill, extending from end to end of the beamer's shop. The weaver's beam, on which the web is to be wound, is set horizontally on two upright standards

at the one end of the shop, and at the other end there is a friction-roller, set likewise level in a heavy frame, fixed to the floor, on which the web is wound like a rope, with the thrum-end out.

The number of pins or strands in the web being known, the beamer has merely to take a ravel (a comb-like utensil) with the corresponding number of teeth in the breadth required for the web, and filling each tooth successively with its respective pin, the spreading is completed; and the web being attached to the beam, the winding on of the web is a common crane operation, in which the tension on the yarn is regulated by the friction on the friction-roller. The beamer may thus beam for 400 weavers. The price of beaming a web varies from 3*d*., to perhaps 8*d*. or 10*d*.

BEAM-TREE, White (*Pyrus Aria*, see Pyrus), a tree of 20—40 feet in height, a native of almost all parts of Europe and of corresponding climates in Asia, not uncommon in the mountainous districts of Britain, and frequently planted. It has been variously referred by botanists to several allied genera, *Sorbus*, *Crataegus*, and *Mespilus*. It has a straight erect trunk, and a round or oval head; the leaves are ovate, cut and serrated (in some varieties, deeply loped), white and downy beneath; the flowers in large terminal corymbs; the fruit scarlet, of the size of small peas. The fruit is acid and astringent, but becomes agreeable by incipient decay; it is sometimes called Sorb or Service-berry, and resembles the true Service (q. v.) in quality, although much smaller. Beer is made of it by fermentation. The wood is very hard and fine-grained; it is used for cogs for the wheels of machinery. The whiteness of the foliage makes the tree—sparingly introduced—ornamental in plantations.

BEAN (*Faba*), a genus of plants of the natural order Leguminosæ, sub-order *Papilionaceæ*, included by Linnæus and many other botanists in the genus *Vicia* (see Vetch), from which it is distinguished chiefly by the leathery tumid pods, spongy within, and by the large scar on the end of the seed.—The Common B. (*F. vulgaris*, *Vicia Faba* of Linnæus) is

Bean leaves and flower.

somewhat doubtfully supposed to be a native of the borders of the Caspian Sea; it has been in cultivation from remote antiquity in Europe as well as in Asia. It is an annual plant, generally [illegible] two to four feet high, with thick angular [illegible] leaves with 2—5 oval leaflets, and dest[illegible] tendrils. The pods are thick, long, and [illegible] within; the seeds more or less ovate. The flowers, which are almost wi[illegible] ordinarily white, with a black spot [illegible] the wing: but there is a variety [illegible] entirely white, and another in which [illegible] scarlet. The flowers are deliciously fragrant. [illegible] alludes to this in the lines—

> The zephyr wantoned round the bean,
> And bore its fragrant sweets along.

A field of beans perfumes the summer [illegible] considerable distance. The varieties an[illegible] in cultivation are very numerous. d[illegible] size and form of the seed, the colo[illegible] the period which they require [illegible] height, the stem in some unbranche[illegible] divided at the base into a number of st[illegible] pods in some mostly solitary, in others [illegible] &c. The B. is cultivated both in fields [illegible] and the seeds (beans) are used for foo[illegible] also for making a sort of meal for huma[illegible] in a green state are put into broths or boiled [illegible] table. They are very nutritious, con[illegible] ripe about 36 per cent. of starch, and [illegible] legumine, a nitrogenous substance analog[illegible] caseine of milk. Whether for man or for [illegible] however, they particularly require to be mixed [illegible] other food. The straw is used for fodder, an[illegible] very nutritious when cut before it is fully ripe. B. succeeds best on a dry and moderately rich [illegible] A well-drained clay is very suitable for it. [illegible] ing and deeply penetrating root unfits it [illegible] soils. The varieties of B. preferred for [illegible] are generally much larger, both plant [illegible] than those cultivated in the field. The Winds[illegible] has seeds of a flattened, almost circular shape, [illegible] an inch in diameter; whilst those of the [illegible] or Tick B., cultivated as a field-crop, [illegible] more than half an inch in length, [illegible] three-eighths of an inch in bread[illegible] in Britain, are usually sown in [illegible] feet or more apart; and sowi[illegible] ent dates, that there may be [illegible] beans for culinary use. The [illegible]dson, Le[illegible] and Early Mazagan, are [illegible] most [illegible] garden varieties.

The roots of the B. are diuretic, and a decoction of them has been used with advantage in cases of dropsy.

B. crops are very liable to be inju[illegible] by a [illegible] of Aphis (q. v.), *A. Fabæ*, somet[illegible] [illegible] colour the Collier Aphis, and s[illegible] Dolphin Fly, which destroys [illegible] renders the plants incapable of [illegible] amount of seeds to perfect[illegible]. [illegible] remedy known is to cut [illegible] [illegible] of which are always first [illegible]d. [illegible] Aphis appears, and so to [illegible] The *topping* of beans is re[illegible]ed by, as a good practice, even [illegible] of the Aphis.

The Kidney B. (q. v.), [illegible] *vulgaris*), is an entirely [illegible] Common Bean.

BEAN, in Agricultu[illegible] to a small extent at lea[illegible] Palestine and Egypt. [illegible] Fabii are said to have [illegible]d plant. It requires a [illegible] the bean in perfecti[illegible]and [illegible] entering into a [illegible] soils of the [illegible]

maize into the south of Europe, the land under this plant has been considerably restricted. The maize thrives better, and is far more productive than the B., in warm climates. In the north of Europe, too, the potato, flax, beet, and other fallow crops are more productive and certain. Indeed, the high summer temperature of the continents of Europe and America is by no means favourable to the growth of the bean. In the west of England, the summers are rather too moist for its yielding its seeds in abundance. The straw and haulm are apt to be developed too much, and the blossoms do not set well. Beans are largely cultivated on all the better descriptions of clay soils in the eastern counties, such as Kent and Suffolk. The variety most generally grown there is the *Common Tick or Field B.*, having much resemblance to the *Scotch or Horse Bean*.

The modes of cultivation are very various, and a large breadth is still sown broad-cast. The great objection to this mode is the liability of weeds to spring up and check the growth of the crop. Beans are considered one of the fallow crops; but the soil, after it has borne a crop of beans, is little fitted for a cereal crop, unless it has been hoed and kept clean in summer. To effect this end, beans are usually sown in rows, and hoed during their early growth either by the hand or horse hoe. In preparing the land for a bean crop in England, the stubble, after being liberally dressed with farm-yard manure in autumn, receives a deep furrow, so as to expose the soil to the winter frosts. The surface is then scarified, and after being harrowed, the beans are sown in drills of 18 inches in width, at the rate of 3 to 3½ bushels per acre. The sowing begins as soon after the month of January as the soil admits of the necessary operations, and may be practised up to the middle of March. The earlier the crop is put in, the better in general is the chance of its being productive. The greater liability of the eastern counties to drought, renders the crop more subject to the attacks of insects, such as the 'black dolphin,' or *B. Aphis*, which usually makes its appearance as soon as the plant suffers from the want of moisture. For this reason, the B. crop is rather an uncertain one in the climate of the eastern counties, and other crops are gradually encroaching on the breadth which it used to occupy. The Russian or winter beans are sown in these counties to some extent in autumn, and from ripening earlier, often escape the attacks of vermin, and suffer less from the drought.

Perhaps East Lothian is as favourable, in respect both of soil and climate, to the cultivation of the field bean, as any part of Europe. The summers are comparatively cool, and the rains generally moderate, and pretty well diffused over the growing season. The crops are less liable to depredations of the 'black dolphin,' and the long period over which the growth of the plant is extended, is favourable to large crops. Sometimes the crop is sown broad-cast, when the land is clean and well manured; and it is said that as large crops have been raised in this way as by sowing in rows. The produce by this mode of cultivation, however, is much more irregular, and the land is often left in a foul condition. Drilling is therefore the general practice in cultivating this crop in the Lothians. The stubble is usually manured and ploughed in autumn, and when the weather admits, in spring it is ploughed again, and the beans are sown by a small machine in every third furrow; or the land is merely ploughed in autumn, and formed into drills or ridges by the double mould-board plough in spring. Into these the farm-yard manure is put and spread, and the beans are sown above it either broad-cast or by a three-barrelled machine. The seed is then covered by the double-moulded plough, as in the planting of potatoes. By this mode, the plants receive a plentiful supply of nutriment in their early stages of growth. When land is out of condition, or when the crop is sown upon lighter and inferior descriptions of soil, this is perhaps the most advisable method to follow. Mr Hope, during his tenancy of Fentonbarns, introduced the English method of cultivation into East Lothian. The stubble is dunged and ploughed in autumn, and as soon as the land is dry in spring, about 3 bushels of beans are drilled, 18 inches apart, by means of Garrett's machine. As soon as the crop appears above ground, Garrett's lever horse-hoe is put over the ground, to stir the surface, and keep it free from weeds. During the spring and early summer, the horse and hand hoeing are repeated as often as it is deemed advisable, until the crop covers in the land by its abundant foliage, and keeps down all weeds. Mr Hope's experiments indicated that the yield of grain is greater by the narrow than by wide drilling.

In England, the crops of beans vary from 20 to 40 bushels per acre; but in dry and warm seasons, the produce often falls below the first-named quantity. The weight per bushel is from 60 to 64 lbs. On some of the best soils in Fife, and in the Lothians, as many as 60 bushels per acre are obtained in favourable seasons, and the weight of the bushel is sometimes as much as 66 lbs. In Scotland, the straw is more abundant than in England. It forms good fodder both for cattle and horses, as well as supplying material for the dung-heap. Beans are usually cut by the sickle, allowed to lie a few days unbound to winnow, and when bound, put up into *stacks*. In late seasons, when there has been a considerable growth of leaves, they are often long before they are ready for carrying to the stack. Notwithstanding the relatively high price of beans, the breadth under this crop has been diminishing also in Scotland. It is said that the draining of the soil has not been so beneficial to the B. as to other crops. The greater returns which the land gives under potatoes in the B. soils of Fife and the Lothians since the opening of the railways, has encroached upon the extent formerly assigned to it in the six-course rotation. In the Carse of Stirling and Falkirk, it retains its hold much better, and forms the chief preparation for the wheat-crop. The field B. is now little used as an article of human food. It is considered to be specially adapted for the feeding of horses which are subjected to hard work. For this purpose, it is usually roughly ground, and mixed with a little bran. In the winter season, a portion is often boiled, and given to them at night. When the price is moderate, a mixture of ground beans and oilcake, or husked, is much esteemed for milch cows, as well as for fattening cattle and sheep. Special or light manures are less applied to the B. crop than to any other. In many instances, nitrate of soda and sulphate of lime have been used with advantage, but farm-yard manure is almost essential to its free growth.

BEAN-CAPER. See ZYGOPHYLLACEÆ.

BEAN GOOSE. See GOOSE.

BEAN-KING'S FESTIVAL, a social rite principally observed in France, from which country it would seem to have been transplanted to Germany. On the evening of Twelfth Day (q. v.), or, as the Germans call it (in allusion to the legend, that the wise men of the East who came to worship Christ were three kings), Three Kings' Day (*Dreikonigstag*), companies assemble to spend a few hours in mirthful relaxation. A large cake is baked, with a bean hidden somewhere in it. The cake is then divided

into pieces, each person present receiving one, and whoever obtains the piece with the bean is king for the year. In this capacity, he holds a mock-court, and receives the homage of the company, who also amuse themselves with other diversions. The Bean King, however, is compelled to pay for his dignity, for he has to give an entertainment on the next Twelfth Night, that an opportunity may be afforded to choose another king. In France, this custom was at an earlier period so common, that even the court indulged in it, although the church, in the 17th c., exerted itself zealously for its suppression. The opinion that the B. K. F. owes its origin to the Roman saturnalia, when even the children, partaking in the universal glee, were wont to elect a king, is not destitute of probability.

BEAN, St Ignatius's. See Strychnos.

BEAR (*Ursus*), a genus of quadrupeds, the type of a family called *Ursidæ*, belonging to the order *Feræ*, sub-order *Carnivora*, and tribe *Plantigrada*. In the Ursidæ or B. family, are included not only the true bears, but also badgers, gluttons and wolverines, racoons, coatimondis, binturongs, the kinkajou, the panda, &c. (See these articles.) Walking on the whole sole of the foot (plantigrade), the animals of this family are not, in general, capable of running very swiftly; and the nearly equal length of their fore and hind legs unfits them for leaping; most of them are also heavy both in form and gait. But whilst thus deficient in the powers which other carnivorous animals possess for obtaining prey, they really exhibit the same beautiful mutual adaptation of endowments and wants; they are, in fact, by no means strictly carnivorous; no animals are more thoroughly omnivorous than some of them; whilst others, even of the true bears, always give a decided preference to vegetable food when it can be obtained, and their teeth and digestive organs are in exact accordance with such tastes. Their jaws are much more elongated than those of feline animals, and their bite proportionally less powerful, although some of the bears are still very formidable from their great general strength and the size of their canine teeth. Their claws are not retractile, and are adapted for digging in the earth, or for climbing trees, rather than for seizing prey. All animals of the family have five toes to each both of the fore and hind feet.

Bears have six cutting teeth above, and six below, one canine tooth on each side in each jaw, with four false molars and two molars (or grinders) on each side above, and four false molars and three molars below. The false molars are, in general, soon lost by the more carnivorous species. The true molars are very large and tuberculous, the false molars comparatively small. The tuberculous crowns of the molars exhibit the adaptation to vegetable food.—The tail in all species of B. is very short, so that some of them almost appear tailless. Most of them may be described as nocturnal in their habits.

Bears are found in Europe, Asia, and North and South America, and both in warm and cold climates, the species belonging to cold climates being in general the most fierce and carnivorous. The ancients mention them as occurring in Africa; it must, therefore, be regarded as a curious circumstance that no recent accounts make certain the existence of any species in that continent. Nor is any known to belong to Australia.

The common B. of Europe, or Brown B. (*Ursus Arctos*), was at one time a native of the British islands. Bears were carried from Britain to Rome, for the cruel sports in which the Romans delighted, and they certainly were not exterminated in Scotland before the latter part of the 11th c. The Brown B. is usually about four feet long, and two and a half feet high. Its claws are about two inches long, and much curved. It has a convex forehead, and generally a brown fur, which is somewhat woolly in the younger animals, but becomes smoother with age.

Brown Bear.

It produces from one to three young ones at a birth, which remain blind for about four weeks. It is generally believed to be the only European species, although different varieties occur; and one, the Black B., has been regarded by some naturalists as specifically distinct. The common B. is very widely distributed over the whole of Europe and of the north of Asia, Japan, and North America. In America, it is known as the Barren Ground Bear. It is a solitary animal, and generally inhabits mountainous regions or thick forests. It sometimes preys on lambs, kids, &c., is fond of fish, which in some countries, as in Kamtchatka, constitute a great part of its food; climbs trees in quest of honey, eats also fruits and vegetables, and in confinement, exhibits a strong appetite for bread. It usually prefers vegetable to animal food. The skin is valued for making fur-cloaks, &c.; the flesh is used as food, often in the shape of hams, as is that of the American Black B.; the paws are esteemed a delicacy. The fat (bear's grease) is in great request as an unguent for the hair. The intestines are used in Kamtchatka, instead of glass, for windows. To the people of Kamtchatka, indeed, bears, which are there very abundant, afford many of the necessaries and comforts of life.—The common B., like others of the genus, in cold climates, usually spends the winter in a torpid state. It selects a cavern or the hollow of a tree for its hybernation, or makes a hole for itself by digging; it is also said, but this needs confirmation, sometimes to construct a sort of hut with branches of trees, lined with moss. The winter being spent without food, it is said to be very lean on the return of spring. This and other species of B. are very often killed in their winter dens.

The American Black B. (*Ursus Americanus*) is found in all parts of North America. Its total length seldom exceeds 5 feet. The fur is soft and smooth, and generally of a glossy black; but there are varieties of other colours, as the Cinnamon B., the Yellow B., &c. The American Black B. usually exhibits a timid disposition; seldom attacks man; feeds chiefly on berries, when they can be obtained; occasionally visits gardens for the sake of cabbages and other vegetables; and strongly prefers vegetable to animal food, but has recourse to the latter when pressed by hunger, and in such circumstances occasionally approaches human habitations and orchards

pigs, which it endeavours to carry off. In such cases the B. walks on its hind-legs, the pig being firmly squeezed between its fore-paws and breast, making a noise which frequently leads to a rescue. This and other species of B., when assailed, not unfrequently hug their adversaries in the manner here described, when their strength renders them very dangerous. The skin of the American Black B. is used for caps, rugs, &c., and great numbers are annually killed upon this account, chiefly by the Indians in the employment of the Hudson's Bay Company. Almost 10,000 skins are annually imported into Britain, of which, however, the greater part are again exported. In the beginning of the 19th c., the number imported was more than twice as great as now; the skins were also of much higher price. A B.'s skin is still worth from £1 to £3.—The Grisly B. (*U. ferox*) of North America, found chiefly on the Rocky Mountains and the plains to the eastward of them, from Mexico to lat. 61° N., is much larger than either of the species already noticed, and much more fierce and carnivorous. It sometimes measures more than 9 feet from nose to tail, and the claws of the fore-feet more than 6 inches in length. It has a lengthened and narrowed muzzle, a very short tail, and long grisled hair. No animal of the New World is more formidable than the Grisly B. It is capable of overpowering the bison, and dragging away the huge carcass. It feeds, however, also on fruits and roots.—The Arctic B., or Polar B., also called the White B. (*U. maritimus*), resembles this species in size and

Polar Bear.

fierceness, but is very distinctly characterised by its flat head and comparatively long neck. It has a smooth white fur. It is the only known species of B. which is strictly marine in its habits, never being found far from the sea. It inhabits the most northerly shores of Asia and America, Spitzbergen, &c., where it pursues seals, both in the water and upon the ice, and preys upon fishes, birds, &c. Amongst the articles of its food are eggs and berries in their season, and in confinement it will subsist long on bread and other vegetable food. Like other species of the genus, it displays great affection for its young, and will brave all dangers in their defence.—Of other species of B., the Syrian B. (*U. Syriacus*) may be mentioned, as perhaps the species particularly intended by the name B. in the Old Testament. It is generally of a dingy-white or brown colour, and has a stiff mane of erect hairs between the shoulders. Flocks are not safe from it, yet it more frequently commits ravages on crops of pulse. In its habits generally, it much resembles the common B.; as do also the Tibet B. (*U. Tibetanus*), and the Spectacled B. (*U. ornatus*), so called from semicircular yellow marks above its eyes, a native of the Andes of Chili.—The Long-lipped B., or Sloth B. (*U. labiatus*), of the East Indies, is the kind commonly led about by Indian jugglers. Its

Syrian Bear.

long hair, short limbs, high back, peculiarly uncouth appearance, and gentleness of disposition, recommend it for this purpose. In a wild state, it is said to feed chiefly on fruits, honey, and ants. It possesses in a remarkable degree the power, common in some measure to all the bears, of protruding the lips in order to lay hold of food.—Some other East Indian species, which feed chiefly on fruits and honey, are known as Sun-bears, as the Malayan B. (*U. Malayanus*) and the Bornean B. (*U. Eurysplius*). They are characterised by an extremely long extensile tongue. They are of gentle disposition, and become very affectionate when tamed. Sir Stamford Raffles had a Malayan B., which was very playful and quite harmless, although a powerful animal, and which shewed refinement of taste in refusing to eat any fruit but the mangosteen, or to drink any wine but champagne. This species in a wild state does much damage to cocoa-nut plantations, by climbing the trees, and eating off the terminal bud, when it is said also to drink the sap (toddy) which flows out in abundance.

Remains of several extinct species of B. have been discovered in caves in Germany, England, and other countries, some of which appear to have been larger than the present bears of Europe, and of more decided carnivorous propensities. Of these, the *U. spelæus*, or Great Cavern B., has the skull of considerable vertical elevation from the upper end of the muzzle, and larger than that of the biggest Brown B. The *U. Arctoidens* has a skull nearly of the configuration of that of the *U. Americanus*, and of the size of that of *U. spelæus*. The *U. priscus*, or Ancient B., has the skull of a smaller size, and differing less from that of living bears.

ANT B. is a name of the Great Ant-eater (q. v.).

BEAR, BERE, or BEER. See BARLEY.

BEAR, GREAT AND LITTLE. See URSA MAJOR AND MINOR.

BEAR-BAITING. In different countries, bears were formerly made objects of cruel sport, by being baited with dogs. In England, B. was one of the established amusements, not only among the common people, but among nobles, and even royalty itself; it is related that Queen Elizabeth did not consider it unbefitting her sex or rank to attend these rude entertainments. Pennant, in his *Zoology*, quoting from *The Household Book of the Earls of Northumberland*, says: 'Our nobility also kept their bearward; twenty shillings was the annual reward of that officer from his lord, the fifth Earl of Northumberland (who died 1527),

"when he comyth to my lorde in Christmas, with his lordshippe's beests for making his lordschip pastyme the said twelve days."' The places where bears were kept and publicly baited were called bear-gardens. There is a spot in the neighbourhood of the court at Westminster, which, until lately, was known as the Bear-garden. B., like bull and badger baiting, has long been unknown in England.

BEARBERRY. See ARBUTUS.

BEAR LAKE, GREAT, in British America, in N. lat. 65°—67°, and W. long. 117°—123°. It is the most northerly of that chain of fresh-water seas—Huron, Superior, Winnipeg, Athabasca, Great Slave, Great Bear—which mark a continuous hollow in the middle of the continent. Great Bear Lake is irregular in shape, with a surface estimated at 14,000 square miles, equal to about half the area of Scotland. It sends forth a river of its own name to the Mackenzie. Its height above the ocean is computed at 230 feet. The climate is, of course, severe. The rigour of the winter may be inferred from the fact, that boats are sometimes blocked up by solid ice, after the crews have begun to suffer from the heat and the mosquitoes.

BEAR-LEADER. In former times, bears were led about with a chain, muzzled, and made to dance or stand on their hind-legs for popular entertainment; small dancing-dogs being usually added, for the sake of attractiveness. As a measure of police, these somewhat dangerous and painful exhibitions are now stopped. From this old practice has been taken the phrase, B., now used jocularly to signify a discreet person who takes charge of a youth of rank on his travels to see the world.

BEAR-PIT, a pit prepared for the keeping of bears, usually seen in zoological gardens. A pit of this kind is circular, measuring about 25 feet in diameter, and 20 feet deep. The sides are built with brick; the bottom is level, and paved with stone; and around are vaults with doors for the residence of the bears. From the centre of the pit rises a stout and tall pole, on which are cross-spars at proper distances, to enable the bears to climb to the top. As is well known, the animals are fond of climbing up these poles, and catching morsels of bun from the visitors. The poles are sufficiently distant from the sides to prevent the bears from leaping out. The vaulted receptacles require to be cool and dry.

BEAR'S GREASE. Under this name there are sold by perfumers and others, large quantities of pomades, tastefully done up for the toilet, and which are represented to be of great efficacy in nourishing and promoting the growth of hair. These so-called preparations of B. G. are for the most part composed of purified beef-marrow, hog's-lard, or fat of veal, and spermaceti, along with almond oil, and some scenting ingredients. The genuine bear's fat or B. G. would appear to possess the virtue of encouraging the growth of, and strengthening the hair, in an eminent degree; but the scarcity of the commodity is such that substitute fats are employed to supply the demand. See HAIR.

BEARD, the hair which grows on the upper lip, and on the chin and cheeks of the male sex. It is usually, though not always, of the same colour as the hair of the head, but somewhat shorter, stronger, and more wiry; it is invariably the colour of the hair on the eyebrows. The B. is the distinctive sign of manhood. In women, an incipient B. sometimes appears in the later years of life. Instances also occur of women with a B. almost equal to that of the male sex, but these are recorded as prodigies. The B. is generally luxuriant in persons of the Slavic and Celtic races. The aborigines of Am who are naturally almost beardless, make selves entirely so by plucking out the hairs beard. In early times, the B. was almost all nations a sign of ment of manhood, was careful regarded as sacred. Among the sians, and many other nations, B. was, and is yet to a very great as a severe punishment and an extreme The case of David's ambassadors, rec Samuel, chap. x., illustrates the sam prevalent among the ancient Jews carry combs constantly about w purpose of dressing the beard. It immediately after prayers, the his knees during the operation. out are then carefully picked up entombment with their owner when he quently he himself deposits them beforehand destined tomb. The ancient Jews did not dy beards, and the Turks rarely, but the practice common among the Arabs and Pers Arabs dyed the B. red, not only bec that colour (being merely a paste of was easily obtainable, but because it was mation to golden yellow, the colour re by their prophet Mohammed, who hated colour the Persians preferred. The Pers are said to have interwoven their beards thread. It is customary among the Turks the B. with perfume, and to smoke it with The Jews also anointed their beards. The Mus commonly clipped their whiskers, the Jews did The Egyptians shaved their beards except in time

Egyptian Beard-case.
From the Memnon's head in the British

mourning, when they let them gr of the ancient Egyptian statues, h appear that beard-cases were worn, seem to indicate that the practice of sh not universal. The fashions of b very different at different times countries.

A neglected B. was a sign the Jews. According to Lev *of the Rites and Ceremonies of present Time*, they are iden their nails, or bathe for of a father, mother, br wife, or husband. In versally worn till the time of who ordered shaving, that the might not be laid hold battle. Shaving was i

about 300 B.C. Pliny says Scipio Africanus was the first Roman who shaved every day. Subsequently, the first day of shaving was regarded by the Romans as the entrance upon manhood, and celebrated with great festivities. Under Hadrian, the B. was allowed to grow again; and this fashion prevailed till the time of Constantine the Great, when it was discontinued. Peter the Great compelled shaving in Russia by imposing a heavy tax upon the B., and further, by having the beards of all whom he found wearing them plucked out by the roots, or shaved with a blunt razor. The B. was commonly worn in France till the time of Louis XIII., when, because the monarch was young and beardless, the fashion changed at the court and throughout the kingdom. A similar change took place in Spain on the accession of Philip V. With regard to our own country, the Anglo-Saxons wore beards for a considerable time after their invasion of Britain; and the B. appears to have been general among the people at the time of the Norman Conquest. But the Normans not only shaved themselves, but compelled the conquered to do so likewise; and many of the English preferred to leave the country rather than submit to have their whiskers shaved. It would appear, however, from the sculptured representations on the tombs of kings and nobles, that not very long after the Conquest some of the Normans adopted the custom they had prohibited among the vanquished. Edward III. is represented on his tomb in Westminster Abbey with a very long beard. In the time of Elizabeth, beards were of the most varied and fantastic cut. Taylor, the 'Water-poet,' thus satirises the extravagance of beards prevailing in that and the succeeding reign:

> Some seem as they were starched stiff and fine,
> Like to the bristles of some angry swine;
> Some cut and pruned like to a quick set hedge,
> Some like a spade, some like a fork, some square,
> Some round, some mowed like stubble, some stark bare;
> Some sharp stiletto-fashion, dagger-like,
> That may with whispering, a man's eyes out pike,
> Some with the hammer-cut, or Roman T,
> * * * *
> That heights, depths, breadths, triform, square, oval, round,
> And rules geometrical in beards are found.

The B. gradually declined under Charles I.; in the reign of Charles II., whiskers and moustaches only were worn; and the practice of shaving the whole face soon became general all over Europe; and it is only within the last 70 years that the B. has been in some measure restored, the soldiers of Bonaparte setting the example. But until within the last 20 years, it was regarded by some of the continental governments as a badge significant of democratic sentiments, and as such was interfered with by police regulations. Physicians recommend that the B. should be allowed to grow on the chin and throat in cases of liability to inflammation of the larynx or of the bronchiæ; and moustaches and whiskers are reckoned useful for prevention of toothaches and nervous diseases of the face. The British soldiers in the Crimea were allowed to wear their beards; and with some limitations, the British army generally are now permitted to do so. The wearing of the B. has, in short, been a matter of fashion in all ages and countries, an extreme in one way usually leading to an extreme in the other. At present, the tendency in England and elsewhere is to let the B. grow, though in a way suggested by the taste of the individual. The B. is itself liable to the same diseases with the hair of the head, and to a peculiar disease (*mentagra*) occasioned or kept up by shaving, consisting in a bark-like exudation from the inflamed sebaceous glands of the hair. For detailed information, see Kitto's *Pictorial Bible*; Bulwer's *Artificial Changeling* (Lond. 1653); Hotoman's *Poponias* (Leyden, 1586), reprinted in the *Lexicon* of Pitiscus; Taylor's *Whip of Satire*; &c.

BEARD MOSS. See USNEA.

BEARDIE. By this name is the little fish called the loach known in Scotland. See LOACH.

BEARING, of a ship at sea, is the direction in which she sails, in reference to the points of the compass. Or, in a more comprehensive sense, it is the direction in which each of two objects is situated in reference to the other. When the latitudes and longitudes of two places are known, their respective bearings from each other can be calculated by trigonometry. On shipboard, seamen often conveniently refer the B. of another ship, or of an object on shore, not to the points of the compass, but relatively to the line followed at the moment by the ship's keel. Thus, the B. of the distant object may be *ahead*, *astern*, on the *starboard bow*, on the *larboard quarter*, &c.; the bow being between the head and the midship, and the quarter between the midship and the stern.

Bearing, or rather the verb *to bear*, is much used as a technical direction on shipboard. Thus, to 'bear in with the land,' to 'bear off from the land,' to 'bear up,' to 'bear away,' &c., are nearly equivalent to sailing, or steaming, or steering, in such and such directions.

BEARING THE BELL, a phrase which signifies to take the lead or first place in anything, or to carry away the prize. This old colloquial phrase is said to have originated in a practice, at the early part of the seventeenth c., of giving a small golden or silver bell as a prize to the winner at horse-races. See BELL. In Dudley Lord North's *Forest of Varieties*, p. 175, we read:

> Jockey and his horse were by their masters sent
> To put in for the bell:
> Thus right, and each to other fitted well,
> They are to run, and cannot miss the bell.

BEARN, formerly one of the thirty-two provinces into which France was divided, and now forming the greatest portion of the Basses-Pyrénées. B. was a portion of Aquitania under the Romans, and after the downfall of that empire, under its ruling dukes, it was a country of considerable importance. From the intermarriage of the ruling family, the Counts of Foix, with that of Navarre, sprang the French monarch Henry IV., who, because he was born and brought up in B., was derisively called the Bearnois. When he ascended the throne of France, it, of course, virtually became a part of that country; but was only formally incorporated with it in 1620 by Louis XIII. In 1813, after the British had crossed the Nive, and established themselves in Urogne, St Jean de Luz, &c., the rich fields of B. furnished them ample supplies, the peasants taking their produce, for which they were well paid, as regularly to the British stations as to market.

BEAS, anciently *Hyphasis*, one of the five rivers which give name to the *Punjab*, or land of five waters—Jelum, Chenab, Ravee, Beas, and Sutlej. It rises on the verge of the Ritanka Pass of the Himalaya, in lat. 32° 34′ N., and long. 77° 17′ E., its source being 13,200 feet above the sea-level. After a course of about 220 miles, it joins the Sutlej, 35 miles to the south-south-east of Amritsar. It is subject to periodical rises and falls, being in the dry season generally fordable; but after the rainy months, it is sometimes nearly half a mile in

breadth about 20 miles above the point of confluence.

BEAT, in Music, a species of embellishment, written thus: , and played as follows, . Beat also means a signal given by the hand or foot in music to insure simultaneous performance—the hand or foot being raised on the unaccented, and lowered on the accented part of the bar.

BEAT OF DRUM, in military matters, is a signal or instruction conveyed by a particular mode of drum-beating. It is an audible semaphore, a telegraph that speaks to the ear instead of the eye. There are many varieties, known by the names of the general, the reveillé, the assembly, the foot-march, the grenadiers' march, the retreat, the taptoo or tattoo, the call to arms, the call to church, the pioneers' call, the sergeants' call, the drummers' call, the chamade, the rogue's march, the long roll, &c. Some of the same instructions or commands are also given by the bugle, and some by the trumpet.

BEATIFICATION is a solemn act in the Catholic Church, by which the pope, after scrutinising the life and services of a deceased person, pronounces him blessed. After this he may be worshipped in a specified portion of the church, and the act holds out the prospect of future canonisation, which entitles him to general worship in the church universal. B. was introduced in the 12th c. It may be regarded as an inferior degree of canonisation (q. v.).

BEATING AND WOUNDING, or simply *wounding*, is the name sometimes found in law-books for the offence of inflicting on another some dangerous hurt or wound; and it has been otherwise described as an aggravated species of Battery (q. v.). A still more aggravated and atrocious offence of this kind used to appear in the list of offences against the criminal law of England under the term MAYHEM, which was a violently depriving another of the use of a member proper for his defence, such as an arm, a leg, a finger, an eye, a fore-tooth, and some others; but it was laid down quaintly enough, that the loss of one of the jaw-teeth, the ear, or the nose, was no mayhem in common law, because these members can be of no use in fighting.

The offences to which we have referred—viz., *battery*, *beating and wounding*, and *mayhem*—can, however, be best considered under the important and well-known term ASSAULT, which is indeed often used to express the above injuries, and which is implied in them all. The above offences, it will have been observed, all involve an actual attack on and injury to the person of the party assaulted. But there may be an assault without such actual hurt. This is a *common assault*, and hence, in criminal law, assaults are distinguished by their being *common* or *aggravated*. A common assault has been defined as an attempt or offer to do a corporal hurt to another, as by striking at another with a stick or weapon, or without a weapon, though the party striking misses his aim. The principle is, that it is sufficient, in order to constitute such an offence, that there has been such an exhibition of a violent and offensive *animus* as to shew at once the intention, and the power, to commit it. So, drawing a sword or bayonet, or even holding up a fist in a menacing manner, throwing a bottle or glass with intent to wound or strike, presenting a gun at a person who is within the distance to which the gun will carry, pointing a pitchfork at a person who is within reach, or any other similar act, accompanied with such circumstances as denote at the time an intention, coupled with a present ability, of using actual violence against the person of another, will amount to an assault.—Russell on *Crimes and Misdemeanours*, vol. i. p. 750. It has even been laid down, that to present a pistol, purporting to be loaded, so near as to produce danger to life if the pistol had gone off, is an assault in point of law, although, in fact, the pistol was not loaded.

But no *words*, however provoking or irritating, can amount to an assault. On the other hand, the injury need not be effected directly with the hand of the person making the assault. Thus, there may be an assault by encouraging a dog to bite, by riding over a person with a horse, or by wilfully and violently driving a cart, &c., against the carriage of another person. Nor is it necessary that the assault should be immediate, as where a defendant threw a lighted squib into a market-place, which, being tossed from hand to hand by different persons, at last hit the plaintiff in the face, and put out his eye, it was adjudged that this was actionable. And the same has been held where a person wantonly pushed a drunken man against another, and thereby hurt him. A defendant put some cantharides into coffee, in order that a female might take it; and she did take it, and was made ill by it; and this was held to be an assault. It is also an assault, wilfully and of malice, to expose another to the inclemency of the weather; so is the taking indecent liberties with females without their consent, although they did not actually resist; and to such indecent liberties a very wide application has been given, even to the extent of holding a medical practitioner guilty of assault, who stripped a young girl of her clothes, on the pretence that he could not otherwise judge of her illness. Philanthropists and benevolent people will likewise be glad to be told, that not only does the striking that takes place at a *prize-fight* constitute an assault as between the combatants themselves, but all persons present in concert and co-operation may be punished as aiders and abettors. Again, an assault may be committed by unlawfully imprisoning or detaining the person of another; and by such detention is meant every confinement of the person, whether it be in a common prison or in a private house, or by a forcible detaining in the public streets. Numerous other cases could be stated, shewing how nicely and protectively the law on this subject has been elucidated; but the explanation we have given is sufficient for its popular illustration.

Generally, it may be laid down, that the essential thing is the *intention* with which the alleged act is done, so that no matter how violent or menacing the conduct of the accused may have appeared to be, nor even how serious the injury, if it can be shewn that the whole was unintentional or accidental and undesigned, there is no assault. It remains to be added on the subject of common assaults, that the party injured may proceed against the defendant summarily or by action or indictment for the same assault; but the court in which the action is brought will not compel him to make his election to pursue either the one or the other. Yet if the party has obtained a conviction before justices of the peace, this will be a bar to any other remedy, civil or criminal; and if the justices grant a certificate that it was not proved, or was trifling, this also, as must be quite apparent, will be a bar.

With respect to *aggravated* assaults, their special character arises from the great criminality of the

object intended to be effected. Thus, attempts to murder, or to do great bodily harm, to ravish, and to obstruct officers of the law in the execution of legal process, are all of the nature of aggravated assaults; as are also attempts to commit robbery, or any other felony. The remedy for an aggravated assault is usually by indictment, but justices of the peace may also, at least in the first instance, decide some cases. In certain cases, the punishment is regulated by recent statutes: thus, by the 24 and 25 Vict. cc. 96, 100, it is enacted that persons unlawfully and maliciously starving an apprentice or servant, whereby the life of such person shall be endangered, or the health injured, shall be guilty of a misdemeanour, and on conviction may be imprisoned, with or without hard labour, for any term not exceeding two years; and where the offence shall be against a young person under the age of 16 years, and shall amount in point of law to a felony, or to an attempt to commit a felony, or to an assault with intent to commit a felony, the guardians of the union or parish, or, where there are no guardians, the overseers of the parish, are authorised and required to prosecute, the costs of the prosecution being paid out of the common fund of such union or parish. Again, by an act of 24 and 25 Vict. c. 100, it is declared expedient to make further provisions for the punishment of aggravated assaults, and it is therefore enacted, that if any person shall unlawfully and maliciously inflict upon any other person, either with or without any weapon or instrument, any grievous bodily harm, or unlawfully and maliciously cut, stab, or wound any other person, every such offender shall be guilty of a misdemeanour, and being convicted thereof shall be liable to three years' penal servitude, or to be imprisoned, with or without hard labour, for a term of two years: provided, however, that nothing contained in the act shall be deemed or taken to repeal other enactments of the act, by which it is provided, that if any person shall unlawfully and maliciously, by any means, wound any person, so as thereby to endanger the life of such person, or so as thereby to inflict upon such person any grievous bodily harm, every such offender, being convicted thereof, shall be liable to be sentenced to penal servitude for life, or for the term of three years, or to be imprisoned, with or without hard labour, in the common jail or house of correction, for any term not exceeding two years; and, if a male, to be once, twice, or thrice publicly or privately whipped, in addition to such imprisonment, if the court shall think fit. The only other enactment that it may be necessary to notice is one in the same statute of 24 and 25 Vict. c. 96, which provides that any person convicted of any indecent assault, or of any assault occasioning actual bodily harm, shall be liable to be imprisoned for any term now warranted by law, with hard labour during the whole or part of such imprisonment.

In Scotland, the principle of the law of assault, and of its aggravations, is very much the same as that above stated. In the Scotch system, it is laid down that it is of the utmost importance in all cases of actual assault to ascertain who struck the first blow, and the party who receives it will be excused for retaliating, if he do not exceed the just and fair measure of resentment. There, too, the highest of all aggravations is the assault with intent to murder. It is also an aggravation that the assault has been committed in pursuance of an old grudge, and on a principle of revenge; where, also, the offence has been accompanied with an intent to compel a rise of wages, or to deter from working at a certain rate, or in pursuance of a combination entered into for these illegal purposes. Another aggravation of the offence in Scotland is its being committed by a child on its parent, by a husband on his wife, or by any person upon another within his own house, although the latter crime falls more strictly under the antiquated term of *Hamesucken* (q. v.). The remedy in Scotland is, as in England, by civil action of damages, and by a criminal prosecution, both being maintainable, and the latter usually at the suit of the Lord Advocate, as public prosecutor; but the private injured party may prosecute criminally should the Lord Advocate decline to do so. See, on the subject of this article generally, Russell *On Crimes and Misdemeanours*, in England, and Alison's *Principles of the Scotch Criminal Law*.

BEATING JUDGES, in the Scotch law, is the strange title of a strange offence, according to the enlightenment of the present age—namely, that of committing a personal assault on a judge. By the provisions of an old statute now in desuetude, an assault on a judge sitting in court is a capital offence.

BEATING THE BOUNDS is the popular expression in England for those periodical surveys or perambulations by which the ancient boundaries of parishes are preserved. The procedure, according to common custom, is in this wise: On Holy Thursday or Ascension Day, the clergyman of the parish, with the parochial officers and other parishioners, followed by the boys of the parish school, headed by their master, go in procession to the different parish boundaries, which boundaries the boys strike with peeled willow-wands that they bear in their hands, and hence the expression beating the bounds. The correct legal term is *Perambulation* (q. v.). See Brand's *Popular Antiquities*, vol. i. pp. 174, 175; Lyson's *Environs of London*, vol. ii. p. 146; Hone's *Every-day Book*, vol. i. p. 651; Steer's *Parish Law*, by Hodgson; and Toulmin Smith's *Parish Law*.

According to these and other old authorities, the beating was not confined to the above performance of the boys with their willow-wands; but where it was desired to preserve evidence of particular boundaries, the singular expedient was used of whipping the boys themselves on the spot, or one of them, who received a stated fee for the permitted castigation out of the parish funds—it being thought that the impression made on the memory of the whipped boy was calculated to have a beneficial effect on the preservation of his evidence. A similar ceremony appears anciently to have prevailed in Scotland, and for the same purpose. See Lord Stair's *Institutes of the Scotch Law*, book iv., title 43, s. 7, where it is stated that the boys were 'sharply whipped.'

BEATON, or BETHUNE, DAVID, Cardinal and Primate of Scotland, a zealous opponent of the Reformation in that country, descended from a celebrated French family, was a younger son of John Beaton of Balfour, Fifeshire. Born in 1494, he became, in October 1511, a student at the university of St Andrews, and afterwards studied theology and the canon and civil laws at Paris. Early entering the church, he was preferred by his uncle, James Beaton, Archbishop of Glasgow, to the rectory of Campsie, Stirlingshire. His tact and general abilities recommended him to the Duke of Albany, regent during the minority of James V., who, in 1519, appointed him resident for Scotland at the French court. In 1525, he took his seat in the Scots parliament as Abbot of Arbroath; his uncle, on being translated two years before to the archbishopric of St Andrews, having resigned to him that abbey, with the half of the rents. In 1528, B. was appointed Lord Privy Seal, and is said to have been the adviser of James V. in instituting the College of Justice or Court of Session in Scotland,

the idea of which was suggested by the constitution of the parliament of Paris. B. subsequently became Prothonotary Public, and was twice sent ambassador to France, to negotiate James's two marriages—first, with the French king's daughter, Princess Magdalene, who died six months after her nuptials; and secondly, with Mary, Duchess of Longueville, daughter of the Duke of Guise. The king's union with the latter he solemnised, in 1537, in the cathedral church of St Andrews. During his residence at the French court, he was admitted to all the privileges of a French citizen, and appointed by Francis I. Bishop of Mirepoix in Languedoc. After his return, he became coadjutor to his uncle in the see of St Andrews, and on 28th December 1538, on the recommendation of the king of France, was, by Pope Paul III., elevated to the dignity of a cardinal. On his uncle's death, in 1539, he succeeded him as Archbishop of St Andrews and Primate of Scotland, and soon commenced a furious persecution of the Reformers, already numerous and increasing. That he might be invested with supreme authority in all matters ecclesiastical, he obtained from the pope the appointment of *legatus a latere* in Scotland, and induced the king to institute a Court of Inquisition, to inquire after heretics in all parts of the kingdom. To maintain the French influence, and prevent all danger to the Roman Catholic Church in Scotland by a friendly connection with England, he contrived to frustrate a proposed meeting of King James with his uncle, Henry VIII., and even prevailed on the former to declare war against his royal relative. On the death of James, after the disastrous overthrow of the Scots at Solway Moss, December 14, 1542, B. produced a forged will of the late king, appointing himself, with three others, regents of the kingdom during the minority of the infant Queen Mary. The nobility, however, rejected the fictitious document, and elected the Earl of Arran regent, who then professed the reformed faith. The following month, B. was arrested and imprisoned, accused, among other charges, of a design to introduce French troops into Scotland, in order to stop the negotiations then in progress with Henry of England for a marriage between the young Prince of Wales, afterwards Edward VI., and the infant Queen of Scots. He was soon after liberated, and reconciled to the regent, whom he induced to abandon the English interest, and publicly to abjure the reformed religion. On the young queen's coronation in 1543, B. was again admitted of the council, and appointed Chancellor. He now renewed his persecution of the Reformers; and, in January 1546, accompanied by the regent, he made a diocesan visitation of the counties under his jurisdiction, and punished with the utmost severity all the Protestants he could find. At Perth, a number of persons, accused of heresy, were banished the city, others were imprisoned; three men were cruelly hanged, and one woman drowned, by his directions. During a Provincial Council of the clergy held at Edinburgh, at which he presided, he caused the celebrated evangelical preacher, George Wishart, to be apprehended, and conveyed to the castle of St Andrews, where he was burnt at the stake, B. and other prelates witnessing his sufferings from a window. A conspiracy having been formed against him, at the head of which were Norman Leslie and his brother, B. was assassinated in his own castle of St Andrews, 29th May 1546. Though endowed with great talents, B. possessed little learning. He is said, however, to have written *Memoirs of his Own Embassies;* a treatise on *St Peter's Supremacy;* and *Letters to Several Persons*, of which Dempster observes there are several copies extant in the Imperial Library at Paris. He cruel, and intolerant, he was also licentious extreme. He had six natural children, three and three daughters—the latter married into of distinction. One of his sons became a Prot His death was scarcely lamented by any pa the state.

BEATTIE, JAMES, poet and moral was born, 25th October 1735, at L Kincardineshire, Scotland. He studied College, Aberdeen, where he acquired tion as a classical scholar. In 1758, he wa one of the masters of the grammar-school city, and in 1760, Professor of Moral Philo Marischal College. Ten years afterwa B.'s famous *Essay on Truth*, which extravagant success. It was in to Hume, whose penetrating its way into all the enlightened and alarmed the friends of revealed Reid and Campbell had previously refute the scepticism of the great his the opinion of many, too deferentially. B. wh nature was poetically vehement, and wi was consequently very ardent, and more violently, if not more pow predecessors. The author hims the popularity of his essay. He George III., and solicited by d English Church to take orders; were also promised, which, howev he mously refused, shrinking with delicacy fro anything which might give his chance of saying that he had writt religion for hire. It was thought fo had demonstrated 'the immutability o exposed the 'sophistry of scepticism;' judge from the neglect which has treatise during the last fifty years, ments had been overestimated. B. was in logical acumen and in extent of erudition, but his poetical fancy, pure and pious intentions, recommended multitudes. In 1771, appeared the *The Minstrel*, and in 1774, the se is a delightful poem. Time it, for it still retains the fres overflows with a sweet poet in picturesque descriptions, has a quiet fulness of melody. yet fervent spirit beats in every line. describes 'the progress of a poetical a rude age, from the first dawn reason, till that period at which he capable of appearing in the work B. intended to have added a third stances hindered him. In 1776, he of essays on *Poetry, Music*, &c.; *tions Moral and Critical;* in 1786, *the Christian Religion briefly and pla* in 1790—1793, *The Elements of Moral* of which works are writt a clear style, and with a high a tion of beautiful and good. He A His life has been written by Forbes.

BEAUCAIRE, a well-built France, situated on the right b in the department of Gard, opp which it is connected by a bridge. Pop., exclusive of gar harbour is commodious for it by a canal communica rranean, and avoiding mouths of the Rhone.

its great fair, established, it is said, as early as the 12th c. It is held annually, beginning 22d July, and lasting six days. In former times, when this fair was free from duties, it was attended by merchants and manufacturers from almost all parts of Europe, from the Levant, and even from Persia and Armenia; and as the small town could not contain the vast concourse of traders, thousands of wooden huts and of tents were erected in the neighbouring valley. But the numerous imposts demanded since 1632, foreign wars, and the competition of Marseille, Lyon, and other large places, reduced the traffic of B., which sank still lower in the days of the Revolution. The fair, however, is still held in much repute, the number attending it being estimated at 50,000, and the amount of property changing hands at £180,000. The chief articles of commerce are silks, wines, oil, almonds, and other fruits, spices, drugs, leather, wool, and cotton. B. appears to have been known in ancient times as Ugernum, which, in the 7th c., was a place of importance in a military point of view.

BEAUCHAMP, Alphonse de, a French historian and publicist, born at Monaco, 1767; died in Paris, June 4, 1832. He received his education in Paris, and entered the Sardinian military service. At the outbreak of the war with France, he refused to bear arms against his country, and obtained his discharge; but being suspected of treasonable designs, he was imprisoned for some months. After his liberation, he returned to Paris, where he took part against Robespierre; and on the establishment of the Directory, obtained a situation in the office of the minister of police, and had the surveillance of the press. Here he commenced his *Histoire de la Vendée et des Chouans* (3 vols., Par. 1806; 4th ed., 1820), for which Fouché supplied the materials. As this work displeased the Emperor, B. was banished to Rheims, but was recalled in 1811, and again received a subordinate appointment (on condition that he should publish nothing concerning his political contemporaries), which he lost in 1814. Under the Restoration, he received a pension (1820), and wrote for the *Moniteur*, the *Gazette de France*, and the *Biographie des Hommes Vivants*, edited by Michaud. The numerous historical writings of B. are interesting, but bear the impress of party-spirit; but in his *Histoire du Brésil* (Par. 1815), and *Histoire de la Conquête du Pérou* (Par. 1807), he found no opportunity of expressing his political partialities. Among his other works may be mentioned the *Histoire de la Campagne de* 1814—1815 (2 vols., Par. 1818), the *Histoire de la Révolution du Piemont*, directed against De la Rosa (Par. 1823), and *Vie de Louis XVIII.* (Par. 1825). After the July revolution, he was employed on several legitimist journals; and the supposititious *Mémoires* of Fouché (4 vols., Par. 1828–1829) have, with good reason, been ascribed to Beauchamp.

BEAUFORT, an inland district of the west division of the Cape Colony, divided into 9 field-cornetcies. It is chiefly used for pasturage, its oxen being, in seasons of abundant rain, decidedly the fattest in the colony. Its area is about 13,050 square miles; and its population is nearly 6000. Its capital, of the same name, is on the Gamka, being 363 miles to the east of Cape Town, and 144 to the west of Graaffreinet.

BEAUFORT, Cardinal, and Bishop of Winchester (born about 1370), was a natural son of John of Gaunt, Duke of Lancaster, and was half-brother to King Henry IV. He was educated in England and Germany, and in 1404 became Bishop of Winchester. He repeatedly filled the office of Lord Chancellor, and was involved in all the most important political movements of his times. He was present at the Council of Constance, and voted for the election of Pope Martin V., by whom he was subsequently made a cardinal. When the cardinal's nephew, Henry V. of England, proposed to levy a new impost on the clergy, in order to raise money for carrying on the war against France, B. was the chief opponent of the measure; but nevertheless he lent the monarch, out of his own private purse, £28,000– an almost incredibly large sum in those days, and one which justifies the belief that he was the wealthiest subject of his time in all England. His service in this affair was soon recognised by the pope, who sent him as legate into Germany, there to organise a crusade against the followers of John Huss. This undertaking failed; and the cardinal, having expended, in levying an English army against France, the moneys granted from Rome for other purposes, now fell under papal displeasure. In 1431, B. conducted the young king, Henry VI., to France, to be crowned in Paris as king of France and England. Here he also endeavoured, but vainly, to reconcile the Duke of Bedford, Regent of France, with the offended Duke of Burgundy. Cardinal B. died at Winchester in 1447. His memory is stained by his suspected participation in the murder of his great political rival, the Duke of Gloucester, who headed the lay opposition to the despotism of ecclesiastical statesmen; and by the fact, that he presided over the tribunal which sentenced the Maid of Orleans to perish at the stake.

BEAUGENCY, an ancient town of France, in the department Loiret, and situated on the right bank of the Loire, 15 miles south-west of Orleans. It was at one time surrounded by walls, flanked with towers and bastions, and defended by a strong castle, now ruined. In the history of the wars of France, B. occupies a conspicuous place. It was successively in the hands of the Huns, Saxons, Normans, and English, but it sustained most damage during the religious wars of the 16th c. B. manufactures woollens, leather, &c., and has a trade in wine, wool, and corn. Pop. (1872) 3882.

BEAUHARNAIS, Alexandre Vicomte de, born 1760, in the island of Martinique, served, under Marshal Rochambeau, in the American War of Independence. Afterwards, he went to France, but though well received by the French court, he embraced the popular cause. Elected deputy to the States-general by the nobility and the justiciary authorities of Blois, he was among the first of his order to fraternise with the *Tiers Etat*, or democratic party. On the night of August 4, 1789, he voted for the abolition of all privileges, and the political equality of all citizens. As a reward for his constancy to the cause of liberty, he was named Secretary of the National Assembly, and subsequently member of the military committee, but lost his popularity considerably by venturing to praise and defend the conduct of General Bouillé in the sanguinary suppression of the insurrection at Nancy. The manner in which he received the news of the flight of Louis XVI. exhibits a curious mixture of contempt and dignity. 'Gentlemen,' said he to the Assembly over which he presided, 'the king has just gone off; let us pass to the order of the day.' In 1793, he declined the office of Minister at War, and tendered his resignation as general of the Army of the Rhine, because it had been determined to exclude the nobility from the service. During the Reign of Terror, his enemies revived the report that he had participated in the surrender of Mentz, because he had remained idle with his troops for 15 days. In consequence of this accusation, he was called from his country residence

at Fertè-Imbault to Paris, where he was tried and sentenced to death by the revolutionary tribunal. He submitted to his fate with firmness, and died on the scaffold, July 23, 1794, aged 34 years. His widow, Josephine, married Napoleon Bonaparte, who adopted Eugène and Hortensia, son and daughter of Beauharnais. Hortensia was married to Louis Bonaparte, king of Holland, and became the mother of Napoleon III., Emperor of the French.

BEAUHARNAIS, EUGÈNE DE, Viceroy of Italy during the reign of Napoleon I., and afterwards Duke of Leuchtenberg, and Prince of Eichstadt, was born September 3, 1781, and was the son of the Viscount Beauharnais. After his mother's marriage with Bonaparte, he accompanied him in his campaigns in Italy, and in the expedition to Egypt. He rapidly rose to the highest military rank; and in 1805, after the erection of the imperial throne, he was made a Prince of France and Viceroy of Italy. In 1806, he married the Princess Amalie Augusta of Bavaria, and not long afterwards was created Prince of Venice, and declared by Napoleon his adoptive son, and heir of the kingdom of Italy. Although his political power was much limited, he conducted himself in Italy with much prudence, energy, and moderation, and in all the various scenes of his life maintained an honourable and virtuous character. It is to be regretted, however, that he considered himself so entirely a vassal of Napoleon, and bound to carry out the often harsh decrees of the latter in regard to Italy. His military talents were great, and were displayed particularly in the Italian campaigns, in the wars against Austria, and in the retreat from Moscow, in which the preservation of the French army from total destruction was very much to be ascribed to the skill and resolution of the viceroy and of Ney. The victory of Lützen was decided by his conduct in that battle. Napoleon sent him from Dresden to Italy, which he ably defended, even after Austria had joined the coalition, and Murat had deserted the cause of the French Empire. After the fall of Napoleon, he entered into a convention with Count Bellegarde. In the affairs of the Hundred Days, he took no part; and in the treaty of Fontainebleau and Congress of Vienna, he was allowed to retain his possessions in the March of Ancona; and large sums were granted to him in compensation for his other Italian possessions, with which he purchased from his father-in-law the landgraviate of Leuchtenberg and principality of Eichstadt, and took his place as Duke of Leuchtenberg among the nobles of Bavaria. He died at Munich on the 21st February 1824.—His eldest son, Charles Augustus Napoleon, Duke of Leuchtenberg, married the Queen Donna Maria of Portugal on the 25th January 1835, but died on the 25th of March in the same year.—Another son, Max Eugène Joseph Napoleon, who succeeded his brother as Duke of Leuchtenberg, married the Grand Duchess Maria Nikolajewna, a daughter of the Emperor Nicholas of Russia; and his children bear the name of Romanowski, and are ranked among the members of the Russian imperial family. He died 1st November 1852, of disease of the lungs, consequent upon a scientific tour in the Ural. He was a zealous mineralogist, and left large collections, which are preserved at St Petersburg.

BEAUMARCHAIS, PIERRE AUGUSTIN CARON DE, a French poet, born in Paris, January 24, 1732; died May 17, 1799, was the son of a watchmaker, and was brought up to his father's trade. He soon displayed a remarkable taste for music, attained proficiency as a player on the harp and the guitar, and was appointed music-master to the daughters of Louis XV. This was the beginning of his course of good-fortune. He acquired considerable property by marriage, and to dignify the somewhat ambiguous position in which his calling placed him, he devoted his talents to literature. His first play, *Eugenie* (1767), was successful, and was followed by *Les Deux Amis* (1770). Having become involved in lawsuits with Lablache and Gützman, he revenged himself on the latter—who was a member of the so-called *Parlament Maupeou*—by publishing his famous *Mémoires* (Paris, 1774), which united the bitterest satire with the sharpest logic, and gained for him a reputation that made even Voltaire uneasy, who could not bear a rival in his own department. Despite his wit, however, he lost his suit. His fame now rests on his two operas, *Le Barbier de Seville* (1775), and *Le Mariage de Figaro*. Of his later works, we may mention *Mes Six Epoques*, in which he describes the perils through which he had passed in the first period of the Revolution. During the American War of Independence, he entered into a speculation for supplying arms, &c., by which he realised a considerable profit, but was a great loser by his expensive edition of Voltaire's works, and other speculations. The desire of gain and love of distinction were the leading motives which actuated Beaumarchais. His literary merits have been differently estimated. The most judicious critic of his writings and character is M. de Loménie, whose *B. and his Times* is full of interesting literary anecdote. An edition of B. was published at Paris in 1809.

BEAUMARIS, a seaport and chief town of Anglesea, North Wales, is situated on the west side of the picturesque Bay of B., near the north entrance to the Menai Strait, 3 miles north of Bangor, and 239 miles north-west of London. B. has the ivy-covered remains of a castle, erected by Edward I., and a free grammar-school, and is a favourite sea-bathing resort. The bay is a safe anchorage in stormy weather. B. unites with Amlwch, Holyhead, and Llangefin in sending one member to parliament. It exports copper and other ores, slates, marble, &c. Pop. (1871) 2291. The vessels which entered this port in 1872 numbered 1507, of tonnage 261,590; which cleared it, 901, of 287,443 tons.

BEAUMONT, [illegible] most FLETCHER, J[illegible], poets writers were so closely asso[illegible] labours, that their names [illegible] united.—Francis Be[illegible] Francis Beaumont, [illegible] mon Pleas, was born [illegible] in 1586, ten [illegible]; ten years b[illegible] became a g[illegible] (now Pembroke [illegible]) a member of the Inner Temple. [illegible] after, he published certain t[illegible] When about nineteen years [illegible] friend of Ben Jonson, and w[illegible] verses to some of his dr[illegible] attracted to its service[illegible] wit of the time, he [illegible] Fletcher, and drawn [illegible] same house till B.'s [illegible] Ursula, daughter [illegible] Sundridge, in K[illegible] He died at the [illegible] in Westminster [illegible] in the blood of the [illegible] of B.'s immediate fa[illegible] brother of the d[illegible] said by the c[illegible] rhyme couplet.

John Fletcher was [illegible]

clergyman, and appears to have inherited many of the honours of the church. He was for some time incumbent of Rye, in Sussex; thereafter, he was appointed Dean of Peterborough, and is said to have attended Queen Mary on the scaffold, and to have embittered her last hours with irrelevant exhortation. On his elevation to the see of London, he married a second time, and thereby procured the disfavour of the Virgin Queen. He died shortly after, some maintaining, of a queen's frown, others, of the immoderate use of tobacco. John F. entered Bennet College, Cambridge, on the 15th October 1591, where he acquired some reputation for classical erudition. It is uncertain how long he remained at the university, or whether he took a degree. The *Woman-hater*, produced in 1606—1607, is the earliest play of his which is known to exist. It is not known precisely in what circumstances F. passed his life. He asserts his independence in some verses introductory to *The Faithful Shepherdess*, published about 1610, yet he wrote more rapidly than most men then writing for bread. The last four years of his life produced eleven new plays—a swiftness surpassing that of Shakspeare himself. Tarrying in London, it is said, for a suit of new clothes, he caught the plague, and died. His death occurred in 1625, and he was buried in the church of St Saviour's. F. also could boast of poetic descent and connection. Dr Giles Fletcher, the bishop's younger brother, has been called 'an excellent poet;' and two sons of his, Giles and Phineas, distinguished themselves by their verses. The one wrote *Christ's Victory and Triumph;* the other, *The Purple Island.*

The works of B. and F. comprise in all fifty-two plays, a masque, and several minor poems; but it is difficult to allocate, in any satisfactory manner, the authorship of these. F., being the longer lived and more prolific writer, of course contributed the largest share. Rowley assisted F. in *The Maid of the Mill.* Some critics think that the hand of Shakspeare may be detected in *The Two Noble Kinsmen*, and not without some show of reason. There is a tone of music and a step of thunder in some of the passages to which no parallel could be found in any of the companion-dramas. Two plays left unfinished at F.'s death were completed by Shirley. Out of the fifty-two plays, B. is supposed to have had a share in the composition of seventeen, and only three out of that small number were, during F.'s lifetime, published as joint productions. Two of these—*Philaster*, and *The Maid's Tragedy*—are, with the exception of the great passages in *The Two Noble Kinsmen*, the glory of the collection. The question has been often discussed, why these plays are called by the name of B. and F., thus giving precedence to the younger and less voluminous writer. Mr Dyce thinks, that of the three plays published as joint productions during F.'s life, B. had either the greater share, or that, through feelings of natural courtesy, F. placed the name of his deceased associate before his own, and that future editors naturally followed the arrangement which they found to their hand. Mr Darling is inclined to give no reason at all, and ascribes the whole thing to accident. From all that can be gathered, it would appear that B. possessed the deeper and more thoughtful genius; F., the gayer and more idyllic. There is a strength as of granite rock in *The Maid's Tragedy;* there is a glad exuberant music, and a May-morning light and freshness, in *The Faithful Shepherdess*, which Milton did not disdain to accept as a model in the lyrical portions of *Comus*, and of which the *Endymion* of Keats is but an echo. In these plays, B. and F. are the cleverest, gayest gentlemen. They never sound the deep sea of passion; they disport themselves, dolphin-like, on its surface. They have no power of serious characterisation, and their numerous creations are seldom consistent; but they say the most clever, pleasant, and glancing things. Morally, little can be said in their praise. No audience of the present day could sit out the representation of their purest plays. Some of the impurest are almost beyond conception, yet there is always an air of good-breeding about them, and the filth is handled in the most gentlemanly manner. It was a great intellectual period in which B. and F. lived; but Shakspeare stands above them and the rest of that dramatic brotherhood like Mont Blanc above the summits of the Lower Alps—conspicuous not only from his altitude, but from his purity.

BEAUMONT, Gustave de, a distinguished French publicist, born February 6, 1802, at Beaumont-la-Chartre, in the department of Sarthe. He studied law, and was made procurator-substitute in the superior tribunal of the Seine, but lost this office after the July Revolution. In 1831, B. and Tocqueville were commissioned by the French government to study the prison-discipline of America. When B. returned to Paris, he received a place under government, but was soon deposed, as he refused to conduct the prosecution in the scandalous process against the Baroness de Feuchères. In 1840, he was elected deputy for the department Sarthe, and distinguished himself, as a member of the Opposition, by his information and readiness on all political questions. After the February Revolution, 1848, he was returned as member of the Legislative Assembly, and here maintained the character of a sincere but moderate republican. After the 2d December 1851, he was arrested and imprisoned for some time in the fortress of Mont Valérien. On regaining his liberty, he retired to his patrimonial estate. He died in 1866. B. was the grandson of Lafayette, and in 1836, married his cousin, the daughter of Georges Lafayette. The writings on which B's reputation is founded are—*Note sur le Système Pénitentiare* (1831), *Du Système Pénitentiare aux Etats-unis et de son Application en France* (2 vols., 1832; partly by Tocqueville), *Marie ou l'Esclavage aux Etats-Unis* (2 vols., 1835), and *L'Irlande, Sociale, Politique, et Religieuse* (2 vols., 1839).—Beaumont-Vassy, Edouard Vicomte de, a relation of the former, has acquired a reputation as the writer of a romance, *Une Marquise d'autrefois* (1838), and some historical works, especially a *History of the European States since the Congress of Vienna* (vols. 1–6, Par. 1843—1853).

BEAUMONT (Elie de), Jean Baptiste, late Chief Engineer and Professor of Geology in the School of Mines at Paris, and in the *Collège de France*, was born at Canon in 1798. He was distinguished not merely as a practical geological investigator, but also as a clear and acute speculator. The prevailing theory regarding the elevation of mountain systems was elaborated chiefly by him. His views as to the separate periods of elevation were published in several treatises. He was occupied for 23 years, in conjunction with Dufrénoy, in the preparation of a geological map of France, and its accompanying text. Among his writings are: *Coup d'Œil sur les Mines*, 1824; *Observations Géologiques sur les Différentes Formations dans le Système des Vosges*, 1829; *Recherches sur quelques-unes des Révolutions de la Surface du Globe*, 1835; and *Voyage Métallurgique en Angleterre* (2d ed., 1837—1839). He died in 1874.

BEAUNE, capital of an arrondissement in the French department Côte d'Or, formerly included in the Duchy of Burgundy, is situated in a pleasant district on the river Bouzoise, about 23 miles

south-south-west of Dijon. The town is well built; has a fine parish church, Notre Dame, founded in 976 by Duke Henri of Burgundy; and a splendid hospital, founded in 1443 by Nicholas Rollin, Chancellor of Philip, Duke of Burgundy. There are several manufactories of serges, woollen cloth, and cutlery. A considerable trade is carried on in Burgundy and Champagne wines. B. gives its name to one of the best of the Burgundy wines. Pop. (1872) 10,100.

BEAUNE, FLORIMOND, a distinguished mathematician, and friend of Descartes, was born in 1601, at Blois, in France, where he died in 1652. His labours and discoveries contributed greatly to the improvement of the modern analytical geometry first introduced by Descartes. Algebra was also enriched by B.'s shewing that, in equations to the fourth degree, the limits of positive roots might be found from the coefficients. B. may be regarded as the proper founder of the Integral Calculus, as he first endeavoured to deduce the nature of curved lines from the properties of their tangents. The so-called 'B.'s Problem' (which has been completely solved only by Jean Bernouilli), still given in the Integral Calculus, was for his time new and remarkable, it turns also on the determination of the nature of a curved line from a property of its tangent. The only work of his we possess is *De Æquationum Limitibus Opuscula duo, et Notæ Brevs.*

BEAUTY. See ÆSTHETICS, ART.

BEAUVAIS, an important manufacturing French town, capital of the department Oise. It is situated in the valley of the Thérain (a tributary to the Oise), about 41 miles north-north-west of Paris, and surrounded by rising woodlands. Formerly, B. was included in the old province, Ile de France. It is now the seat of government for the department, and the residence of a bishop, and contains a literary and economical society, a public library, a museum, &c. Among its several fine buildings, the most noteworthy is its uncompleted cathedral, the choir of which is the loftiest as well as one of the finest specimens of Gothic in France. The manufactures of B. include woollen cloths, shawls, carpets, Gobelin tapestry, &c. Pop. (1872) 13,532. B. is an ancient town. It was included in the country of the powerful *Bellovaci*, in *Gallia Belgica*, and was known by the Romans as *Cæsaromagus*, afterwards as *Bellovacum*. In the middle ages, it was styled *Belvacum*. In 850, and at other times, B. was desolated by the Normans. The *Jacquerie*, or Peasants' War, broke out in the neighbourhood of B., March 21, 1358. In 1443, B. was besieged by the English, who were repulsed by the heroic self-sacrifice of Jean Lignière. Again, in 1472, it was besieged by Charles the Bold of Burgundy, with an army of 80,000 men, when the women of B., under the leadership of the heroine Jeanne Lainé, surnamed La Hachette for her daring, displayed remarkable valour. The standard which the Burgundians had planted on the wall was torn down by Jeanne Lainé, and borne off by her in triumph. The banner is preserved in the town hall, and a procession, in which it is carried by young girls, annually commemorates the heroic deed. B. is the birthplace of the learned Dominican Vincent de Beauvais (Vincentius Bellovacensis).

BEAVER (*Castor Fiber*), a quadruped of the order *Glires*, or *Rodentia* (q. v.), valued for its fur, and for the peculiar substance called *Castoreum* (q. v.), which it yields, and also much noted for its instincts. Some naturalists regard the American B. as distinct from that of Europe and Asia; but the differences observable either in external or anatomical characters are very inconsiderable; and the opinion that a great difference exists in instincts and habits, appears to have been too hastily adopted. If there is only one species of B., it is very widely distributed in the northern regions of the world, reaching in America almost as far south as the Gulf of Mexico. It once existed in the British islands, where, however, it has long been extinct; and it has become rare in Europe, in many parts of which it was once common. It has become rare also in the United States, disappearing before man; but is nowhere so abundant as in that wide region of lakes and rivers which lies to the north and west of the settled parts of North America. Considerable numbers of beavers are found on the banks of the Obi and other rivers of Siberia, and in Kamtchatka.

The incisors or cutting teeth of the B. are remarkably strong, and exhibit in the highest degree the distinctive character of the order to which it belongs —the front of hard enamel, which in the B. is of a bright orange colour; the back of the tooth formed of a softer substance, more easily worn down, so

Beaver.

that a sharp, chisel-like edge is always preserved; the bulbs being also persistent, so that the teeth are continually growing, as by their employment in gnawing wood, they are continually being worn away. There are four flat molar teeth (or grinders) on each side in each jaw. Each foot has five toes: those of the fore-feet are short, and not connected by a web; those of the hind-feet are long, spreading out like the toes of a goose, and webbed to the nails. In accordance with this remarkable peculiarity, the B., in swimming, makes use of the hind-feet alone, the fore-feet remaining motionless and close to the body. Another character, to which nothing similar appears in any other rodent, is the large, horizontally flattened tail, which, except at the root, is not covered with hair, like the rest of the body, but with scales. The caudal vertebræ, however, do not exhibit a flattened form.

The B. is usually at least two feet
the nose to the root of the tail: the

The food of the B. consists of the bark of trees and shrubs (birch, poplar, willow, &c.), and of the roots of water-lilies (*Nuphar luteum*) and other aquatic plants. In summer, it eats also berries, leaves, and various kinds of herbage. There is reason to think that it never, as has been supposed, kills or eats fish. Like some other rodents, it lays up stores of provisions for winter; but these, in the case of the B., consist chiefly of bark, or of branches, and even trunks of trees. Its extraordinary powers of gnawing are exerted to cut down trees of several inches in diameter, both for food, and for the construction of those houses and dams which have rendered it so much an object of admiration to mankind. A tree of 18 inches in diameter has been found thus cut down by beavers, although smaller ones are usually preferred; and when a tree of this size is cut, the branches only, and not the trunk, are employed in the architectural operations of the animals. These operations are very wonderful, although the statement, at one time commonly made, that beavers drive stakes into the ground, has no foundation in fact; and some of the other particulars which passed current along with it, were equally fabulous. The houses or lodges of beavers are grouped together near the edge of the water, the mud being scraped away from the front, so that there may be a sufficient depth of water there to allow free egress, even during the most severe frost. The winter stores of the animals, consisting of piles or heaps of wood, are also always under water, at such a depth that they cannot be locked up in ice. When the depth of water is not sufficient, the beavers construct a dam across the stream, by the side of which the lodge is placed; the dam is sometimes as much as 300 yards in length, convex towards the current, and most convex in the strongest currents, sometimes extending on both sides beyond the natural channel of the stream. The materials of which it is composed are sticks, roots, and branches, with stones, moss, grasses, and mud, strangely commingled, but in such a manner that the structure becomes absolutely water-tight. Branches of which the bark has been used for food, or taken off for winter provender, are very generally employed for building purposes. In their building, beavers interlace small branches with each other and with the larger; and a B. kept in confinement has been known to manifest this instinct, by interlacing branches with the bars of its cage, whilst it also filled the interstices with carrots, and other vegetables, given it for food, nicely bitten to the proper size, and packed in snow, to protect itself from the cold. B. dams are built with the sides inclining towards one another, so that although ten or twelve feet wide at bottom, they have a narrow top. The dams and houses are annually repaired, before winter comes on, the work being performed by night. 'In places,' says Hearne, 'which have been long frequented by beavers undisturbed, their dams, by frequent repairing, become a solid bank, capable of resisting a great force, both of water and ice; and as the willow, poplar, and birch generally take root and shoot up, they by degrees form a kind of regular planted hedge, which I have seen in some places so tall that birds have built their nests among the branches.' A broad ditch is often dug all around the lodge, so deep that it cannot freeze to the bottom, and into it the beavers make the holes by which they go out and bring their food. The larger lodges are in the interior, about seven feet in diameter, and between two and three feet high. The top is formed of branches of trees, matted with mud, grass, moss, &c. The walls are very thick, and the whole structure not only secures much warmth, but is a sufficient protection from wolves, wolverines, and other beasts of prey. Different apartments have often one common roof, but they have usually no internal communication. The sleeping-places of the animals are around the wall of their lodge, the centre being left free; they are formed merely of a little grass or tender bark of trees. A single house seldom contains more than ten or twelve beavers, but many such families are often congregated in one place. Beavers, both in a wild state and in confinement, are scrupulously cleanly in their habits.

Beavers often sit on the hind-feet and tail, and eat in this posture, holding up the food in their fore-paws. They also walk on the hind-feet, with support of the tail, when they carry materials to their buildings, except branches, which are dragged. They have considerable power in the tail, and not unfrequently flap it, which has given rise to an opinion, perhaps not altogether erroneous, that they use their tails for plastering their buildings, or beating and adjusting the mud which is employed in them.

Beavers do not usually eat in their lodges, but in holes or burrows in the bank of the river, the entrance to which is from beneath the water, and which thence proceed obliquely upwards, often to a distance of many feet. To these holes the beavers also flee when their lodge is broken up; and it is therefore a common practice of the B. hunters to break up the B. lodges, that they may take the animals in their holes or vaults. Beavers are also taken by nets and traps.

It is chiefly in winter that beavers congregate together. During summer, they wander about a little. The young are generally produced in April or May, from two to seven at a birth. Their eyes are open when they are born.

Single beavers are frequently met with, which live apart from all others of their species. All of these are males, which, it is supposed, have been conquered and driven away by others of their sex.

In the parts of North America where beavers have now become rare, they live mostly in burrows in the river-banks, like those which are still found in Europe. Circumstances prevent them from following out their gregarious tendencies. That the beavers of Europe and Asia construct lodges and dams, when they have opportunity of congregating in sufficient numbers, appears to be no less certain than that those of America do so.

Large glandular pouches, two in number, closely connected with the organs of reproduction, contain the substance called *Castoreum* (q. v.). Its uses in the animal economy are by no means well known; they are probably analogous to those of musk, civet, &c.; but its peculiar pungent odour is so attractive to beavers, that use is made of it as a bait for B. traps.

The B. is very easily tamed; but no wooden cage will keep one confined. Except in the extraordinary building instincts already noticed, the animal exhibits no remarkable sagacity.— The use of the B.'s fur for making hats is well known. See HAT. An act of the English parliament, in 1638, prohibiting the use of any other material for hat-making, contributed to the rapid diminution of the number of beavers in the parts of North America from which their skins were then obtained. During great part of the 18th, and the earlier part of the 19th c., the number of B. skins annually exported from America appears to have been not less than 200,000. It is now greatly diminished, but is still large. The flesh of the B. is much esteemed as an article of food by trappers and others who frequent the fur-countries, but it is very oily.

Fossil remains of beavers, apparently of the same species with that now existing, are found in the

deposits referred by geologists to the pliocene and pleistocene periods. Other remains are also found of a much larger animal of the B. kind, which must have existed in Europe and Asia along with the present species, but which seems to have become extinct before the historic period. They were different, however, not merely in size, but in other particulars so important, that Owen has constituted for the 'great B.' a distinct genus, *Trogontherium* (Gr., a chewing or gnawing beast).

Of existing animals, the most closely allied to the B. is the *Coypu* (q. v.), sometimes called the Chilian B. (*Myopotamus Coypus*), which yields the fur called *Racoonda* (q. v.).

BEA'VER. See HELMET.

BEA'VER WOOD. See MAGNOLIA.

BEBEE'RINE is one of the alkaloids, and is obtained from the greenheart bark or *bebeeru* of Demerara. It is used in medicine in place of quinine, which it resembles in properties, though it is not so powerful in its action as a tonic and febrifuge. The condition in which it is generally sent into market is as the sulphate of B., occurring in shining scales of a pretty brown colour, and soluble in water.

BEBEE'RU, BEEBEE'RU, or BIBI'RI. See GREENHEART.

BECCAFI'CO (*Sylvia hortensis*, or *Curruca hortensis*), a little bird of the family of the *Sylviadæ*, or Warblers (q. v.), sometimes called the Pettychaps, and sometimes the Garden Warbler, rather rare in Britain, but abundant in some of the more southern parts of Europe, and in great demand for the table in Italy, its flesh being regarded as of peculiar delicacy. It is a mere summer bird of passage, however, not only in Britain, but even in the south of Europe. The upper parts are mostly of a brown colour, the lower parts whitish. It is a bird of very pleasing song. B. is an Italian name, and is sometimes extended to other birds of the same family used for the table.

BECCAMOSCHI'NO (*Sylvia cisti'cola*), a little bird of the family of the Warblers, found in Italy, and remarkable for its nest, which resembles that of the tailor-birds, being usually placed in a bush of lengthened herbage, the leaves and stalks drawn together over it, and a flooring formed for it by leaves curved across below, and sewed together generally with some kind of vegetable fibres.

BECCARI'A, CESARE BONESANA, a political and philanthropic writer, was born at Milan 1735 or 1738. The opinions of the French encyclopædists, especially those of Montesquieu, had the greatest influence in the formation of his principles and sentiments. The work which most favourably exhibits the character and genius of B. is his *Trattato dei Delitti e delle Pene* (Treatise on Crimes and Punishments), first published in 1764, in which he argues against the severities and abuses of criminal law, especially capital punishment and torture. The work was extremely popular, and was translated into several European languages. It is marked by eloquence, sensibility, and lively power of imagination. Kant unfairly accuses the author of an affected humanity, though it must be admitted that the German philosopher has exposed the invalidity of some of the arguments brought forward. On the whole, however, the work of B. is acknowledged to have done great good, and the subsequent reforms in the penal code of European nations have generally taken the direction he has pointed out. He was among the first to advocate the beneficial influence of education in lessening crime. This naturally brought upon him the hatred of the priesthood, who, according to their usual formula of persecution, accused him of impiety; but their malice was frustrated by the efforts of Count Firmian, the Austrian governor of Lombardy, a man of liberal and enlightened sentiments. In 1768, B. was appointed Professor of Political Philosophy at Milan, and achieved great success as a lecturer. He died of apoplexy in November 1793. In the course of his life he published several works.

BEC-FIN, the common French name for different species of birds of the family of *Sylviadæ*, or Warblers (q. v.). It is sometimes to be met with in English books.

BÊCHE-DE-MER, or TREPANG, an article of luxury among the Chinese, consisting of the dried bodies of several species of *Holothuria* (q. v.), or Sea-cucumber, which are found in great abundance in the shallow waters of lagoons, and on reefs, from the south-eastern coasts of Asia to New Holland. The traffic in B. is very extensive, and the Malays catch the animals, and prepare them in large quantities for the Chinese market. They are usually about 8 or 9 inches long, but some are 2 feet in length, and 7 or 8 inches in girth. They are often found nearly buried in the coral sand, their feathered tentacula alone floating above it. The larger ones are sometimes speared in shallow water; but most of them are taken by divers in depths of from 3 to 5 fathoms. An expert diver will bring up eight or ten at a time. They are split down one side, boiled, pressed flat with stones, dried in the sun, and afterwards in smoke, and packed in bags, in which state they are bought by the Chinese, and conveyed in junks to China. Fleets of Malay prahus are employed in the search for this curious production of the sea. Macassar is the great staple-place of the trade, and from it above 8000 cwt. of B. are annually sent to China, the price varying, according to the kind and quality, from thirty shillings to twenty guineas per cwt. There is also a considerable export of B. from Manilla. B. is extremely gelatinous, and is very much used by the Chinese as an ingredient in rich soups.

BECHER, JOHANN JOACHIM, author of the first theory of chemistry, was born at Speier in 1635. In his youth, he had many difficulties to contend with, but his zeal and perseverance overcame them all. He acquired an extensive knowledge of medicine, physics, chemistry, and even politics, and in 1660, was made a member of the Imperial Council at Vienna. While residing in this city, he assisted in establishing several manufactures, and drew up the plan of an East Indian commercial society, but unfortunately he fell into disgrace, and had to leave the city. He next went to Mainz, and subsequently lived in Munich, Würzburg, Haarlem, and finally London, where he died in 1682. He had many enemies, and was accused—not altogether unjustly—of charlatanry. Nevertheless, he rendered important services to chemistry. His *Physica Subterranea* was the first attempt made to bring physics and chemistry into close relation; in these two he sought the causes of all the inorganic phenomena in the world. He at the same time began to construct a theory of chemistry, and also investigated the process of combustion. B. taught that every metal was composed of an earthy substance common to all metals; of a combustible principle also identical in all; and was differentiated from other metals only by the possession of a peculiar mercurial element; when a metal was heated, until it had changed its form, the mercurial substance was discharged, and nothing remained except metallic calx. Herein lies the first germ of Stahl's phlogistic theory, which obtained universal currency until the time of Lavoisier.

BECHUANS. See Betjuans.

BECKER, Gottfried Wilhelm, a German author, born at Leipsic in 1778, entered the university of that city with the view of studying medicine, and having taken his doctor's degree in 1801, settled there as a practising physician and a writer of medical works, several of which reached many editions. The wars of the period led him, however, to turn his attention to history and modern languages, and he became well known by his contributions to periodicals, his series of popular histories, and his translations from the English, French, and Italian. In 1833, B. entirely relinquished practising medicine, and devoting himself to literature, became a fertile and admired contributor to many of its more popular branches. He died at Leipsic, 17th January 1854. He published several attractive volumes of travels in his own country, peculiarly adapted to the young, among which we may instance his *Tour to the Harz, Sketches of Southern Germany*, &c. His historical writings, which are not less numerous, chiefly narrate the events of his own time. Amongst them we may particularise *Andreas Hofer, Egypt as it Now is, The Fate of Spain in Modern Times*, &c. In light literature, also, he was very successful as a translator. All his works have been published at Leipsic.

BECKER, John Philip, one of the most active Radical politicians of late years, was born, March 1809, at Frankenthal, in the Palatinate on the Rhine, and brought up as a brushmaker. The French revolution of July 1830 gave a political bias to his tendencies, and he took part in the political agitations of the day, in consequence of which he was imprisoned; but in 1833 he was released, and exerted himself warmly on behalf of his brothers in opinion. In 1837, he settled in Switzerland, taking a part in several Radical publications, and organising, in 1838 and 1845, volunteer corps. In the autumn of 1847, he was summoned to the military bureau at Berne, and being chosen adjutant of Ochsenbein's division, fought against the Sonderbund with acknowledged bravery. Upon the failure of Hecker's attempt to revolutionise Baden in 1848, B., who had organised troops for his support, returned to Switzerland, to plan an expedition of German and Swiss auxiliaries, to support the cause of freedom in Rome and Sicily. Their movements being frustrated, he led his troops in the summer of 1849 into the Palatinate and the Duchy of Baden, where a rising had taken place, and acted a prominent part in many engagements. Subsequently, he settled in Geneva, and engaged successfully in commerce. A history of the revolution of 1849, in Southern Germany, has been published by him and Esselen. B. is a man of strong and hardy frame, and for prudence and decision, ranks high among the leaders of the revolutionary party.

BECKER, Karl Ferdinand, born at Leipsic in 1804, may be named with Kiesewetter and Winterfeld as one of the best German writers on the history of music, and also as an excellent composer for the organ, as is proved by his trios and other compositions well adapted to the genius of the instrument. Among his works may be mentioned: a *Choral-book*, or collection of psalm and hymn tunes (Leipsic, 1844); *Choral Melodies* for Spitta's Psalter and Harp, 1841; a *Catalogue* of his musical library, one of the most ex ve in Germany; *On the Choral Collections o Christian Churches*, 1841; *The Choral C of the 16th and 17th Centuries*, 1847; *Composers of the 19th Century*, 1849.

BECKER, Karl Ferdinand, one distinguished German philologists, Liser, in the old electorate of Treves, in 1775. At first a teacher, he afterwards studied medicine, and ultimately settled as a practitioner at Offenbach. Here he educated his own children with such success that several families induced him to take charge of theirs, and thus his house was converted into an academy (1823), which he conducted till his death in 1849. This gave scope to his early predilection for linguistic studies, to which his scientific training led him to give a quite new direction. B. contemplates language as an *organism*, pervaded by strict logical laws. From this point of view, he wrote his *Deutsche Grammatik* (2d ed., 1842). He neglects too much the historical development of language, and thus, as might be expected, comes at times into conflict with the results of comparative philology; yet his work is valuable for its logical consequence, and for its leading idea of organism in language. Besides a *Schulgrammatik* (8th ed., 1862), which is an outline of his larger work, he published several other treatises on the German language.

BECKER, Wilhelm Adolf, a distinguished German author, was born at Dresden in 1796. Originally intended for commercial life, he soon abandoned a pursuit which he found uncongenial to his tastes, and devoted his time to the acquisition of learning. In 1816, he came to Leipsic, where he studied theology, and more particularly philology. In 1840, he travelled through Italy; and in 1842, was appointed Professor of Archæology at the university of Leipsic, where his prelections on the Latin authors were numerously attended. He died at Meissen, 30th September 1846. His lively fancy, aided by a thorough knowledge of the classic languages, enabled him to make quite a novel use of antiquity. In his *Charicles* (Leip. 1840), he ventured to reproduce the social life of old Greece; and in his *Gallus* (Leip. 1838), to give sketches of the Augustan age at Rome. The learning which he has contrived to stuff into his picturesque sentences is marvellous, not to speak of the quantity buried in his *excursus*, or disquisitions, which, in the English translation of the works by Metcalfe, are transferred from the text to the end of the volumes. Lockhart's *Valerius* is the only thing in English literature which corresponds to these compositions of the German author. B.'s treatise, *De Comicis Romanorum Fabulis* (Leip. 1837), is a valuable contribution to the history of Roman dramatic poetry. His most important work, in a scholastic point of view, is his *Handbook of Roman Antiquities* (1843–1846), which, after his death, was continued by Marquardt.

BECKERATH, Hermann von, one of the most remarkable public characters of Germany, was born at Krefeld (in Prussia), December 1801. He sprang from a commercial family, and made a considerable fortune as a banker. But he gave himself also to pursuits of a more intellectual character, and especially to the studies of jurisprudence and politics. The accession of Frederick-William IV. to the throne roused B. to a sense of the political condition of his country, and he devoted himself to work out its constitutional freedom. In 1843, he was elected representative of his native town in the provincial diet, and continued for several years to take a prominent part in Prussian politics. He was a deputy in the National Assembly which sprang up in the eventful year 1848, and held its sittings at Frankfort. His eloquence exercised considerable influence on bly. He was appointed minister of finance, after called to Berlin, to construct a this he failed. His strictly consti- not apparently agreeable to the ed to Frankfort. An advocate

for German unity, it was he who made use of the expression: 'This waiting for Austria is death to the union of Germany.' But he refused his assent to any revolutionary measure. When the retrograde movement set in, he resigned the posts he held under government, but continued, as a member of the second Prussian chamber, a vigorous opposition to the Manteuffel ministry, which had deserted the cause of German unity. He withdrew from the arena of political strife in 1852. After the return of Manteuffel to power, in 1858, B. was again elected a member of the Prussian second chamber; but he was obliged to decline the honour, on account of failing health. He devoted his later years to the affairs of Krefeld, his native town, where he died in May 1870.

BECKET, THOMAS A', Archbishop of Canterbury, was the son of a merchant, and was born in London in 1119. The story which makes his mother a Saracen is charmingly romantic, but there are doubts if it has any historical basis. He studied theology at Oxford and Paris, and afterwards law at Bologna, and at Auxerre, in Burgundy. Having been recommended to Henry II. by Theobald, Archbishop of Canterbury, who had had experience of his abilities, B. was promoted to the office of high chancellor, and thus (according to Thierry) resuscitated the hopes of the English as the first native Englishman, since the Conquest, who had filled any high office. His duties as high chancellor were numerous and burdensome, but he discharged them vigorously. He was magnificently liberal in his hospitality. Henry himself did not live in a more sumptuous manner. As yet, B. seems to have regarded himself as a mere layman, though, in point of fact, he was a deacon; but in 1162, when he was created Archbishop of Canterbury (an office which, as it then involved the abbacy of the cathedral monastery, had never but twice before been held by any but a monk or canon-regular), a remarkable change became manifest in his whole deportment. He resigned the chancellorship, threw aside suddenly his luxurious and courtly habits, assumed an austere religious character, exhibited his liberality only in his 'charities,' and soon appeared as a zealous champion of the church against all aggressions by the king and the nobility. Several noblemen and laymen were excommunicated for their alienation of church property. Henry II., who, like all the Norman kings, endeavoured to keep the clergy in subordination to the state, convoked the nobility with the clergy to a council in 1164, at Clarendon (near Salisbury), where the so-called 'constitutions' (or laws relative to the respective powers of church and state) were adopted. To these, the primate, at first, declared he would never consent; but afterwards, through the efforts of the nobles, some of the bishops, and, finally, of the pope himself, he was induced to give his unwilling approbation. Henry now began to perceive that B.'s notions and his were utterly antagonistic, and clearly exhibited his hostility to the prelate, whereupon B. tried to leave the country. For this offence the king charged B. with breach of allegiance, in a parliament summoned at Northampton in 1164, confiscated his goods, and sequestered the revenues of his see. A claim was also made on him for not less than 44,000 marks, as the balance due by him to the crown when he ceased to be chancellor. B. appealed to the pope, and next day leaving Northampton in disguise, fled to France, where he spent two years in retirement at Pontigny, in Burgundy. The French monarch and the pope, however, now took up his cause. B. went to Rome, pleaded personally before his holiness, who reinstated him in the see of Canterbury. B. now returned to France, whence he wrote angry letters to the English bishops, threatening them with excommunication. Several efforts were made to reconcile Henry and B., which, however, proved futile; but at length, in 1170, a formal agreement was come to at Fretville, on the borders of Touraine. The result was, that B. returned to England, entering Canterbury amid the rejoicings of the people, who were unquestionably proud of B., and regarded him—whether wisely or not is another question—as a shield from the oppressions of the nobility; but he soon manifested all his former boldness of opposition to royal authority. At last, it is said, the king, while in Normandy, expressed impatience that none of his followers would rid him of an insolent priest. The fatal suggestion was immediately understood, and carried into effect by four barons, who departed by separate ways for England. On the evening of the 29th December 1170, they entered the cathedral, and having failed in an attempt to drag him out of the church, there slew B. before the altar of St Benedict, in the north transept. Henry was compelled to make heavy concessions to avoid the ban of excommunication. The murderers, having repaired to Rome as penitents, were sent on a pilgrimage to Palestine; and, two years after his death, B. was canonised by Pope Alexander III., and the anniversary of his death was set apart as the yearly festival of St Thomas of Canterbury. In 1220, his bones were raised from the grave in the crypt where they had been hastily buried two days after his murder, and were by order of King Henry III. deposited in a splendid shrine, which for three centuries continued to be the object of one of the great pilgrimages of Christendom, and still lives in English literature in connection with Chaucer's *Canterbury Tales*. At the Reformation, Henry VIII. despoiled the shrine, erased B.'s name from the calendar, and caused his bones to be burnt and scattered to the winds. It is extremely difficult to estimate properly the character of Becket. We do not know what his ultimate aims were, whether, as some suppose, they were patriotic, i. e., *Saxon*, as opposed to *Norman*, or, as others believe, purely sacerdotal. At all events, the means he used for the attainment of them was a despotic and irresponsible ecclesiasticism. He admitted nothing done by churchmen to be secular, or within the jurisdiction of civil courts, not even murder or larceny. Fortunately, the Plantagenets were as dogged believers in their own powers and privileges as B. in those of the church; and by their obstinate good sense, England was ever kept in a state of wholesome jealousy of the pretensions of the Roman see. See Dr Giles's *Vita et Epistolæ S. Thomæ Cantuariensis* (6 vols. 8vo); Canon Morris's *Life of St Thomas Becket;* Canon Robertson's *Life of Becket;* Canon Stanley's *Historical Memorials of Canterbury;* J. G. Nichols's *Pilgrimages of Walsingham and Canterbury.*

BECKETS, on shipboard, a general name for any large hooks, short pieces of rope, or wooden brackets, used for confining ropes, tackles, oars, or spars, in a convenient place.

BECKFORD, WILLIAM, the [illegible] of Alderman Beckford, was bor[illegible] he was about nine years of [illegible] and he inherited the larger [illegible] property, consisting for [illegible] Jamaica, and of the esta[illegible] in His annual revenue is said to have [illegible] Young B. evinced unusual intellect[illegible] for in 1780 he printed a satirical *Biographical Memoirs of Extraordi[illegible]* which he does not spare li[illegible] the cant of criticism wi[illegible]

his wit. In 1778 he visited the continent, and met Voltaire at Paris. Two years thereafter, he started on his first great continental tour, and spent twelve months in rambling through Flanders, Germany, and Italy. In 1782 he made a second visit to Italy, and in 1787 he wandered through Portugal and Spain. In 1783 he married the Lady Margaret Gordon, daughter of Charles, fourth Earl of Aboyne; and in the following year he entered parliament as one of the members for Wells. In the same year he published *Vathek* in French. B. informs us that he wrote this tale, as it now stands, at twenty-two years of age, and that it was composed at one sitting. 'It took me,' he says, 'three days and two nights of hard labour. I never took off my clothes the whole time. This severe application made me very ill.' Immediately on its publication, *Vathek* was translated into English; B. professes never to have known the translator, but thought his work well done. In 1790 he sat for Hindon; in 1794 he accepted the Chiltern Hundreds, and again left England. He fixed his residence in Portugal, purchased an estate, and busied himself in the erection of the 'paradise' which Byron commemorated in *Childe Harold*. Tormented by unrest, he returned to England; and in 1801 the splendid furniture of Fonthill was sold by auction, and the next year his valuable collection of pictures was disposed of in London. These dispersions were no sooner made than he began a new collection of books, pictures, furniture, curiosities, and proceeded to erect a new building at Fonthill, the most prominent feature of which was a tower above 260 feet high. B. resided at Fonthill till 1822, when in one of those strange vagaries of feeling, of which his life was so full, he sold the estate and house, with all its rare and far-gathered contents, to Colonel Farquhar for £350,000. Soon after, the great tower, which had been raised on an insecure foundation, came to the ground. On the sale of Fonthill, B. removed to Bath, and immediately proceeded to erect another lofty building, the plan of which also included a tower, but this time not more than 100 feet high. While residing there, he did not mingle in Bath society, and the most improbable stories concerning the rich and morose genius in their neighbourhood were circulated among the citizens, and were believed by them. During all his life, B. was a hard-working student, and was devoured by a passion for books. Some of his purchases were perfectly imperial in their way. He bought Gibbon's library at Lausanne, to amuse himself when he happened to be in that neighbourhood. He went there; read in the fierce way that he wrote, three days and two nights at a sitting; grew weary of his purchase; and handed it over to his physician, Dr Scholl. Up till 1834 he had published nothing since *Vathek*, but in that year the literary silence of half a century was broken by the appearance of a series of letters, entitled *Italy, with Sketches of Spain and Portugal*, in two volumes. In the same year he republished his *Memoirs of Extraordinary Painters*; and in 1835 he issued another volume, entitled *Recollections of an Excursion to the Monasteries of Alcobaca and Batalha*, made in June 1794. From the period of this last publication till his death, which took place on the 2d of May 1844, he lived in the deepest retirement.

B., since the publication of his Arabian tale, has been a power in English literature. His wit, his sarcasm, his power of graphic description, may be seen in his journal and letters; and his higher faculties of imaginative conception and delineation reign in the unmatched passages that shadow forth in gloom and glory the 'Hall of Eblis.'

BECKMANN, Johann, a German author, known by his works on natural history and agriculture, was born at Hoya, in Hanover, June 4, 1739. After holding, for about two years, a professorship of physics and natural history in St Petersburg, he made a tour through Sweden, where he gained an acquaintance with the working of mines, and received for some time instructions from Linnæus. In 1766 he was appointed professor of philosophy, and in 1770 ordinary professor of political economy at Göttingen, where he died, February 4, 1811. He was the first German author who wrote on agriculture in a scientific style. Among his works may be mentioned: *Principles of German Agriculture* (6th ed. 1806), *Introduction to Technology* (5th ed. 1809), *Introduction to the Science of Commerce* (1789), *and Contributions to the History of Inventions* (1780–1805).

BECQUEREL, Antoine César, a distinguished French physicist, was born 7th March 1788, at Chatillon-sur-Loing, in the department of Loiret. In 1808, he entered the French army as an officer of engineers, and served with distinction in Spain under Marshal Suchet. He took part in the sieges of Tortosa, Tarragona, Valencia, and other places. On his return to France, he was appointed inspector of the *Ecole Polytechnique*; in 1814, he went through the campaign of France; and at the peace of 1815, retired from the service, that he might pursue his scientific studies with greater advantage. In 1819, he published a volume of geological and mineralogical researches, after which, his attention was principally devoted to electricity and magnetism. While studying the physical properties of yellow amber, B. had occasion to make experiments on the liberation of electricity by pressure. This led him to investigate the laws by which the phenomena of liberation are governed in chemical action. The result of his inquiries was the overthrow of Volta's theory of contact, and the construction, by him, of the first constant pile. He next discovered a method of determining the internal temperature of human and animal bodies, and by physiological applications demonstrated that, when a muscle contracts, there is a development of heat. B. is besides one of the creators of electro-chemistry. His labours in this branch of science opened for him, in 1829, the door of the *Académie de Sciences*. Since 1828, he had begun to apply electro-chemistry in the reproduction of mineral substances, and in the treatment by the humid way of silver, lead, and copper ores. In 1837 he was elected a member of the Royal Society of London. Among his earlier works were the *Traité de l'Electricité et du Magnetisme* (1834–1840); *Traité d'Electrochimie*; and the *Traité de Physique considérée dans ses Rapports avec la Chimie et les Sciences Naturelles*.—**Becquerel, Alexandre Edmond**, son of Antoine César B., an eminent physicist, was born at Paris, 24th March 1820. He was decorated with the Legion of Honour in 1851; and was appointed Professor of Physics in the *Conservatoire des Arts et Metiers*, 1853. He is a member of the *Académie des Sciences*. To his conjoint labours with his father are due interesting researches concerning the solar spectrum, and the elements of electric light (*Comptes Rendues de l'Académie*, 1839–1840); *Elémenta de Physique Terrestre et de Météorologie* (1847); *Memoires sur les Lois qui président à la Decomposition électro-chimique des Corps* (1849); and a *Note sur le tracé des Lignes Isothermes en France; des Recherches sur les Effets Electriques produits au contact des Corps Solides et Liquides en Mouvement* (1852 and 1853).

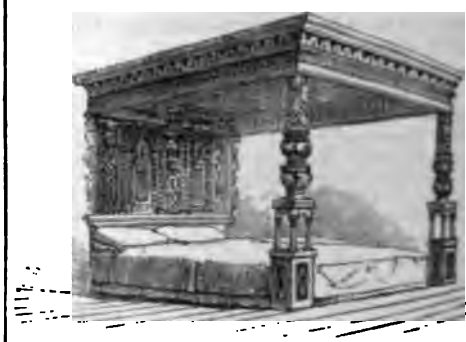
BECSKEREK NAGY, or **GREAT BECSKEREK**, a town of Hungary, in the county of Torontal, situated on the left bank of the Bega, about 45

miles south-west of Temesvar, with which place it is connected by canal. B. N. is an important market-town, and has a population (1869) of 19,666.

BED (with some variations in spelling, the word is common to all Germanic languages), an article of household furniture on which to sleep. Beds have been, and are of various forms, almost every country having its own kind of bed. In ancient times in Palestine, the B. seems to have been a simple kind of couch for reclining on during the day, and sleeping on at night, and readily removable from place to place, as is referred to in different parts of Scripture. About the heat of the day, Ishbosheth lay on his B. at noon (2 Sam. iv. 5). In receiving visitors, the king bowed himself upon the bed (1 Kings i. 47). Jesus saith, 'Take up thy B., and go unto thine house' (Mat. ix. 6). Yet, in these early times, beds or couches must, in some instances, have been highly ornamented: thus, 'I have decked my B. with coverings of tapestry, with carved works, with fine linen of Egypt' (Prov. vii. 16). The ancient Greeks had an elegant kind of beds in the form of open couches; they rested on a frame-work with posts; their mattresses were stuffed with wool or feathers; and they had coverings of a costly nature. The Romans had latterly beds of great richness and magnificence. They were of two kinds—the *lectus tricliniaris*, or couch for reclining upon at meals; and the *lectus cubicularis*, or B. placed in bed-chambers for sleeping in during the night. In eastern countries, at the present day, beds are for the most part simple couches or mattresses, which can be easily rolled up and carried away. In India, these couches are called *charpoys*. It will be understood that, in hot climates, few bed-clothes are used—in general, there being only a single sheet employed; care is taken, however, to use mosquito-curtains, without which rest would be impracticable. See MOSQUITO.

Throughout the continent of Europe, beds are of the open couch form, suitable in width for one person. They consist of a frame or bedstead, less or more ornamental, bearing one or two hair or wool mattresses; they are often provided with curtains, which depend from the ceiling of the room. In French hotels, such beds, neatly done up, are seen in sitting-rooms. In Germany, there is a common practice of placing large flat bags of down above the other coverings of beds, for the sake of warmth; and sometimes a bed of down altogether supplies the place of blankets. Throughout America, the beds are usually of the French, or open couch, form. The simplest kind of B. yet invented—except, indeed, the Oriental rug spread on the floor—is one frequently to be seen in America. The bedstead consists of a folding tressel, constructed with canvas on the principle of a camp-stool, with a movable head-board at one end to retain the pillow. With a hair-mattress, a pillow, and the necessary coverings laid on it, this makes one of the most comfortable beds imaginable. Its great advantage consists in its being easily folded up and put away in small space. In some of the hotels in the United States, when the arrival of guests exceeds the ordinary accommodation, a number of tressel-beds can be improvised in a few minutes in one of the large halls.

To prevent the falling of dust on the face, the Romans, in some instances, used canopies (*aulæa*) over their beds; in no country but England, however, has the canopied bedstead been thoroughly perfected and naturalised. The English four-posted B., or B. proper, is a gigantic piece of furniture, to which all persons aspire; and when tastefully fitted up, it offers that degree of comfort and seclusion which is characteristic of the domestic habits of the people. Like most English beds, it is made of sufficient size to accommodate two persons—the husband and wife—and is hence known as the family-bed. The dimensions of a good family B. are as follow: lying part, 6 feet 6 inches in length, by 5 feet 2 inches in breadth; height from the floor, 2 feet 9 inches; height of the posts from the floor to the top of the cornice, 9 feet. The roof or canopy is supported by the four posts, which are of mahogany, finely turned and carved. On rods along the cornice, hang curtains, which can be drawn around the sides and foot. The top stands towards the wall, so that the B. can be approached on the two sides. The curtains are composed of silk or worsted damask; in old times, they were of tapestry. With a spring-mattress below, and a wool-mattress above, the B. is complete, all but the blankets, sheets, bolster, and pillows. Ticks with feathers, laid on a hair-mattress, are also common. Fully equipped, a B., as just described, costs from £50 to £90. The great B. at Ware, in Hertfordshire, is one of the curiosities



Bed of Ware.

of England, and is referred to in the *Twelfth Night* of Shakspeare: 'Although the sheet were big enough for the Bed of Ware in England.' This famous B., which is still seen in one of the inns at Ware, measures twelve feet square, and is said to be capable of holding a dozen persons.

Latterly, a species of B. has been introduced into England, called the Elizabethan Bed. In point of size, it resembles the four-poster, but it has only two tall posts, with a canopy and curtains at the head, leaving more than half of the B. exposed. The tent-B. is an inferior kind of four-poster; it has a semi-circular light frame roof, and light calico curtains. A more novel variety of bedsteads are those made of iron or brass, formed like open couches, and adapted for cottages in summer, but not likely to come generally into use. The cold and humid climate of the British islands, independently of the habits of the people, has greatly influenced the form of the B.; for although it may be more wholesome to sleep without than with curtains, it will be difficult to introduce the practice of doing so, particularly during the winter and spring months. In the humbler class of rural cottages in Scotland, there still lingers the old custom of sleeping in wooden bedsteads with sliding doors. This box variety of B. is considered as unfavourable to ventilation, but it is the only kind of sleeping-place which is endurable where there are damp earthen floors and imperfect ceilings. Its use is disappearing in the progress of cottage improvement.

In old times in England, beds were formed with straw instead of wool, hair, or feathers, as at present; hence the phrase of a 'lady in the straw,' signifying that she is being confined. By the

humbler classes in the rural districts, straw is still used for beds, and also ticks stuffed with chaff. According to an old superstition, no person could die calmly on a B. of feathers of game birds.

For invalids, there have been invented air-beds and water-beds, which are now in use, and justly appreciated. See AIR-BED, also WATER-BED.

BED, or **STRATUM**, is a layer of sedimentary rock of similar materials, and of some thickness, cohering together so as to be quarried and lifted in single blocks. Beds are often composed of many fine laminæ or plates. The laminæ are the results of intermissions in the supply of materials, produced by such causes as the ebb and flow of the tide, river-floods, or the more or less turbid state of the water under which they were deposited. When the intervals between the supply of materials were short, the numerous laminæ closely adhere, and form a bed cut off from the superior deposit, by the occurrence of a longer interval, during which the bed became consolidated more or less before the next was deposited. When the lamination is obscure, or not distinct from the stratification, it would seem to indicate that the materials had been supplied without any intermission.

BED OF JUSTICE (Fr. *lit de justice*), literally, the seat or throne occupied by the French monarch when he was present at the deliberations of parliament. Historically, a B. of J. signified a solemn session, in which the king was present, to overrule the decisions of parliament, and to enforce the acceptance of edicts or ordinances which it had previously rejected. The theory of the old French constitution was, that the authority of parliament was derived solely from the crown: consequently, when the king, the source of authority, was present, that which was delegated ceased. Acknowledging such a principle, the parliament was logically incapable of resisting any demand that the king in a B. of J. might make, and decrees promulgated during a sitting of this kind were held to be of more authority than ordinary decisions of parliament. Monarchs were not slow to take advantage of this power to overawe any parliament that exhibited signs of independence. The last B. of J. was held by Louis XVI. at Versailles in September 1787.

BEDA, or **BEDE** (surnamed, on account of his learning, piety, and talents, VENERABLE), the greatest name in the ancient literature of Britain, and probably the most distinguished scholar in the world of his age, was born about the year 673 A.D. The exact spot of his birth is a point in dispute among antiquaries, but is commonly believed to have been in what is now the parish of Monkton, near Wearmouth, in Durham. In his seventh year he entered the neighbouring monastery of St Peter, at Wearmouth, where he remained for 13 years, and was educated under the care of the Abbot Benedict Biscop, and his successor, Ceolfrid. His religious instructor was the monk Trumberct; his music-master, John, chief-singer (*archicantor*) in St Peter's Church, Rome, who had been called to England by the Abbot Benedict. After these studies at Wearmouth, B. removed to the twin monastery of St Paul at Gyrwum (now written Jarrow), founded in 682; here he took deacon's orders in his nineteenth year, and was ordained priest in his thirtieth, by John of Beverley, then bishop of Hexham. In the shelter of his quiet and sacred retreat, while the tempest of barbaric strife raged without, and the hearts of all men in England were torn by sanguinary passions, B. now began earnestly to consecrate his life to such literature as was possible in those days, including Latin and Greek, and at least some acquaintance with Hebrew, medicine, astronomy, and prosody. He wrote homilies, lives of saints, hymns, epigrams, works on chronology and grammar, and comments on the books of the Old and New Testament. His calm and gentle spirit, the humanising character of his pursuits, and the holiness of his life, present a striking contrast to the violence and slaughter which prevailed in the whole island. To none is the beautiful language of Scripture more applicable—'a light shining in a dark place.' When labouring under disease, and near the close of his life, he engaged in a translation of St John's Gospel into Anglo-Saxon, and dictated his version to his pupils. He died May 26, 735, and was buried in the monastery of Jarrow; long afterwards (in the middle of the 11th c.), his bones were removed to Durham. His most valuable work is the *Historia Ecclesiastica Gentis Anglorum*, an ecclesiastical history of England, in five books, to which we are indebted for almost all our information on the ancient history of England down to 731 A.D. B. gained the materials for this work partly from Roman writers, but chiefly from native chronicles and biographies, records, and public documents, and oral and written communications from his contemporaries. King Alfred translated it into Anglo-Saxon. In chronology, the labours of B. were important, as he first introduced the Dionysian reckoning of dates in his work, *De Sex Ætatibus Mundi*, which served as a basis for most of the medieval chroniclers of leading events in the world's history. Among the editions of B.'s History may be noticed: the first, published at Strasburg about 1500; a much better edition, by Smith (Cambridge, 1722); one not less valuable, by Stevenson (Lond. 1838); another, by the late Dr Hussey (Oxf. 1846); a fourth in the *Monumenta Historica Britannica* (Lond. 1848); and that included by Dr Giles in his edition of the whole works of B., with an English translation of the historical parts (6 vols., Lond. 1843-1844). Entire editions of B.'s writings have been published in Paris (1544-1554), Basel (1563), and Cologne (1612 and 1688). English versions of his *Ecclesiastical History* were published by Stapleton, in 1565; by Stevens, in 1723; by Hurst, in 1814; by Wilcock, in 1818; and by Giles, in 1840. See Gehle's *De Bedæ Venerabilis Vita et Scriptis* (Leyden, 1838); Wright's *Biographia Britannica Literaria*, vol. i. (Lond. 1843); Surtees's *History of Durham*, vol. ii., pp. 2—6, 66—69.

BÉDARIEUX, a town of France, department of Herault, situated on the river Orb, well built, and second to none of its size in industry. Pop. (1872) 7374, who are engaged in the manufacture of fine and coarse cloths, stuffs, cotton and woollen stockings, hats, paper, oil, soap, leather, &c.

BEDCHAMBER, LORDS OF THE, officers in the British royal household, twelve in number, who, in the reign of a king, wait in turn upon the sovereign's person. They are under the groom of the stole, who attends his majesty only on state occasions. There are also thirteen grooms of the B., who take their turns of attendance. The salary of the groom of the stole is £2000; of the lords of the B., £1000; and of the grooms, £500 a year. These offices in the reign of a queen are performed by ladies. Corresponding to the groom of the stole is the mistress of the robes, and to the grooms of the B. are B. women. Her Majesty, Queen Victoria, has usually had from ten to twelve ladies, and extra ladies of the B., and eight B. women. These offices are objects of high ambition, from the access they give to the person of the sovereign, and are for the most part filled by 'the prime nobility of England.' They are not usually vacated on a

change of ministry, and Sir Robert Peel's departure from the usual etiquette on this point, in 1839, excited no small commotion.

BEDDOES, THOMAS, a physician of remarkable talents, and a popular writer on chemistry, physics, physiology, disease, &c., was born at Shiffnall, in Shropshire, 1760. In his studies at Oxford and Edinburgh, he distinguished himself by his knowledge of ancient and modern languages—the modern he acquired without the aid of a teacher—and by his varied attainments in botany, mineralogy, geology, chemistry, &c. In Edinburgh he attracted the notice of Dr Cullen, who employed him to add notes to Bergman's *Physical and Chemical Essays*. In 1785, he published a translation of Bergman's *Essays on Elective Attractions*, with valuable original notes. In 1787, he was appointed to the chemical lectureship in the university of Oxford. Here his lectures became exceedingly popular; but his unconcealed sympathies with the French revolutionary party in England, appear to have rendered his post so uncomfortable that he resigned it in 1792, and retired into the country. While in retirement, he wrote his work *On the Nature of Demonstrative Evidence, with an Explanation of Certain Difficulties occurring in the Elements of Geometry*, which was intended to shew that mathematical reasoning proceeds entirely on the evidence afforded by the senses, and that geometry is based on experiment. Several patriotic pamphlets followed, and the *History of Isaac Jenkins*, in which he laid down, in a popular style, rules of sobriety, health, &c., for the benefit of the working-classes. Of this work, 40,000 copies were sold in a short time. In 1798, after having spent considerable time in studying the use of artificial or medicated gases in the cure of diseases, especially consumption, aided by his father-in-law, Mr Edgeworth, and pecuniarily assisted by his friend, Thomas Wedgwood, he opened a pneumatic hospital at Bristol. This institution did not succeed in its main object, which was to shew that all diseases being, as B. maintained, referrible to an undue proportion or deficiency of some elementary principle in the human organism, could be cured by breathing a medicated atmosphere; and B., whose zeal had abated, retired from it about a year before his death, in 1808. The only results of the enterprise were several works by B. on the application of medicated air to diseases, and the introduction to the world of Davy (afterwards Sir Humphry), who was the superintendent of the institution. Sir Humphry Davy says of B.: 'He had talents which would have exalted him to the pinnacle of philosophical eminence, if they had been applied with discretion.' A life of B. was published in 1811 by Dr Stock.

BEDDOES, LOVELL THOMAS, eldest son of Dr Thomas B., and of Anna, third daughter of Richard Lovell Edgeworth, of Edgeworthstown, Ireland, sister of Maria Edgeworth, the distinguished novelist, was born at Rodney Place, Clifton, on the 20th July 1803. In 1809 Dr Beddoes died, leaving his son to the guardianship of Mr Davies Giddy, who, under his after-name of Sir Davies Gilbert, became the president of the Royal Society. By this gentleman, young B. was placed at the Bath grammar school; from thence, in 1817, he removed to the Charter House; and in May 1820, he entered as a commoner at Pembroke College, Oxford. In 1821 he published the *Improvisatore*. On this, his earliest poetic offspring, he looked with no favour at a later period, and was wont to hunt after stray copies in the libraries of his friends, and to disembowel them mercilessly when he effected a capture. In 1822 he published *The Bride's Tragedy*, which achieved for its author a great reputation. In 1824 he went to Göttingen to study medicine, and from this time forth continued to live in Germany and Switzerland, with occasional visits to England. While engaged at Frankfort (1847) in dissecting, he received a slight wound, which was the means of infusing a noxious virus into his system. His health now began to fail. In 1848 he went to Basel, where he fell from his horse, and injured his leg. An amputation following, he died on the 26th January 1849, and was buried in the cemetery of the hospital.

During his wanderings in Germany, B. was engaged at intervals in the composition of a drama entitled *Death's Jest-book*. This work, together with his other manuscripts, consisting chiefly of poetry, he, on his death-bed, confided to the care of a friend in England, desiring him to use his discretion as to their publication. In consequence, in 1851, his poetical works, with a memoir attached, appeared in two volumes. The merits of these dramatic fragments are quite peculiar. The author exhibits no power of characterisation, no ability in the conduct of a story; and, on the other hand, the crush of thought and image, the tone of music, and the depth of colour, are quite wonderful. Mr B. never could have become a dramatist, and of this, during his later years, he seems to have become aware. His works pall with splendour, and are monotonous by very richness. They are like a wilderness where nature has been allowed to pour herself forth in all her waste and tropical excess, unrestrained by a pruning hand, and unpierced by any path.

BEDEAU, MARIE ALPHONSE, a distinguished French general, was born at Verton, near Nantes, August 1804. In 1817 he entered the military school of La Flèche; in 1820, St Cyr; and in 1825 received a commission in the army. In the Belgian campaign of 1831—1832, he was aide-de-camp to General Gérard, and attracted notice at the siege of Antwerp. In 1836 he was sent to Algeria, as commandant of a battalion of the Foreign Legion. Here he acquired his great military reputation. He took part in most of the military operations by which the dominion of France was established over the natives, and rose to the rank of general of brigade. In 1847 he was for a short time governor of Algeria, but was superseded by the Duc d'Aumale.

When the revolution of February broke out, B., who was in Paris on leave of absence, was commissioned by Marshal Bugeaud to suppress the insurrection. This he found it impossible to do, but his conduct on the occasion has been severely blamed. By the Provisional Government he was appointed Minister of War, an office, however, which he immediately changed for the command of the city of Paris. On the formation of the Constituent Assembly, he was named vice-president, and always voted with the republican party. Along with Cavaignac, Lamoricière, and others, he was arrested on the 2d December 1851, and went into exile. B. was a Roman Catholic, and the fervour of his convictions gave rise to the groundless rumour that he had entered into holy orders. He died in 1863.

BEDEGU'AR, a remarkable gall (q.v.), often found on the branches of various species of rose, particularly of the sweet-brier, upon which account it is sometimes called Sweet-brier Sponge. It is produced sometimes by *Cynips rosæ*, sometimes by other species of gall insect. It is usually of a roundish shape, often an inch or more in diameter; its nucleus is spongy and fibrous, containing numerous cells, in each of which is a small larva; externally it is shaggy, being covered with moss-like branching

fibres, which are at first green, afterwards purple or red. It was formerly in some repute as a diuretic and as a remedy for stone; it has more recently been recommended as a vermifuge, and as a cure for toothache.

BEDELL, William, one of the best prelates that have adorned the English Church, was born at Black Notley, Essex, in 1570. He was educated at Emmanuel College, Cambridge, and after his ordination, officiated as a clergyman for several years at Bury St Edmunds. In 1604, he accompanied Sir Henry Wotton as his chaplain to Venice. There he resided eight years, deeply engaged in study, and honoured by the friendship of many distinguished men, in particular of Father Paul Sarpi, then engaged in the composition of his celebrated *History of the Council of Trent*. While residing here, he translated the English *Common Prayer Book* into Italian, which was highly appreciated by many of the Venetian clergy. On his return home, he resumed his pastoral duties at Bury, where he lived for some time in such retirement, that when his friend Diodati came to England, he inquired in vain for the admirable B., whose merits were so well known at Venice. He had given up hopes of finding him, when one day he encountered him in the streets of London. In 1615, B. was presented to the living of Horingsheath, in Suffolk, where he remained twelve years. His retired life and his Calvinistic theology long hindered the recognition of his merits. At length, in 1627, he was unanimously elected provost of Trinity College, Dublin, to which the fame of his learning and piety had extended. He refused to undertake the charge till positively commanded by the king. At the end of two years, he was promoted to the united bishoprics of Kilmore and Ardagh, the latter of which he resigned in the following year, 1630. He immediately set himself to reform the crying abuses that prevailed in his diocese, and with so happy a combination of wisdom, firmness, and charity, that even his enemies were constrained to do homage to his virtues. Among his other remarkable acts, he removed his lay-chancellor, and took upon himself the ancient episcopal jurisdiction of hearing and deciding causes. The chancellor obtained a decree against him in Chancery, with costs, but was so impressed with the superiority of the bishop's services to his own, that he dropped his claim, and even appointed a surrogate, with orders to pay implicit obedience to the authority of the bishop. The translation of the Old Testament into Irish was accomplished under B.'s direction (the New had been already translated), as well as of some of the homilies of Chrysostom and Leo on the reading of the Scriptures. On the breaking out of the rebellion in 1641, his popularity for some time saved his family from violence, his being the only English house in the county of Cavan that was not plundered. At length, on his refusal to dismiss his clerk, he was seized, and imprisoned in the castle of Cloghboghter. Thence he was removed to the house of a Popish merchant, where he remained for some time, till his death, at the end of a few weeks, February 7, 1642, in the seventy-second year of his age. The rebels followed his body to the grave in the church yard of Kilmore. Besides many other works, B. translated the Book of Common Prayer, and Father Paul's History. His [illegible] was published, Boston.

BEDFORD (anciently *Bedanford*), a town of the county, the county town of Bedfordshire, is situated on the [illegible] bank of the river Ouse, a distance of 74 miles [illegible] north-north-west of London by road, and on the middle of a broad expanse of rich pasture, wheat, and barley lands. The town is clean and well paved, and the drainage has been recently greatly improved by the Board of Health. The charitable and educational institutions of B. are mostly due to Sir W. Harpur, alderman of London, in 1561, who founded a free school, and endowed it with 13 acres of land. The enormous increase in the value of the property (from £150 to £14,000 or upwards a year) enables the trustees to maintain grammar, modern, and preparatory schools for boys, the same class of schools for girls, and 45 alms-houses. Formerly, much of the charity was under the control of popularly elected trustees, but under the Endowed Schools Act the constitution has been changed. Now, the governing body consists of 27, instead of 52, members—6 *ex officio* (the mayor of B., the lord-lieutenant of the county, and the members of parliament for the town and county), 9 nominated, and 12 representative. The eleemosynary element shewn in the maintenance of alms-houses, the giving of marriage-portions and apprentice-fees, &c. used to be predominant in the distribution of the charity, but now the educational prevails, the funds being annually divided thus: One-eleventh to the maintenance of the alms-houses; two-elevenths to elementary education; four-elevenths to the grammar-school, and high-school for girls; and four-elevenths to the modern schools. The only important manufacture of B. is that of iron goods, especially agricultural implements. Lace-making and straw-plaiting employ many poor women and children. A considerable traffic in malt, timber, coals, and iron is maintained with Lynn Regis, by means of the Ouse. B. is of great antiquity, and is mentioned in the Saxon Chronicle under the name of Bedcanford, as the scene of a battle between the Britons and Saxons in 571. The Danes burnt it in 1010. Afterwards its old castle, said to be built by Edward the Elder, is frequently mentioned in history. B. has returned two members to parliament since 1295. Pop. (1871) 16,850. John Bunyan was born near Bedford. He dreamed his immortal dream in B. jail, and ministered to the Baptist congregation in Mill Lane from 1671 to his death in 1688. The inhabitants still hold his memory in deep veneration, and some relics of him are preserved. A handsome new building, Italian in style, for the Bunyan schools, was completed in 1867. A bronze statue of Bunyan was erected by the Duke of Bedford in 1874.

BEDFORD, Duke of. There have been two distinct dukedoms of B. That to be noticed here existed in the person of John Plantagenet, Regent of France, and third son of Henry IV. of England, who was born about 1389. During his father's lifetime, he was governor of Berwick upon Tweed, and warden of the Scottish marches. In 1414, the second year of his brother's reign, he was created Duke of B.; and he was made commander-in-chief of the forces in England while Henry V. was carrying on the war in France. After the death of Henry V. (1422), B., in accordance with the dying wish of the king, left the affairs of England in the hands of his brother Gloucester, and went to France to look after the interests of the infant prince, his nephew. The regency of France, in compliance with a request of his deceased brother, he offered to the Duke of Burgundy, who refused it, he then assumed it himself, but not without consulting Burgundy as to the best method of carrying out the treaty of Troyes, by which Charles VI. declared Henry V. next heir to the French crown. On the death of Charles VI., a few months after Henry V., B. had his nephew proclaimed king of France and England, as Henry VI. In the wars with the dauphin which follow[illegible] B. displayed great generalship, and defe[illegible]

south-south-west of Dijon. The town is well built; has a fine parish church, Notre Dame, founded in 976 by Duke Henri of Burgundy; and a splendid hospital, founded in 1443 by Nicholas Rollin, Chancellor of Philip, Duke of Burgundy. There are several manufactories of serges, woollen cloth, and cutlery. A considerable trade is carried on in Burgundy and Champagne wines. B. gives its name to one of the best of the Burgundy wines. Pop. (1872) 10,100.

BEAUNE, Florimond, a distinguished mathematician, and friend of Descartes, was born in 1601, at Blois, in France, where he died in 1652. His labours and discoveries contributed greatly to the improvement of the modern analytical geometry first introduced by Descartes. Algebra was also enriched by B.'s shewing that, in equations to the fourth degree, the limits of positive roots might be found from the coefficients. B. may be regarded as the proper founder of the Integral Calculus, as he first endeavoured to deduce the nature of curved lines from the properties of their tangents. The so-called 'B.'s Problem' (which has been completely solved only by Jean Bernouilli), still given in the Integral Calculus, was for his time new and remarkable, it turns also on the determination of the nature of a curved line from a property of its tangent. The only work of his we possess is *De Æquationum Limitibus Opuscula duo, et Notæ Breves.*

BEAUTY. See *Æsthetics*, Art.

BEAUVAIS, an important manufacturing French town, capital of the department Oise. It is situated in the valley of the Thérain (a tributary to the Oise), about 41 miles north-north-west of Paris, and surrounded by rising woodlands. Formerly, B. was included in the old province, Ile de France. It is now the seat of government for the department, and the residence of a bishop, and contains a literary and economical society, a public library, a museum, &c. Among its several fine buildings, the most noteworthy is its uncompleted cathedral, the choir of which is the loftiest as well as one of the finest specimens of Gothic in France. The manufactures of B. include woollen cloths, shawls, carpets, Gobelin tapestry, &c. Pop. (1872) 13,532. B. is an ancient town. It was included in the country of the powerful *Bellovaci*, in *Gallia Belgica*, and was known by the Romans as *Cæsaromagus*, afterwards as *Bellovacum*. In the middle ages, it was styled *Belvacum*. In 850, and at other times, B. was desolated by the Normans. The *Jacquerie*, or Peasants' War, broke out in the neighbourhood of B., March 21, 1358. In 1443, B. was besieged by the English, who were repulsed by the heroic self-sacrifice of Jean Lignière. Again, in 1472, it was besieged by Charles the Bold of Burgundy, with an army of 80,000 men, when the women of B., under the leadership of the heroine Jeanne Lainé, surnamed La Hachette for her daring, displayed remarkable valour. The standard which the Burgundians had planted on the wall was torn down by Jeanne Lainé, and borne off by her in triumph. The banner is preserved in the town hall, and a procession, in which it is carried by young girls, annually commemorates the heroic deed. B. is the birthplace of the learned Dominican Vincent de Beauvais (Vincentius Bellovacensis).

BEAVER (*Castor Fiber*), a quadruped of the order *Glires*, or *Rodentia* (q. v.), valued for its fur, and for the peculiar substance called *Castoreum* (q. v.), which it yields, and also much noted for its instincts. Some naturalists regard the American B. as distinct from that of Europe and Asia; but the differences observable either in external or anatomical characters are very inconsiderable; and the opinion that a great difference exists in instincts and habits, appears to have been too hastily adopted. If there is only one species of B., it is very widely distributed in the northern regions of the world, reaching in America almost as far south as the Gulf of Mexico. It once existed in the British islands, where, however, it has long been extinct; and it has become rare in Europe, in many parts of which it was once common. It has become rare also in the United States, disappearing before man; but is nowhere so abundant as in that wide region of lakes and rivers which lies to the north and west of the settled parts of North America. Considerable numbers of beavers are found on the banks of the Obi and other rivers of Siberia, and in Kamtchatka.

The incisors or cutting teeth of the B. are remarkably strong, and exhibit in the highest degree the distinctive character of the order to which it belongs —the front of hard enamel, which in the B. is of a bright orange colour; the back of the tooth formed of a softer substance, more easily worn down, so

The food of the B. consists of the bark of trees and shrubs (birch, poplar, willow, &c.), and of the roots of water-lilies (*Nuphar luteum*) and other aquatic plants. In summer, it eats also berries, leaves, and various kinds of herbage. There is reason to think that it never, as has been supposed, kills or eats fish. Like some other rodents, it lays up stores of provisions for winter; but these, in the case of the B., consist chiefly of bark, or of branches, and even trunks of trees. Its extraordinary powers of gnawing are exerted to cut down trees of several inches in diameter, both for food, and for the construction of those houses and dams which have rendered it so much an object of admiration to mankind. A tree of 18 inches in diameter has been found thus cut down by beavers, although smaller ones are usually preferred; and when a tree of this size is cut, the branches only, and not the trunk, are employed in the architectural operations of the animals. These operations are very wonderful, although the statement, at one time commonly made, that beavers drive stakes into the ground, has no foundation in fact; and some of the other particulars which passed current along with it, were equally fabulous. The houses or lodges of beavers are grouped together near the edge of the water, the mud being scraped away from the front, so that there may be a sufficient depth of water there to allow free egress, even during the most severe frost. The winter stores of the animals, consisting of piles or heaps of wood, are also always under water, at such a depth that they cannot be locked up in ice. When the depth of water is not sufficient, the beavers construct a dam across the stream, by the side of which the lodge is placed; the dam is sometimes as much as 300 yards in length, convex towards the current, and most convex in the strongest currents, sometimes extending on both sides beyond the natural channel of the stream. The materials of which it is composed are sticks, roots, and branches, with stones, moss, grasses, and mud, strangely commingled, but in such a manner that the structure becomes absolutely water-tight. Branches of which the bark has been used for food, or taken off for winter provender, are very generally employed for building purposes. In their building, beavers interlace small branches with each other and with the larger; and a B. kept in confinement has been known to manifest this instinct, by interlacing branches with the bars of its cage, whilst it also filled the interstices with carrots, and other vegetables, given it for food, nicely bitten to the proper size, and packed in snow, to protect itself from the cold. B. dams are built with the sides inclining towards one another, so that although ten or twelve feet wide at bottom, they have a narrow top. The dams and houses are annually repaired, before winter comes on, the work being performed by night. 'In places,' says Hearne, 'which have been long frequented by beavers undisturbed, their dams, by frequent repairing, become a solid bank, capable of resisting a great force, both of water and ice; and as the willow, poplar, and birch generally take root and shoot up, they by degrees form a kind of regular planted hedge, which I have seen in some places so tall that birds have built their nests among the branches.' A broad ditch is often dug all around the lodge, so deep that it cannot freeze to the bottom, and into it the beavers make the holes by which they go out and bring their food. The larger lodges are in the interior, about seven feet in diameter, and between two and three feet high. The top is formed of branches of trees, mattod with mud, grass, moss, &c. The walls are very thick, and the whole structure not only secures much warmth, but is a sufficient protection from wolves, wolverines, and other beasts of prey. Different apartments have often one common roof, but they have usually no internal communication. The sleeping-places of the animals are around the wall of their lodge, the centre being left free; they are formed merely of a little grass or tender bark of trees. A single house seldom contains more than ten or twelve beavers, but many such families are often congregated in one place. Beavers, both in a wild state and in confinement, are scrupulously cleanly in their habits.

Beavers often sit on the hind-feet and tail, and eat in this posture, holding up the food in their fore-paws. They also walk on the hind-feet, with support of the tail, when they carry materials to their buildings, except branches, which are dragged. They have considerable power in the tail, and not unfrequently flap it, which has given rise to an opinion, perhaps not altogether erroneous, that they use their tails for plastering their buildings, or beating and adjusting the mud which is employed in them.

Beavers do not usually eat in their lodges, but in holes or burrows in the bank of the river, the entrance to which is from beneath the water, and which thence proceed obliquely upwards, often to a distance of many feet. To these holes the beavers also flee when their lodge is broken up; and it is therefore a common practice of the B. hunters to break up the B. lodges, that they may take the animals in their holes or vaults. Beavers are also taken by nets and traps.

It is chiefly in winter that beavers congregate together. During summer, they wander about a little. The young are generally produced in April or May, from two to seven at a birth. Their eyes are open when they are born.

Single beavers are frequently met with, which live apart from all others of their species. All of these are males, which, it is supposed, have been conquered and driven away by others of their sex.

In the parts of North America where beavers have now become rare, they live mostly in burrows in the river-banks, like those which are still found in Europe. Circumstances prevent them from following out their gregarious tendencies. That the beavers of Europe and Asia construct lodges and dams, when they have opportunity of congregating in sufficient numbers, appears to be no less certain than that those of America do so.

Large glandular pouches, two in number, closely connected with the organs of reproduction, contain the substance called *Castoreum* (q. v.). Its uses in the animal economy are by no means well known; they are probably analogous to those of musk, civet, &c.; but its peculiar pungent odour is so attractive to beavers, that use is made of it as a bait for B. traps.

The B. is very easily tamed; but no wooden cage will keep one confined. Except in the extraordinary building instincts already noticed, the animal exhibits no remarkable sagacity.—The use of the B.'s fur for making hats is well known. See HAT. An act of the English parliament, in 1638, prohibiting the use of any other material for hat-making, contributed to the rapid diminution of the number of beavers in the parts of North America from which their skins were then obtained. During great part of the 18th, and the earlier part of the 19th c., the number of B. skins annually exported from America appears to have been not less than 200,000. It is now greatly diminished, but is still large. The flesh of the B. is much esteemed as an article of food by trappers and others who frequent the fur-countries, but it is very oily.

Fossil remains of beavers, apparently of the same species with that now existing, are found in the

deposits referred by geologists to the pliocene and pleistocene periods. Other remains are also found of a much larger animal of the B. kind, which must have existed in Europe and Asia along with the present species, but which seems to have become extinct before the historic period. They were different, however, not merely in size, but in other particulars so important, that Owen has constituted for the 'great B.' a distinct genus, *Trogontherium* (Gr., a chewing or gnawing beast).

Of existing animals, the most closely allied to the B. is the *Coypu* (q. v.), sometimes called the Chilian B. (*Myopotamus Coypus*), which yields the fur called *Racoonda* (q. v.).

BEA'VER. See HELMET.

BEA'VER WOOD. See MAGNOLIA.

BEBEE'RINE is one of the alkaloids, and is obtained from the greenheart bark or *bebeeru* of Demerara. It is used in medicine in place of quinine, which it resembles in properties, though it is not so powerful in its action as a tonic and febrifuge. The condition in which it is generally sent into market is as the sulphate of B., occurring in shining scales of a pretty brown colour, and soluble in water.

BEBEE'RU, BEEBEE'RU, or BIBI'RI. See GREENHEART.

BECCAFI'CO (*Sylvia hortensis*, or *Curruca hortensis*), a little bird of the family of the *Sylviadæ*, or Warblers (q. v.), sometimes called the Pettychaps, and sometimes the Garden Warbler, rather rare in Britain, but abundant in some of the more southern parts of Europe, and in great demand for the table in Italy, its flesh being regarded as of peculiar delicacy. It is a mere summer bird of passage, however, not only in Britain, but even in the south of Europe. The upper parts are mostly of a brown colour, the lower parts whitish. It is a bird of very pleasing song. B. is an Italian name, and is sometimes extended to other birds of the same family used for the table.

BECCAMOSCHI'NO (*Sylvia cisticola*), a little bird of the family of the Warblers, found in Italy, and remarkable for its nest, which resembles that of the tailor-birds, being usually placed in a bush of lengthened herbage, the leaves and stalks drawn together over it, and a flooring formed for it by leaves curved across below, and sewed together generally with some kind of vegetable fibres.

BECCARI'A, CESARE BONESANA, a political and philanthropic writer, was born at Milan 1735 or 1738. The opinions of the French encyclopædists, especially those of Montesquieu, had the greatest influence in the formation of his principles and sentiments. The work which most favourably exhibits the character and genius of B. is his *Trattato dei Delitti e delle Pene* (Treatise on Crimes and Punishments), first published in 1764, in which he argues against the severities and abuses of criminal law, especially capital punishment and torture. The work was extremely popular, and was translated into several European languages. It is marked by eloquence, sensibility, and lively power of imagination. Kant unfairly accuses the author of an affected humanity, though it must be admitted that the German philosopher has exposed the invalidity of some of the arguments brought forward. On the whole, however, the work of B. is acknowledged to have done great good, and the subsequent reforms in the penal code of European nations have generally taken the direction he has pointed out. He was among the first to advocate the beneficial influence of education in lessening crime. This naturally brought upon him the hatred of the priesthood, who, according to their usual formula of persecution, accused him of impiety; but their malice was frustrated by the efforts of Count Firmian, the Austrian governor of Lombardy, a man of liberal and enlightened sentiments. In 1768, B. was appointed Professor of Political Philosophy at Milan, and achieved great success as a lecturer. He died of apoplexy in November 1793. In the course of his life he published several works.

BEC-FIN, the common French name for different species of birds of the family of *Sylviadæ*, or Warblers (q. v.). It is sometimes to be met with in English books.

BÊCHE-DE-MER, or TREPANG, an article of luxury among the Chinese, consisting of the dried bodies of several species of *Holothuria* (q. v.) or Sea-cucumber, which are found in great abundance in the shallow waters of lagoons, and on reefs, from the south-eastern coasts of Asia to New Holland. The traffic in B. is very extensive, and the Malays catch the animals, and prepare them in large quantities for the Chinese market. They are usually about 8 or 9 inches long, but some are 2 feet in length, and 7 or 8 inches in girth. They are often found nearly buried in the coral sand, their feathered tentacula alone floating above it. The larger ones are sometimes speared in shallow water; but most of them are taken by divers in depths of from 3 to 5 fathoms. An expert diver will bring up eight or ten at a time. They are split down one side, boiled, pressed flat with stones, dried in the sun, and afterwards in smoke, and packed in bags, in which state they are bought by the Chinese, and conveyed in junks to China. Fleets of Malay prahus are employed in the search for this curious production of the sea. Macassar is the great staple-place of the trade, and from it above 3000 cwt. of B. are annually sent to China, the price varying, according to the kind and quality, from thirty shillings to twenty guineas per cwt. There is also a considerable export of B. from Manilla. B. is extremely gelatinous, and is very much used by the Chinese as an ingredient in rich soups.

BECHER, JOHANN JOACHIM, author of the first theory of chemistry, was born at Speier in 1635. In his youth, he had many difficulties to contend with, but his zeal and perseverance overcame them all. He acquired an extensive knowledge of medicine, physics, chemistry, and even politics, and in 1660, was made a member of the Imperial Council at Vienna. While residing in this city, he assisted in establishing several manufactures, and drew up the plan of an East Indian commercial society, but unfortunately he fell into disgrace, and had to leave the city. He next went to Mainz, and subsequently lived in Munich, Würzburg, Haarlem, and finally London, where he died in 1682. He had many enemies, and was accused—not altogether unjustly—of charlatanry. Nevertheless, he rendered important services to chemistry. His *Physica subterranea* was the first attempt made to bring physics and chemistry into close relation; in those two he sought the causes of all the inorganic phenomena in the world. He at the same time began to construct a theory of chemistry, and also investigated the process of combustion. B. taught that every metal was composed of an earthy substance common to all metals; of a combustible principle also identical in all; and was differentiated from other metals only by the possession of a peculiar mercurial element; when a metal was heated, until it had changed its form, the mercurial substance was discharged, and nothing remained except metallic calx. Herein lies the first germ of Stahl's phlogistic theory, which obtained universal currency until the time of Lavoisier.

BECHUANS. See BETJUANS.

BECKER, GOTTFRIED WILHELM, a German author, born at Leipsic in 1778, entered the university of that city with the view of studying medicine, and having taken his doctor's degree in 1801, settled there as a practising physician and a writer of medical works, several of which reached many editions. The wars of the period led him, however, to turn his attention to history and modern languages, and he became well known by his contributions to periodicals, his series of popular histories, and his translations from the English, French, and Italian. In 1833, B. entirely relinquished practising medicine, and devoting himself to literature, became a fertile and admired contributor to many of its more popular branches. He died at Leipsic, 17th January 1854. He published several attractive volumes of travels in his own country, peculiarly adapted to the young, among which we may instance his *Tour to the Harz, Sketches of Southern Germany*, &c. His historical writings, which are not less numerous, chiefly narrate the events of his own time. Amongst them we may particularise *Andreas Hofer, Egypt as it Now is, The Fate of Spain in Modern Times*, &c. In light literature, also, he was very successful as a translator. All his works have been published at Leipsic.

BECKER, JOHN PHILIP, one of the most active Radical politicians of late years, was born, March 1809, at Frankenthal, in the Palatinate on the Rhine, and brought up as a brushmaker. The French revolution of July 1830 gave a political bias to his tendencies, and he took part in the political agitations of the day, in consequence of which he was imprisoned; but in 1833 he was released, and exerted himself warmly on behalf of his brothers in opinion. In 1837, he settled in Switzerland, taking a part in several Radical publications, and organising, in 1838 and 1845, volunteer corps. In the autumn of 1847, he was summoned to the military bureau at Berne, and being chosen adjutant of Ochsenbein's division, fought against the Sonderbund with acknowledged bravery. Upon the failure of Hecker's attempt to revolutionise Baden in 1848, B., who had organised troops for his support, returned to Switzerland, to plan an expedition of German and Swiss auxiliaries, to support the cause of freedom in Rome and Sicily. Their movements being frustrated, he led his troops in the summer of 1849 into the Palatinate and the Duchy of Baden, where a rising had taken place, and acted a prominent part in many engagements. Subsequently, he settled in Geneva, and engaged successfully in commerce. A history of the revolution of 1849, in Southern Germany, has been published by him and Esselen. B. is a man of strong and hardy frame, and for prudence and decision, ranks high among the leaders of the revolutionary party.

BECKER, KARL FERDINAND, born at Leipsic in 1804, may be named with Kiesewetter and Winterfeld as one of the best German writers on the history of music, and also as an excellent composer for the organ, as is proved by his trios and other compositions well adapted to the genius of the instrument. Among his works may be mentioned: a *Choral-book*, or collection of psalm and hymn tunes (Leipsic, 1844); *Choral Melodies* for Spitta's Psalter and Harp, 1841; a *Catalogue* of his musical library, one of the most extensive in Germany; *On the Choral Collections of Various Christian Churches*, 1841; *The Choral Compositions of the 16th and 17th Centuries*, 1847; and *The Composers of the 19th Century*, 1849.

BECKER, KARL FERDINAND, one of the most distinguished German philologists, was born at Liser, in the old electorate of Treves, in 1775. At first a teacher, he afterwards studied medicine, and ultimately settled as a practitioner at Offenbach. Here he educated his own children with such success that several families induced him to take charge of theirs, and thus his house was converted into an academy (1823), which he conducted till his death in 1849. This gave scope to his early predilection for linguistic studies, to which his scientific training led him to give a quite new direction. B. contemplates language as an *organism*, pervaded by strict logical laws. From this point of view, he wrote his *Deutsche Grammatik* (2d ed., 1842). He neglects too much the historical development of language, and thus, as might be expected, comes at times into conflict with the results of comparative philology; yet his work is valuable for its logical consequence, and for its leading idea of organism in language. Besides a *Schulgrammatik* (8th ed., 1862), which is an outline of his larger work, he published several other treatises on the German language.

BECKER, WILHELM ADOLF, a distinguished German author, was born at Dresden in 1796. Originally intended for commercial life, he soon abandoned a pursuit which he found uncongenial to his tastes, and devoted his time to the acquisition of learning. In 1816, he came to Leipsic, where he studied theology, and more particularly philology. In 1840, he travelled through Italy; and in 1842, was appointed Professor of Archæology at the university of Leipsic, where his prelections on the Latin authors were numerously attended. He died at Meissen, 30th September 1846. His lively fancy, aided by a thorough knowledge of the classic languages, enabled him to make quite a novel use of antiquity. In his *Charicles* (Leip. 1840), he ventured to reproduce the social life of old Greece; and in his *Gallus* (Leip. 1838), to give sketches of the Augustan age at Rome. The learning which he has contrived to stuff into his picturesque sentences is marvellous, not to speak of the quantity buried in his *excursus*, or disquisitions, which, in the English translation of the works by Metcalfe, are transferred from the text to the end of the volumes. Lockhart's *Valerius* is the only thing in English literature which corresponds to these compositions of the German author. B.'s treatise, *De Comicis Romanorum Fabulis* (Leip. 1837), is a valuable contribution to the history of Roman dramatic poetry. His most important work, in a scholastic point of view, is his *Handbook of Roman Antiquities* (1843-1846), which, after his death, was continued by Marquardt.

BECKERATH, HERMANN VON, one of the most remarkable public characters of Germany, was born at Krefeld (in Prussia), December 1801. He sprang from a commercial family, and made a considerable fortune as a banker. But he gave himself also to pursuits of a more intellectual character, and especially to the studies of jurisprudence and politics. The accession of Frederick-William IV. to the throne roused B. to a sense of the political condition of his country, and he devoted himself to work out its constitutional freedom. In 1843, he was elected representative of his native town in the provincial diet, and continued for several years to take a prominent part in Prussian politics. He was a deputy in the National Assembly which sprang up in the eventful year 1848, and held its sittings at Frankfort. His eloquence exercised considerable influence on this assembly. He was appointed minister of finance, and shortly after called to Berlin, to construct a cabinet; but in this he failed. His strictly constitutional advice was not apparently agreeable to the court, and he returned to Frankfort. An advocate

of the affairs of the hive. There can be no doubt that bees possess in a very high degree the sense of smell; and their possession of the senses of taste and hearing is almost equally unquestionable, whatever difficulty there may be in determining the particular organs of the latter sense.—The wings of bees, like those of other hymenopterous insects, are four in number; thin and membranaceous; the hinder pair always smaller than the others; and in flight, attached to them by a number of small hooks, so that the four wings move as if they were two.

The sting of bees is a very remarkable organ. It consists of two long darts, with a protecting sheath. A venom bag is connected with it, and powerful muscles for its propulsion. The wound appears to be first made by the sheath, along which the poison

Bee Sting, highly magnified.

A, sting of bee; S, sheath of sting; F, end of sting, greatly magnified, shewing six barbs curved upwards; B, glands for secreting poison; C, ducts through which it flows to D, where it is kept ready for use; O, circular dilatation to prevent sting being thrust too far out of sheath.

passes by a groove; and the darts thrust out afterwards in succession, deepen the wound. The darts are each furnished with a number of barbs, which render it so difficult to withdraw them quickly, that bees often lose their lives by the injury which they sustain in the effort.—The males are destitute of sting.

The great family of bees is divided into two principal sections called *Andrenetæ* and *Apiariæ*, or *Andrenidæ* and *Apidæ;* the latter names, however, being sometimes employed in senses more restricted. In the first of these sections, the *ligula* is comparatively short and broad; in the second, it is lengthened, and has the form of a filament. All the *Andrenetæ* live solitarily, as well as several subdivisions of the *Apiariæ*. These solitary bees do not lay up stores for their own winter subsistence; but they display very wonderful and various instincts in the habitations which they construct and the provision which they make for their young. There are among them males and perfect females only, and no neuters. The work of preparing nests and providing food for the young seems, in all of the species, to be performed exclusively by the females. *Colletes succincta*, a common British species of the *Andrenetæ*, affords an example of a mode of nest-making, which, with various modifications, is common to many species of that section. The parent B. excavates a cylindrical hole in the earth, usually horizontal, to the depth of about two inches, in a dry bank or a wall of stones and earth. The sides of this hole are compacted by means of a sort of gelatinous liquid, secreted by the insect, and it is occupied with cells, formed of a transparent and delicate membrane, the substance of which is the same secretion in a dried state. The cells are thimble-shaped, fitting into each other, a little space being left at the furthest end of each for the reception of an egg and a little paste of pollen and honey. The last cell being completed, and its proper contents deposited in it, the mouth of the whole is carefully stopped up with earth.—Some of the solitary bees, possessing great strength of mandibles, excavate their nests in old wood. *Xylocopa violacea*, one of the *Apiariæ*, not uncommon in some parts of Europe, makes a tunnel not less than twelve or fifteen inches long, and half an inch wide, which is divided into ten or twelve cells; an egg with store of pollen and honey is deposited in each compartment, and as the lowest egg is hatched first, a second orifice is provided at that part of the tunnel, through which each of the young ones in succession comes forth to the light of day, each larva, as it is about to change into the pupa state, placing itself with its head downwards in the cell.—Numerous species of solitary bees excavate their tunnel-shaped nests in the soft pith of decayed briers or brambles, of the particles of which they also form their cells.—Some species of *Megachile*, *Osmia*, &c., line them and divide them into cells with portions of leaves or of the petals of flowers. See LEAF-CUTTER BEE. Some of the solitary bees make their nests, not in the earth, but in cavities of decaying trees, or other such situations, where they construct their cells without the same necessity of excavation; but some of them, by a very admirable instinct, surround their nest with down collected from the leaves of plants, an excellent non-conductor of heat, so that a nearly uniform temperature is maintained in situations in which the changes would otherwise be great and rapid. Some bees make their little nests in old oak-galls, and there are species which appropriate empty snail-shells to that use.—Some species of the genus *Megachile* build their nests of a sort of mason-work of grains of sand glued together with their viscid saliva. The nest of *M.* [illegible], thus constructed, is so hard as not to be easily penetrated by a knife, and very much resembles a splash of mud upon a wall.

The social bees live in comm[illegible] like [illegible] ants, which also, like theirs, com[illegible] and neuters—these last bei[illegible] imperfectly developed, and [illegible] liarities of form and struc[illegible] and employments, remark[illegible] of the perfect females. [illegible] niently divided into H[illegible] Bees (a[illegible] Bees, of the latter of [illegible] the [illegible] (see the next section of [illegible]ticle) as the type. Before [illegible] lar account of the [illegible] remark that the swe[illegible], of genus *Apis*) are [illegible] of the warm p[illegible] the (*Apis mellifica*, which now [illegible] of America, and which [illegible] the forests to a consi[illegible] abodes of civilised m[illegible] which were conveyed [illegible] is said not to have b[illegible] Mississippi before 1797. numerous animals, some of which equally delight to prey upon their larvæ. The B. was amongst the ancient Egyptians the hieroglyphical emblem of royalty. The B. domesticated or cultivated in Egypt, is not, however, our common Hive B., but another species called *Apis fasciata;* and in Italy and Greece a species called *A. Ligustica* is employed, which has been recently introduced into England, and is now domesticated at the B.-house of the Apiarian Society, Muswell Hill, near London. These species differ little from the common Hive B., and their honey is very similar; but that of some species is considerably different. *A. unicolor*, of Madagascar and the Isle of France, yields an esteemed honey of a green colour. It is domesticated, or is the object of human care and attention there, as are also *A. Indica* in some parts of India, and *A. Adansonii* in Senegal. We regret that our limits do not permit us to give a particular account of any of these species.—The genus *Melipona* is nearly allied to *Apis*. The species are natives of South America, and their honey is extremely sweet and agreeable, but very liquid, and apt to ferment. They make their nests in the cavities or on the tops of trees.

The Hive Bee.—Natural History.—The instincts and social economy of the Hive B. (*Apis mellifica*) have been studied with great attention both in ancient and modern times, and discoveries—than which, perhaps, nature presents nothing more interesting and wonderful—have rewarded the patient observations of Huber and others who have devoted themselves to this subject. *Apiarian societies* have been formed for the purpose of prosecuting this single branch of natural history, and of promoting successful apiculture, or the economical keeping of bees.

The Hive B. is probably not a native of Britain, and may even have been brought to Europe from the East. Its communities seem ordinarily to number from 10,000 to 60,000 individuals, and there appears no reason to think that the care bestowed upon the insect by man, or the *hives* which he has provided for it, have made any important difference in this respect. One member of each community is a perfect female—the queen or mother B.; from 600 to 2000 at certain seasons are males; and the remainder are *neuters* or workers, the real nature of which has been explained in the previous part of this article.

The workers have a body about half an inch in length, and about one-sixth of an inch in greatest breadth, at the upper part of the abdomen. The antennæ are twelve-jointed, and terminate in a knob. The abdomen consists of six joints or rings, and under the scaly coverings of the four middle ones are situated the *wax-pockets* or organs for the secretion of wax. The extremity of the abdomen is provided with a sting, which is straight. The basal joint of the hind tarsi is dilated to form a pollen-basket, and the legs are well provided with hairs for collecting the pollen and brushing it into this receptacle.—The males or *drones*, so called from the peculiar noise which they make in their flight, are much larger than the neuters, and thicker in proportion. The antennæ have an additional joint. The eyes are remarkably large, and meet upon the crown.—The perfect females are considerably longer than either the workers or males; they are also distinguished by the yellow tint of the under part of the body, and very remarkably differ from all the other inmates of the hive in the shortness of their wings, which, instead of reaching to the extremity of the abdomen, leave some of its rings uncovered.—Neither males nor queens have wax-pockets, nor have they pollen-baskets. Their legs also are less hairy. The sting of the queen B. is curved. The mandibles both of the males and perfect females are notched or

Bees.
1, queen; 2, drone; 3, neuter.

toothed beneath the tip, which those of the workers are not.—It will be seen from this brief description that the sexes differ so widely as to appear, if the contrary were not well known, insects of different species; but still more remarkable is the difference between the females and the workers when we consider that it is all to be ascribed to the different forms of the cells in which the eggs are hatched and the young bees reared, and to the different kinds of food with which they are supplied. All doubt upon this point is removed by the interesting discovery of Schirach, that when a hive is deprived of its queen, the bees provide themselves with another, if there are eggs or very young larvæ in the cells appropriated to the breeding of workers; proceeding immediately to transform, for this purpose, one of these cells, and sacrificing, without scruple, the eggs or larvæ in the cells adjoining that selected for transformation and enlargement. These are facts well ascertained, but of which science has yet been unable to give any explanation.

The greater part of the life of the queen or mother B. is spent in laying eggs for the increase of the population of the hive; and this increase goes on at a rapid rate, as the queen not unfrequently lays 300 eggs in a day. The number, however, varies greatly. In cold weather it is very small, but the invariable presence of brood in different stages, in a well-stocked hive, proves that some eggs are laid even in winter. During the later spring months the number is very great; many practical apiarians considering that as many as 1000, or even 2000, are deposited daily. The community, however, is not destined to an indefinite increase; but in certain circumstances, *swarming* takes place, and new colonies are founded.

The impregnation of the queen takes place in the air, and usually within a few days after she herself has emerged from the cell. It is the only occasion of her ever leaving the hive, except that of swarming, and there is no repetition of it during her whole life. The question has therefore been asked, why there are so many males in a B. community; but no very satisfactory answer has been given to it. The males are not known to fulfil any other purpose than that of the propagation of their species; and after the swarming season is over, the greater part of them are ruthlessly massacred by the workers, as if in dread of their consuming too much of the common store. The greater part of the workers themselves are supposed scarcely to live for a year; the duration of the life of queen bees is often more than three years.

The queen B., when about to begin to lay eggs, is the object of great attention on the part of the workers, and so continues. She moves about in the hive, attended by a sort of retinue of about ten or fifteen workers, by some of which she is frequently supplied with honey. But the name of queen B. appears to have originated in a mistaken notion that something analogous to a monarchy subsists in the B.-hive; and imagination being permitted very free scope, many things have been invested with a false colouring derived from this analogy. The queen or mother B. appears to be the object of particular regard, as indispensable to the objects for which the B. community subsists, and to which the instincts of all its members are variously directed. She moves about, depositing her eggs in the cells which the workers have prepared, and they are ready to take charge of each egg from the moment that it is deposited. Her employment requires that she should be fed with food collected by others, and many of the workers are in like manner supplied with food whilst busy within the hive, as well as the larvæ in the cells; but there is no evidence whatever of anything like authority exercised by the queen, or, indeed, of any superiority of one over another in the whole multitude.

The queen B. at first lays eggs which give birth to workers, and afterwards there takes place a laying of eggs which become drones. With unerring instinct, she places each egg in the kind of cell appropriate to it; whilst also, at the proper time, cells of the proper kind are prepared beforehand by the workers, the drones' cells being larger than the workers' cells. The cells in which future queens are to be reared are very unlike all the others, but the eggs differ in no respect from those deposited in workers' cells. It is a curious circumstance, that queens, of which the fecundation has been prevented till they are considerably older than usual, lay only drone eggs. It occasionally also happens that some of the worker bees lay eggs, and these invariably produce drones.

The eggs of bees are of a long shape and bluish-white colour, about one-twelfth of an inch in length. They are hatched in about three days. The larvæ are little worm-like creatures, having no feet, and lying coiled up like a ring: they are diligently fed

Egg, Larva, and Pupa of Hive Bee.

a, egg, and very young larva; *b*, young larva coiled up at the bottom of the cell; *c*, larva when ready to undergo metamorphosis; *d*, pupa.

by the working bees, until, in about five days, when large enough nearly to fill the cell, they refuse food, upon which the attendant bees seal up the cell with wax, and the larva, spinning itself a fine silken envelope or cocoon, is transformed into a pupa; and about the eighteenth day—or, in the case of drones, the twenty-fourth day—from the deposition of the egg, the young B., in its perfect state, breaks the covering, and issues from the cell. It is caressed and supplied with food by the attendant bees, and is believed not to try its wings until the following day. The cell from which a young B. has issued is speedily cleaned out, and prepared for the reception of another egg or of honey. The fine silken envelope of the pupa, however, remains attached to the cell, of which the capacity thus becomes gradually smaller, until the cells of old combs are too small to receive eggs, and can be used for honey alone, a fact of which the importance in relation to the economical management of bees is obvious.—The spinneret, by means of which the larva spins the cocoon, is a small organ connected with the mouth.—The food with which the larvæ are supplied is a mixture of pollen, honey, and water, with the addition, possibly, of some secretion from the stomachs of the working bees, in which it is prepared. It varies a little, according to the age and kind of the larva, and the peculiarities of that given to young queens appear to be indispensable to their fitness for their future functions. Pollen is constantly found stored up in the cells of the hive, and is often called B.-bread. Most people have met with such cells in honey-comb, and have observed the bitter and peculiar taste of the contents.

The combs of a bee-hive are parallel to each other, forming vertical strata of about an inch in thickness, and distant about half an inch from each other. The cells are therefore nearly horizontal, having a slight and somewhat variable dip towards the centre of each comb. The central comb is generally first begun, and next after it those next to it on each side. Circumstances frequently cause some departure from this uniform and symmetrical plan, which, however, still remains obvious. Each comb consists of two sets of cells, one on each side; and it may be mentioned as an illustration of the wonderful industry of bees, and the results of their combined labours, that a piece of comb, 14 inches long by 7 inches wide, and containing about 4000 cells, has been frequently constructed in 24 hours. The greater part of the comb usually consists of the kind of cells fitted for breeding workers, a smaller part of it of the larger or drone cells. After the principal breeding-season is over, the cells of some parts of the comb are often elongated for the reception of honey; and sometimes comb of greater thickness, or with unusually long cells, is constructed for that purpose alone, in which case the mouths of the cells are inclined upwards, more than is usual with the ordinary brood cells. When a cell has been completely filled with honey, its mouth is *sealed* or covered with wax.

It is impossible to look at a piece of comb taken from a B.-hive, without admiring, not only its beauty, but the perfect regularity of the size, form, and arrangement of the cells; and the more carefully that it is examined, the more must it be admired. For in it are practically solved, by an instinct which can only be referred to the infinite wisdom of the Creator, some problems difficult to human science, particularly in the combination of the greatest economy of materials and of space, with the most perfect convenience and the greatest strength. It appears even at a glance, that the cells are hexagonal or six-sided, the hexagons perfectly regular, and in this way there are no interstices between the cells. Now, the mathematician knows that there are only three regular figures, that is, figures of which all the sides and angles are equal, bounded by straight lines, with which a space can be perfectly filled up in this way—the equilateral triangle, the square, and the hexagon; and of these the hexagon is at once the most suitable for the larva of the B. in its form, and the strongest in its nearest approach to the circle. The circular form itself would have left large interstices. But this is not all: the same wisdom which has given the solitary bees, already noticed, their instinct to surround their nest with a cottony substance, which

serves as a non-conductor of heat, has directed the hive B. to the constant adoption of a mode of constructing its combs, which adds greatly to the strength they would have possessed with the same amount of materials, if the cells had been merely regular hexagonal prisms, and the partition in the middle of the comb, between the cells of the one side of it, and those of the other, therefore a simple plane. It is so far from being so, that when carefully examined, it appears, if the expression may be used, the most ingenious part of the whole structure. It is composed of a multitude of little rhombs, or four-sided figures, with equal and parallel sides, and two obtuse and two acute angles, the obtuse angles being invariably angles of 109° 28', and the acute angles of 70° 32', agreeing precisely with the results of mathematical analysis, applied to the difficult question of the form of the facets of a three-sided pyramid, which should terminate a six-sided prism, so as to combine the greatest economy of materials with the greatest strength. On looking at a piece of empty honey-comb, placed between the eye and the light, we readily perceive that the cells are not opposite to each other, cell to cell; but that the point of meeting of three sides of three cells, on one side, is opposite to the centre of a cell on the other side—a circumstance which of itself we cannot but regard as calculated greatly to increase the strength of the whole fabric. It follows also from this, that the terminating pyramids of the cells on the one side do not interfere with the form of the cells on the other side, but the three rhombic facets, which terminate each cell, belong likewise to three distinct cells on the opposite side of the comb.

Pyramidal bottoms of Cells.

The only departure from perfect regularity in the form of the cells, is in the transition from the smaller or workers' cells to the larger or drones' cells, which, when it takes place, is managed with great simplicity and beauty of contrivance. Our limits, however, do not permit us to enter further into this subject.

The material of which the cells are built is chiefly wax (q. v., and see Bees-Wax), which is at first of a white colour, but becomes brownish-yellow with age, and in very old combs, almost black. Although wax exists as a vegetable product, yet bees-wax is now known to be produced by a chemistry which is carried on in the bodies of bees; and it has been found that they produce wax and build combs when supplied only with honey or saccharine substances. The *wax-pockets* in the abdomen of working-bees have been already referred to. The bees which are about to proceed to wax-making, suspend themselves in clusters in the hive, attaching themselves to each other by means of hooks with which their feet are provided; and whilst they remain motionless in this position, the wax appears to be formed, in small scales, which they afterwards take in their mouths and curiously work up with a secretion from the mouth itself, passing the wax, in the form of a minute riband, through the mouth, first in one direction and then in the opposite one, and finally depositing it in its proper place for the foundation of the comb. One B. always begins the comb alone, the rest, in gradually increasing numbers, proceed in accordance with what has been already done. The bees which elaborate and deposit the wax, do not, however, construct the cells, which is done by others, partly at least by a process of excavation in the wax deposited. It is supposed by many naturalists, that some of the working-bees are exclusively wax-workers, some nurses, &c.; but others think that there is only one class of working-bees, all ready for any kind of work according to circumstances.

But wax, although the chief, is not the only material of the combs. *Propolis* (q. v.) is also employed in small bands to give greater strength to the cells, the mouths of which are surrounded with it, and made thicker than their walls. This substance, which is obtained by bees from the viscid buds of trees, is also employed for more firmly attaching the combs to the hive, for closing up apertures in the hive, for covering up obnoxious substances, intruding slugs, &c., which are too large to be removed, and for a variety of similar purposes.

It has been already stated that queen-bees are hatched and reared in cells different from the rest. They are, indeed, very different, being vertical and not horizontal in their position, not hexagonal, but rather oval in form, and much larger than the other cells, even in proportion to the size of the animal that is to inhabit them: they are generally placed on the edge of a comb, and when they have served their purpose, are partially removed, so that during winter they resemble acorn-cups in appearance.

Two queens cannot exist in the community together. There is implanted in them the most deadly rivalry; and the mother-B., if permitted, would even tear open every queen cell of which the inmate has nearly approached maturity, and inflict death by her sting. One of those wonderful instincts, however, with which bees are endowed, counteracts this at those times when, upon account of the increased numbers of the community, and in order to the formation of new colonies, it is requisite that it should be counteracted. The workers throng around the queen, hem her in, and prevent the execution of her purpose. The cell of the young queen is also carefully guarded, and she is not permitted to leave it. At such times peculiar sounds, produced probably by the action of the wings, are emitted both by the actual queen under restraint in her movements, and by the young one in the cell, which may be heard by an ear applied to the outside of the hive, and are familiar to B. cultivators as one of the surest signs of swarming. The queen now becomes restless; her agitation communicates itself to those around her, and extends through the hive; the ordinary work of the community is in great part neglected; fewer bees than usual are seen to leave or return to the hive; and at last the queen-B. rushes forth, preceded and followed by crowds which press and throng upon each other, form a buzzing cloud in the air, and very generally settle upon a bush in the neighbourhood, where they soon congregate closely together, hanging by their claws in a dense cluster. Sometimes they rise up in the air, and fly off at once to a considerable distance, apparently to some previously selected place in the thick top of a tree in the chimney or roof of a house, where they happen to find an aperture—or in some such situation. More frequently, they settle not far from the hive which they have left, often on some very humble plant, or even on the grass, and soon rise again. It is the care of the cultivator to prevent this by providing them immediately with a suitable habitation in a new hive, invitingly placed above them, or into which he puts the swarm after they have congregated closely together as above described. It sometimes happens that bees hurry out of their hive without their queen, in which case they do not in general congregate so closely together

where they settle, and soon return to the hive again. Swarming generally takes place in a fine day; and when the bees seem on the very point of *coming off*, a cloud passing over the sun is enough to retard it. Bad weather occasionally not only retards but prevents it, the young queens being at last killed in their cells.—When the first swarm of the season has left the hive with the old queen, as is usually, if not always the case, the imprisoned young queen is set at liberty; and if the B. community is a large and prosperous one, other young queens also come forth from their cells, and leave the hive with successive swarms, the number of which depends upon the climate, the season, &c. In Britain, it is not uncommon for a B.-hive to send off three swarms in a summer, the first being almost always the largest, and not unfrequently itself sending off a swarm before the season is over.

Bees left without a queen, and with no means of supplying the want, appear to feel themselves cut off from the very purpose of their existence; the labours of the community are relinquished, and its members are dispersed and die. It has already, however, been stated, that bees left without a queen can provide themselves with one, by transforming and enlarging a worker's cell which contains an egg or very young larva. This process is sometimes carried on as if by several distinct parties, in different parts of the hive at once; and as if aware that time will be gained, the bees generally prefer cells containing larvæ of two or three days old to those containing eggs.

Bees become partially torpid during cold weather, consuming much less food than they would otherwise require. They are readily aroused from this state, however, as may at any time be proved by tapping on a B.-hive, when it will be found that the temperature of the interior of the hive rises rapidly. Respiration is considerably lessened in the state of partial torpidity, and the temperature rises when it is resumed. The respiration of bees takes place by air-tubes or *trachea* (see INSECTS), and is very active when the insect is in a state of activity. The respiratory movements are easily seen in looking at a bee. The consumption of oxygen by this process might be expected soon to reduce the atmosphere within a hive to a state in which it could no longer support animal life; but in summer, when respiration is active and the hive populous, a constant circulation of air is maintained by the insects themselves, some of which are employed in a rapid vibration of their wings for this purpose. A greater or smaller number of them, according to circumstances, may frequently be seen thus engaged in fanning the air at the mouth of a bee-hive.

It may well be deemed an extraordinary fact, that among the enemies of bees are to be reckoned certain species of moth, which, notwithstanding the danger of the stings of the bees, enter the hives and deposit their eggs. After the eggs are hatched, the larvæ feed upon the combs. Mice sometimes eat their way into the hives in winter, and destroy and plunder unmolested.

Bees are sometimes very destructive to each other in their combats, as when one B. community is assailed by others for the purpose of plunder. To this the weaker communities are liable, particularly when flowers are few, and bees are awakened to full activity in the warm days of early spring. The narrower that the entrances of bee-hives are at this season, at least of the less populous hives, the less likely is the B. owner to suffer loss from this cause, as the narrow entrance is more easily defended even against very numerous invaders.

Management of Bees.—We do not think it necessary to enter largely into the subject of *Apiculture*—the cultivation or management of bees.

It is, of course, necessary that the *apiary* or stock of B.-hives should be situated in a neighbourhood where flowers sufficiently abound for the supply of honey. It is, however, by no means certain to what distance bees roam. Some authors mention one mile as the probable distance; but the opinion has apparently been hazarded on mere conjecture, and there seem to be good reasons for supposing that a much greater distance might more correctly be named. But whatever distance bees may be capable of travelling in quest of honey, it is undoubtedly of great importance that they should have good feeding-ground in the immediate neighbourhood of the apiary; and in many parts of the world, the practice prevails of removing them from place to place, according to the season, in order that advantage may be taken of the greatest abundance of flowers. Thus in the south of Scotland, B.-hives are very frequently removed to heath-covered tracts in the beginning of August, and remain there till the heath is out of flower; and this affords in many parts of the country the most plentiful honey-harvest, although in other parts, especially where white clover abounds, the greatest quantity of honey is obtained earlier in summer. The difference between *Heather Honey* and *Flower Honey* is well known in Edinburgh. No small number of B.-hives from that city and its immediate vicinity are annually conveyed for a few weeks to the Pentland Hills. The conveyance of bees 'to the heather' is generally accomplished either by a handbarrow or a spring-cart of easy motion, so that the combs may not be displaced by shaking; and the mouth of the hive is carefully closed with a plate of perforated zinc, or other contrivance for keeping in the bees and permitting circulation of air. Fifty or one hundred B.-hives may often be seen collected in one place, and under the care of one person, during the heather-season.—In Egypt, far greater numbers of hives (of *Apis fasciata*) are often kept in a single vessel on the Nile, and are conveyed from place to place on the river, according to the succession of flowers in the different districts. A somewhat similar practice prevails on the Rhone; and the transporting of bees (*Apis Ligustica*) from pasture to pasture has been usual in Greece, in Asia Minor, and in Persia, from remote antiquity.

As to the form of B.-hives, and the material of which they should be made, there are great differences both of opinion and practice. Glass hives, and hives with glass-windows, which can be covered at pleasure with wooden slides, are employed by those who wish to observe the movements and habits of bees; but for profitable purposes, wood and straw are in Britain the only materials in common use. A simple and useful form of a capped hive is shown in the accompanying illustration. For the material of a hive, wood has the advantage over straw in its greater neatness and durability; but there is a disadvantage in the greater likelihood that, unless shaded from the sun, portions of the comb may be so much melted as to fall in hot weather. In some parts of Europe, cylindrical cork-hives are much used, made by removing the wood of a portion of the cork-tree, and leaving the bark uninjured; and hives of earthenware are common in Greece and Turkey. The form of hives is of little consequence; but it is important that the owner should have facilities for giving increased room both above and below the stock-hive: increased room above is required for the reception of pure honey-comb unmixed with brood, and the capability of adding to the hive below, by raising it up an additional story, is often requisite to prevent swarming, which

is incompatible with the collection of a large store of surplus honey.

Bees require attention at the time of swarming,

Simple form of Bee-hive,
With cap removed to shew glass top.

that they may not fly away and be lost. They require also to be fed during winter, when, on account of a bad season, the lateness of the swarm, or other cause, they have not enough of honey to support them. A common rule is, that the weight of the contents of the hive must be at least twenty pounds, that the bees may survive the winter without being fed; and even in this case a supply of food for a short time in spring promotes the activity of the bees, and their summer prosperity. The food ordinarily supplied to bees is either the coarser kind of honey, or sugar and water. Strong ale and sugar boiled are also frequently given as food. The practice has very largely prevailed in Britain and elsewhere, of killing bees by fumes of sulphur, in order to take from them their honey in the end of autumn, a portion only of the increase of the stock being kept through the winter. This practice still has its advocates; but many now take only what they can by top boxes or *supers*, or by cutting out combs, preserving all hives which are not so light that there is no good hope of their surviving the winter. It may be doubted if, in almost any part of the country, the number of bees kept is so great as nearly to exhaust the floral resources, and in all probability this may yet become a much greater source of wealth than it is in Britain.

When honey is to be taken from bees, the person doing it must be carefully protected from their stings by gloves, veil, &c. It is best done during the heat of a fine day, when the bees more readily leave the combs of the *super* that is taken away, and return to their hive. A little gentle tapping generally causes them to leave the combs, and a feather is used for brushing off those which are slow to do so. The smoke of the common Puff-ball (q. v.) causes them to fall down in a stupefaction from which they speedily recover, and its use is very convenient. It is gathered and dried for the purpose. Chloroform is also sometimes used for the same purpose, but the effect is apt to be fatal, unless care is taken to choose the morning of a fine day, so that the stupified bees may have time to recover in the air and sunshine.

Bees are much less apt to sting when swarming than at other times, and in general all the necessary operations are performed without gloves or veil, and with perfect safety. The sting of a B. is to many persons a thing of no great consequence, although, in some, it causes great local inflammation and swelling, and general derangement of health. The application of a little ammonia usually relieves the pain, or an onion or shallot cut through the middle may be applied, and has the same effect.

The apiary should, if possible, be in a sheltered place, and where it enjoys a good amount of sunshine. The hives are very generally placed at small distances in the open ground, but some B.-keepers protect them by a shed. In the former case, each hive is usually covered with a straw-hood in winter, to keep away the rain, as damp is particularly injurious to bees. For the avoidance of damp, and to prevent the bees from coming in contact with the ground when they hang in a great cluster at the door of the hive—as they often do before swarming, when the weather is hot, and the hive very populous—each hive is raised to a height of at least fifteen or eighteen inches from the ground.

Bees, Law Relating to. B. are stated by Blackstone to be wild by nature (*feræ naturæ*), but when hived and reclaimed, are regarded in the nature of *property* belonging to the person on whose ground or soil they have swarmed; and in support of this doctrine, he refers to the Charter of the Forest, 9 Henry III. c. 13, which allows every freeman to be entitled to the honey found within his own woods. The qualified property which may be thus held in B. continues while the swarm remains on the soil; and in the event of flight, so long as the owner can pursue it. Indeed, so clearly are they considered in law to be of the nature of property, that it has been decided in England that B. may be the subject of larceny (q. v.).

The same appears to be the Scotch law. Mr Erskine, who may be described as the Scottish Blackstone, founding on the Roman law, lays down that, when B. have abandoned their hive, not being observed and followed, they are understood to have recovered their original liberty; and if they light on the grounds of another, and are enclosed by him in a new hive, they become his property. See Ownership.

Bee, Humble. See Humble-Bee.

BEECH (*Fagus*), a genus of trees of the natural order *Cupuliferæ* (q. v.). The male catkins are almost globose, stalked, their flowers consisting of a bell-shaped 5—6-cleft perianth and 8—15 stamens. The female flowers, which grow on the same trees, consist chiefly of a germen with three awl-shaped styles, and are situated two or rarely three together within a stalked involucre, which bears on its outer surface many fleshy threads. This involucre, after the flowering is over, closes and forms a husk resembling a sort of capsule, which when ripe opens in four valves, is externally covered with soft spines, and encloses one or two (rarely three) triangular nuts, which bear the name of *Beechmast*.—The species are not numerous; all of them are forest-trees of great beauty.—The Common B. (*F. sylvatica*) forms whole forests in many parts of Europe. It grows to a height of 100–120 feet, and a diameter of 4 feet; and particularly when standing alone becomes a very ornamental tree with far-spreading branches, which often droop gracefully almost to the ground. It has thin, ovate, obscurely toothed leaves, finely ciliated on their margins. Its bark is smooth, often of a whitish colour; and it is remarkable for the frequency with which h[illegible] woolen knobs—abortive branches—occur in [illegible] does not grow readily under the sha[illegible]

in B. woods may sometimes be found rare plants almost peculiar to such situations. The B. thrives best in light soils; and does not send its roots deep

Common Beech.

into the ground, but rather horizontally under the surface. The wood is more or less of a reddish-brown colour, as the tree has grown in a dense forest, or has been freely exposed to sun and air. It is very hard and solid, but brittle; and when exposed to the open air, very liable to rot and to be eaten by worms. It is therefore not adapted to the purposes of the house-carpenter; but when kept always under water, it is very durable, and is accordingly employed in the erection of mills, and for weirs, sluices, &c. It is also employed for many purposes by cabinet-makers and turners. It is very much used in France for making the *sabots* or wooden shoes of the peasantry, being preferred for this purpose to every other wood except walnut, on account of its property of not absorbing water. It is one of the best kinds of firewood in Europe. Its

Common Beech.

a, part of a branchlet with leaves and catkins, reduced; *b*, a single male flower; *c*, a single female flower.

ashes yield much potash and of excellent quality. The raspings of the wood are used in the preparation of vinegar. See VINEGAR and PYROLIGNEOUS ACID. The bark is sometimes employed for tanning when oak-bark is scarce. The B. bears lopping well, and is often planted for hedges; and it is a curious fact, that when it is prevented from attaining a tree-like size, and is kept closely pruned, the withered leaves remain on the branches all winter, which is not the case in other circumstances. In some countries, as Dauphiny and Switzerland, the leaves of the B. are collected in autumn before they have been much frost-bitten, and are used for making beds or mattresses.—Beechmast, when fresh, has a sweet taste, like that of a walnut. It contains in large quantity a bland fixed oil, along with a starchy farina, a little sugar, and an astringent substance. A volatile, narcotic, poisonous principle, called *Fagine*, is also found in it, but more in the rind than in the kernel; and when not only the smooth leathery outer rind, but also the thin brown inner pellicle have been removed, it is wholesome food. It is, however, more generally used for feeding swine, poultry, &c., and is much employed in France and other parts of Europe for the manufacture of *Beech Oil*, which, when expressed without the application of heat, and well clarified, has an agreeable taste, is fit for use as food, and keeps long without becoming rancid. When less pure, it is used for lamps and in the arts. The oil-cake which remains is good food for poultry, for swine, and even for oxen, but is injurious to horses. Many manufacturers of cocoa adulterate it with beechmast, first depriving the cocoa of its oil, which they sell separately as cocoa-butter, and trusting to the oil of the B. for supplying its place.—B. forests anciently abounded in England, and great herds of swine were fed in them. The B. is not, in general, found in Europe north of lat. 59°, although it occurs two degrees further north in the Scandinavian peninsula. It is found in the temperate parts of Asia and in North America; the WHITE B. of that country being generally regarded as the same species, a very common tree in some parts of the United States. In gardens and pleasure-grounds a variety is very frequently to be seen, of which the leaves have a blood-red colour. The same colour appears also in some degree in the leaves of the RED B. of North America (*F. ferruginea*), which is distinguished by elongate-ovate, coarsely serrated, and much acuminated leaves. It forms extensive forests in the North-eastern States and the adjoining British possessions; and its wood, which is of a somewhat red or rusty colour, is more valued than that of the White B.—Two species of B. are found on the mountains of Java; four are natives of the more elevated parts of the south of New Zealand; several belong to the south of South America. The genus is, in fact, more characteristic of the colder latitudes of the southern than of the northern hemisphere. *F. betuloides* (also known as *F. Forsteri*) is the 'myrtle-tree' of the mountains of Tasmania—a very large tree with evergreen leathery leaves, in form much resembling those of the birch, although the general habit of the tree agrees with that of other beeches. The same species is the evergreen B. of Terra del Fuego, where it forms forests of which the dark green foliage contrasts strikingly in winter with the dazzling snow. There can be little doubt that it will soon become a favourite and common ornamental tree in Britain. The wood is too heavy and brittle for masts, but makes tolerable planks, and is carried to the treeless Falkland Islands for roofing houses. *F. Antarctica* ascends higher on the mountains about the Strait of Magellan. It has deciduous leaves, and much resembles the common B.—*F. procera* grows in the Andes of Chili, and attains a majestic size. It is a valuable timber-tree.

BEECH-DROPS. See CANCER ROOT.

BEECHER, the name of a celebrated American family of preachers and litterateurs.

LYMAN B. was born at Newhaven, Connecticut,

U. S., October 1775; studied divinity under the well-known American theologian Dwight; and obtained a church at East Hampton, Long Island, in 1798. He afterwards removed to Litchfield, Connecticut, and from thence, in 1826, to Boston. In 1832, he was appointed president of the Lane Theological Seminary at Cincinnati, and to the charge of the second Presbyterian church in that city. In 1842 he returned to Boston, and in 1856–1857 removed to Brooklyn, Long Island. He died in 1863. B. wrote on temperance, slavery, and theology. His collected works, in 3 vols., revised by himself, were published at Boston. Three of his sons—Edward, Charles, and Henry Ward—are also ministers, and have written extensively on religious subjects.

Henry Ward B., the best known, was born at Litchfield, Connecticut, in 1813, and after graduating at Amherst College, Connecticut, he studied theology under his father at Lane Seminary. After ten years' pastorship of two churches in the state of Indiana, he removed to Plymouth Church, Brooklyn, New York, 'an organisation of Orthodox Congregational believers,' where he still remains. He is said to have the largest congregation in the United States, and his popularity as a public lecturer is great. He was editor of the *New York Independent*, one of those newspapers called 'religious;' since 1870, he has edited a paper of the same sort, called the *Christian Union*. B. has published several *Lectures to Young Men*, which have gone through many editions; *Life Thoughts*; a novel named *Norwood*; and he is said to be finishing the *Life of Christ*. He has visited Europe twice, last in 1864.

Catherine B., eldest daughter of Lyman B., was born at East Hampton, Long Island, in 1800. From 1822–1832, she was principal of a female seminary at Hartford, Connecticut, and afterwards of a similar institution at Cincinnati. She is a fertile and popular writer, chiefly on subjects coming within the sphere of her own sex, but also on physiology, theology, mental and moral philosophy, &c.

Harriet B. See Stowe, H. B.

BEECHEY, Sir William, R.A., an English portrait-painter of high reputation, was born at Burford, Oxfordshire, December 12, 1753. He entered the Royal Academy as a pupil in 1772, and devoted himself chiefly to portrait-painting, in which he was so successful, that in 1793 he was chosen portrait-painter to Queen Charlotte, of whom he painted a full length. In the same year he was elected an associate of the Royal Academy; and in 1798, he received the honour of knighthood, and was made a Royal Academician for his picture of the Review of the 3d and 10th Dragoons in Hyde Park by George III. (accompanied by the Prince of Wales and Duke of York), which is reckoned B.'s greatest work. B. now received the patronage of the royal family—most of the members of which sat to him—as well as that of the court nobility. Among his portraits are those of Lord Nelson (preserved in the Clothier's Hall, London), Sir William Hamilton, Lord St Vincent (in Fishmonger's Hall), Lord Cornwallis, John Kemble, and Mrs Siddons. B. is not a portrait-painter of first rank, but his portraits are generally characterised by easy attitude and naturalness of expression. He retired from his profession in 1836, and died at Hampstead in January 1839.

BEECHEY, Frederick William, son of Sir William B., the portrait painter, was born in London, February 17, 1796. He entered the navy when he was ten years of age, and at the age of fifteen was present in an engagement off the coast of Madagascar, in which three French frigates were captured. In 1818, he took part under Franklin in a scientific voyage of discovery to the north pole, of which the results were published by order of the Admiralty (1843). For the services he rendered with his pencil during this voyage, B. received a grant of £200 from parliament. In 1819, he was engaged in another arctic expedition under Sir Edward Parry; and in 1821, rendered other important services to science by his exploration of part of the north coast of Africa, of which the results were published in 1828. After being appointed commander, Captain B., in 1825, received a commission to proceed by the Pacific Ocean and Behring's Strait to the Polar Sea, in order to communicate, if possible, with Franklin, who was to make the journey overland from North America. The explorers did not meet, although at one time they were within 150 miles of each other. He returned in 1828, having been two years and a half away, and in 1831 published a narrative of his voyage, which was afterwards followed by an account of the botany and zoology of the Arctic regions. Port Clarence and Port Grantley, to the south-east of Cape Prince of Wales, were discovered by B. in 1827. He was afterwards engaged in surveying the coast of Ireland and of South America; and was made Rear-admiral of the Blue in 1854. He died in 1856.

BEEDER, the capital of a district of the same name in the Nizam's territories. It is about 75 miles to the north-west of Hyderabad, being in lat. 17° 53′ N., and long. 77° 36′ E. It stands near the right bank of the Manjera, a considerable tributary of the Godavery, and occupies a table-land about 2400 feet above the sea, and about 100 feet above the adjacent country. Though B. was formerly a place of grandeur and importance, yet it is at present remarkable chiefly for its manufactures in a compound metal made up of twenty-four parts of tin to one of copper.

BEE-EATER (*Merops*), a genus of birds of the order *Insessores* and tribe *Fissirostres*; the type of a family, *Meropidæ*, nearly allied to that of the Kingfishers. The birds of the B. family have rather long slightly arched beaks, and long pointed wings: they are mostly of a green colour; resemble swallows in flight; and, like them, prey on insects, but chiefly on bees, wasps, and other hymenopterous insects. Their skin is very thick. The species

Common Bee-eater (*Merops apiaster*).

of the genus *Merops* are numerous in Africa and Asia; none are known in Au[illegible]a: t[illegible] are European, one of which, the [illegible] (*M. apiaster*), is common in the so[illegible]

as a summer bird of passage. It is a very rare bird in Britain. It is mentioned by Aristotle, under the name *Merops*, as very destructive to bees. It seizes them on the wing, and also often watches near their hives, and at the mouths of wasps' nests. It breeds in holes, which it excavates in the banks of rivers. 'When the young are partly fledged, but not yet fit to fly, they creep to the mouth of their holes, where they seem to enjoy the happy summer light and genial sunshine; but on the least alarm, they trundle stern foremost into their inner chambers, where they lie concealed until tranquillity again prevails.' In the banks of the Don and Volga, the excavations made by the flocks of bee-eaters are so numerous, that the bank in many places resembles a honey-comb. Livingstone describes the banks of the Leeba, in South Africa, as perforated in a similar manner. The Hottentots watch the flight of the bee-eaters, that they may be guided to the nests of bees.

BEEF. See FOOD AND DRINK, DIET.

BEEF-EATER, a term now applied jocularly to certain functionaries belonging to the Yeomen of the Guard (q. v.), who, ever since the time of Henry VII., have formed part of the train of royalty, attending the sovereign at royal banquets and other state occasions. They have maintained the same costume, with a slight alteration made in 1858, for nearly four centuries; and this costume has had much to do with their attractiveness to sight-seers. The origin of the term is a case of what Dr Latham calls 'words of foreign simulating a vernacular origin.' It was originally *beaufetier* or *buffetier* (Fr.), one who attends the *buffet* or side-board. Similar instances of false etymology, arising from resemblance in sound, are seen in *Shot-over* (a hill near Oxford), from *Chateau Vert*; *sparrow-grass*, from *asparagus*; *ancient*, for *ensign*; *dog-cheap*, from the old English *god-kepe*, i. e., *good-cheap*, meaning *a good bargain*; &c.

BEEF-EATER (*Buphaga*), a genus of birds, of the order *Insessores*, tribe *Conirostres*, to which the name Ox-pecker is also and more correctly given. The beef-eaters have short bills, square at the base, and rather swollen towards the point. They are accustomed to sit upon the backs of buffaloes, camels, and other large animals, and to feed upon the larvæ of gadflies, which they find in their hides. They are exclusively African. One of the species is the Buffalo Bird of South Africa. Livingstone mentions that the sight of the bird being much more acute than that of the buffalo, it is much more easily alarmed by the approach of danger; but the buffaloes always begin to look about them when the birds rise from their backs.

BEEF-TEA is a light and pleasant article of diet, obtained from the flesh of the ox. It is generally prepared by placing the meat (as lean as possible) in cold water, which is gradually heated, and then allowed to *simmer* for two hours or so; but the best method appears to be to commence by chopping the meat small, adding the cold water, and rapidly heating so as to bring it to boil. A little salt is then added, to suit the taste. Either process, by commencing with cold water, succeeds in dissolving out of the meat the savoury natural juices which it contains to the extent of about one-eighth of its weight. Occasionally, hard-toasted bread, in fragments, is added to the tea just before being partaken of, which imparts to it some of the nutritious qualities of the bread. In using the B., the bread may or may not be eaten. The popular notion is, that the B. contains all the nourishing constituents of the entire amount of meat employed in its preparation; but this is erroneous, as much nutritious matter is resident in the seven-eighths of the original meat, left as residuary fleshy fibre, though the latter will no doubt prove of difficult digestion. The chemical constituents of B. are *gelatine*; *albuminous matter*; *kreatine*, a substance resembling *theine*, the essential principle of tea and coffee; *extractive matters* (*osmazome*), to which the tea owes most of its colour and flavour, besides a part of its nutritious qualities; *lactic acid*; *salts*; a *little fat*; *saccharine matter*, and *water*. B. is highly palatable, and from its very easy digestion, it is recommended to invalids and convalescents. Mutton, treated in a similar manner, yields a broth or tea which is not so easily digested, and is hurtful to persons of weak stomach, especially if the fat be not skimmed off from the liquid. A knuckle of veal affords a similar broth or tea; but it is not so light as B., and, moreover, gelatinises on cooling. A broth or tea prepared from a young chicken is, of all decoctions of animal matter, the most readily digested, and is specially suitable for invalids, where great irritability of the stomach exists.

BEEF-WOOD. See CASUARINA.

BEE'HIVE-HOUSE, a name generally given to certain dome-shaped buildings in Ireland, which are believed to be among the oldest architectural remains in that country. They are round edifices, of no great size or height, built without cement, of long thin stones arranged in horizontal layers, the one slightly overlapping the other, and so gradually converging until they meet at the top. The doorway, which is square-headed, is somewhat narrower at the top than at the bottom, as in Egyptian architecture. Beehive-houses are of two kinds—single or clustered. The former are generally found beside ancient oratories, and are supposed to have been the dwelling-places of the priests; the latter, which are often underground, shew two or more hive-shaped chambers, connected by a passage or gallery, or opening from a larger central apartment, which is also hive-shaped. Irish antiquaries refer the beehive-houses generally to the period before the Anglo-Norman invasion of the island, in the 12th c., and claim for some of them an antiquity as high as the 7th and 8th c. Ruins of single beehive-houses are found in the Western Isles of Scotland; and some of the 'Picts' houses,' or 'earth-houses,' of the east coast, seem to resemble the subterranean aggregated beehive-houses of Ireland.

BEELZEBUB (i. e. 'the god of flies'). Under this name the people of Ekron, in Philistia, worshipped their god Baal (q. v.) or Bel. The Greeks also had their 'Zeus Apomyios' or 'Myiagros'—'the disperser of flies.' As the heathen deities were all regarded as demons by the Jews, the name Beelzebub became, in course of time, commonly applied to the chief of evil spirits, and in this sense it is employed in the Gospels. The more correct reading of the word, as given by the Evangelists, is BEELZEBUL—an opprobrious change of name, making it signify 'god of dung,' to mark the low and grovelling character of the demon. See BAAL.

BEER, derived from the German *B* [illegible] A the term applied to a fermented liqu[illegible] not undergone the process of distillation. [illegible] prepared from many varieties of vegetable [illegible] but in Britain the raw material operated generally barley, although pease, beans, [illegible] might be employed. In other countries, [illegible] prepared from other sources, to which [illegible] made at the close of this [illegible] followed in the manufacture [illegible] is [illegible] two parts—viz., *malting* and [illegible] tinct are these, that very [illegible]

in a building at some distance from that in which the brewing is conducted, and in many cases the malting is superintended and accomplished by a *maltster*, as his particular and only branch of trade, the malt thus prepared being afterwards purchased by the brewer.

The variety of barley preferred for the preparation of the finer kinds of B. is the chevalier; but other varieties are extensively used. See BARLEY.

The process of malting, or the conversion of barley into malt, is accomplished in four successive steps. 1st, *Steeping* of the barley, which consists in

Fig. 1.

introducing the grain into a large wooden or stone cistern, *a* (fig. 1), and adding thereto as much water as will cover it. On being thus treated for twenty-four hours, the grains of barley absorb the water, and the contents of the cistern, near the top, even begin to feel dry. The barley swells up much, so as to increase considerably in bulk, and the Excise officers, if they choose, can gauge or measure the grain at this stage, and charge by the bulk thus indicated. The amount of water which barley takes up in the steeping, affords good evidence of the excellence of the grain for brewing. Thus, the better kinds of barley, on the average, take up sufficient water to increase their weight by one half. Occasionally, however, the increase is not more than a tenth. The time during which the grain lies in the steeping-cistern is about 40 hours, when the excess of water is drained off; but a regulation exists that the cistern cannot have a second charge of barley till four days have elapsed after the introduction of the first charge. 2d, *Couching*.—The grain is thrown out of the steeping cistern in a heap on the floor, *b*. At this stage, the barley is soft, and when pressed between the fingers, it is readily bruised. It lies in the couch or heap for 26 hours or so, and during that time, it rises in temperature about 10° F., and gives out some of its extra water. This *sweating*, as it is called, is the result of the partial germination or growth of the barley; and little rootlets or fibrils of the radicle, and a primitive stem (plumula or acrospire), begin to form and present themselves. As the temperature rises, the radicles lengthen rapidly, and means are then taken to check the germination. 3d, *Flooring*. The heated barley is spread by the workmen with spades on the floor to the depth of about 15 inches at first, *cc*. It is repeatedly turned and respread over a larger area, with a thickness of layer decreasing to 6 inches. At this stage, the radicles have attained their greatest length. 4th, *Kiln drying*.—The half-germinated barley is now introduced into a kiln (fig. 2), on the perforated floor of which it is spread. The apartment beneath the kiln room is fitted up with stoves or choffers, A, which evolve much heat; and this, rising and passing through the slits or perforations in the floor of the kiln, B, necessarily dries any moist barley laid thereon, and the steam escapes at the roof, C. The heat which the barley is subjected to in the kiln is, at the commencement, 90° F., but this gradually is raised to about 150° F. While drying, the radicles—called *corculums*

Fig. 2.

or *cummings*—break off from the grain, and are afterwards removed by a wire-sieve. The colour which the barley assumes as it becomes dry malt in the kiln is determined by the heat to which it is subjected, the higher temperature yielding the darker-coloured malt. *Pale* and *amber coloured malt* are used in the brewing of the lighter varieties of B.—such as bitter-B., table-B., and small-B.; whilst a darker kind of malt is used in sweet ale, and a very dark malt in the preparation of porter. During the conversion of barley into malt, a loss of material occurs. Thus, 100 parts of barley yield 80 parts of malt; but as the 100 parts of barley contain 12 of water, it follows that there are present only 88 parts of dry matter, and these yield 80 parts of dry malt, giving a loss of 8 per cent. of the original weight of the barley. While there is a decrease in weight, there is an increase in bulk, 100 measures of barley becoming 101 to 109 measures of malt. Certain chemical changes likewise occur as the barley is

transformed into malt, which may be noticed from the following table:

	Composition of Barley.	Malt.
Hordein (q. v.), .	55	12
Starch, . .	32	56
Sugar, . .	5	15
Gluten, . .	3	1
Gum, . . .	4	15
Resin, . .	1	1
	100	100

The principal chemical change is, therefore, the transformation of much hordein (a form of starch) into starch, gum, and sugar. The mechanical condition of the contents of the grain is also altered; the grain is now of a fine mealy nature, and is readily broken between the fingers, when the flour in the interior is found to be soft and distinctly sweet to taste.

The *brewing* of the malt comprehends no less than six stages. 1st, *Grinding the malt*, which may be accomplished in several ways: either by placing the malt between two revolving horizontal circular stones, such as are employed in flour-grinding; or passing the malt through a mill like a large coffee-mill; or bruising it between revolving steel rollers. The last plan is the best, as it is desirable that the grinding should not be too perfect. It would give a fine flour, readily becoming [illegible] the addition of water. When coarsely [illegible] however, the water can find its way into all of the grain, and thoroughly soak it. 2d. [illegible] *the bruised malt.*—This operation is conducted in a large tun (fig. 3), built up of wooden staves, and surrounded by hoops—somewhat similar in construction to an ordinary domestic churn. Water, which has been previously heated in a copper, is allowed to run into the comparatively cold mash-tun, while the bruised malt at the same time

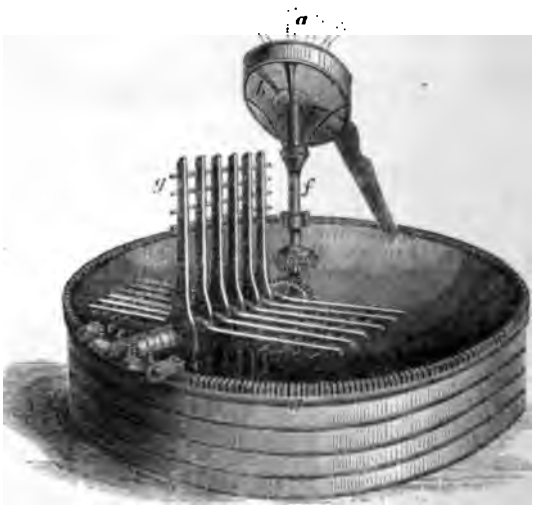

Fig. 3.

descends by the hopper, *ab*; the water thereby becoming reduced to 160° F., or slightly below that temperature. The whole is then thoroughly agitated by long poles, *g*, worked by the hand or by machinery, *def*, till every particle of the malt is brought into contact with the water. The result is that the malt absorbs the water in part, and a very active change begins to take place. In the malt, there is developed a substance called *diastase* (q. v.), which reacts on the starch of the malted barley, and changes it into the variety of sugar called grape-sugar. See SUGAR. So rapidly does this transformation of starch into sugar occur, that almost immediately on the mixing of the water with the bruised malt, the liquid assumes a sweet taste. In the space of half an hour the temperature of the mash-tun will be found to have decreased to about 140° F.; and then a second quantity of water, at a heat of 190° F., is run in, so as to raise the temperature to about 167° F., which degree of heat is found to be the best for enabling the diastase to act most powerfully in transforming the starch into sugar. After two to three hours' action upon the malt, the water, which is now very sweet to the taste, is drawn off into a large vessel called the *underback*, and fresh water, at a temperature of about 190° F., is admitted to the tun, and allowed to soak the malt still remaining there. This part of the process is styled the *second mash*; and as the water is at a higher temperature than in the *first mash*, much of the residuary matter in the mash is changed into sugar, and dissolved. After some hours, the liquid from the second mash is drawn off, and added to that of the first mash already in the underback; and a third quantity of water, at a still higher temperature, about 200° F., is run in upon the malt, which dissolves out all the remaining portions of any value, and leaves the husk skin of the grain and other insoluble matters. The liquid from the *third mash* is not strong enough to be in general mixed with the other solutions in the underback, and is either employed in brewing small-B., or is again heated and used in treating new bruised malt.

In order that the brewer may be enabled to prepare the same variety of B. day after day, it is requisite that the liquid in the underback, and which is now called the *sweet-worts*, should be of a definite strength; and to determine this, an instrument called a saccharometer, a form of *areometer* (q. v.), is used, which enables the brewer to determine the strength of the sweet-worts, and, if necessary, to add some of the liquid from the third mash, to reduce the strength of that in the underback.

In the drawing off of the several worts from the

mash-tun, advantage is taken of a finely perforated false bottom of plate-iron, which lies about a foot above the true bottom of the tun, and the liquids being drained away through the perforations in the false bottom, the insoluble husk and other matters are left behind. The material left on the false bottom, called *grains* or *draff*, is used for feeding cattle.

3d, *Boiling of the worts with hops.*—When reduced to the proper strength, the worts are pumped up from the underback into a covered-in boiler or copper, AA (fig. 4), and being mixed with hops, are raised to the boiling-point, and kept in a state of ebullition for some time. During the boiling, it is necessary to keep the hops and other sediment from settling at the lower part of the boiler near the fire, DD, and for that purpose, a sort of rake with teeth, BB, turned by a wheel (C) above, is kept turning round, which tends to hold the sediment in mechanical suspension. To economise heat, it is customary to have a tank fitted to the upper part of the boiler in which water or the worts can be heated. The

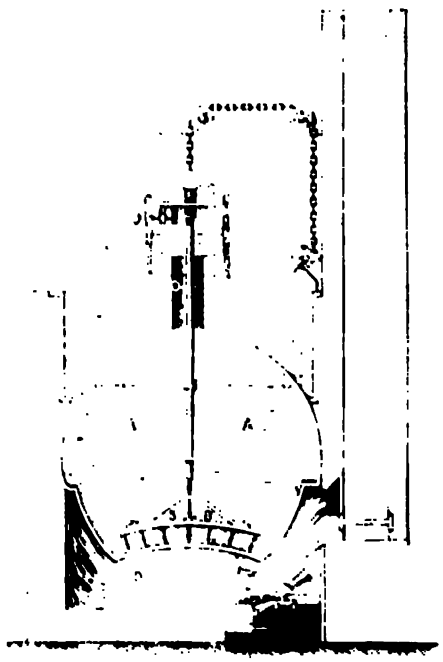

Fig. 4.

hops which are obtained from Kent and Sussex are the strongest, and are employed in the brewing of porter, while the Worcester hop is milder, and is preferred for ale. The hops are useful in the brewing of B. in imparting to the liquor a volatile fragrant aromatic oil, a bitter resin, and a little tannin. The quantity of hops required to be added depends much on the kind of B. which it is intended to brew. The stronger the B. is to be, and above all, the more bitterness is required, the more hops must be added to the boiler. In common ale or B., the quantity of hops does not exceed 2 lb. to the quarter of malt; whilst in bitter-B., and especially that intended for foreign countries, the amount of hops is 8 lb. and upwards. Besides imparting to the worts the active constituents of the hop, the boiling operation serves other important ends. In the sweet-worts, there is a considerable quantity of nitrogenous matter, which is very liable to pass into decomposition, and which, were it to do so, would destroy the beer. During

Fig. 5.

the boiling, the excess of this nitrogenous matter separates as a flaky and stringy solid, called by the brewer *mucilage*. The boiling is continued till the hops have yielded their aromatic and bitter principles, and till the liquid has been concentrated to the extent required by the brewer, and then the whole is run into the *hop-back*, a form of cistern which has a false bottom composed of perforated iron plates (fig. 5), admitting of the liquid worts percolating through, while all the mucilage and other solid matters are retained on the upper surface of this metallic sieve. 4th, *Cooling the worts.*—As the liquor drains through the false bottom of the hop-back, it is run on to the *cooler* or *refrigerator* (fig. 6), which, in size and appearance, resembles the ordinary wooden floor of a large room. The planks are so closely connected together that the liquid cannot run through, and a wooden ledge, B, runs round the sides of the room, which is also tight. The hot worts, which are spread to the depth of a few inches over the floor, are very rapidly cooled down, by allowing a free current of cold air to pass over the top of the liquid, and often by having a series of fans, CC, revolving rapidly immediately above the liquid, so as to cause a more speedy removal of the heated air loaded with steam, and the substitution of cold air. Occasionally, the brewer is at the expense of having a coil of metal pipe, A, placed up and down the floor of the cooler, through which metal pipe cold water is allowed to run at the time the hot worts are being cooled down. By these means the worts are very soon reduced to a temperature of about 60° F. This step in the process of brewing is a very important one, as, if the cooling is not conducted with the greatest rapidity, the sugar in the worts

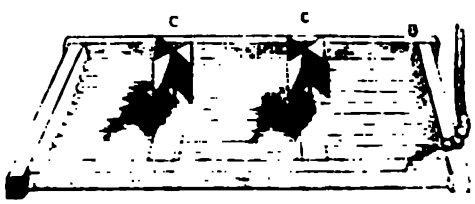

Fig. 6.

will become partially converted into acetic acid, or, as it is termed, *foring* occurs, which communicates bad properties to the worts, and ultimately produces a beer with an unpleasant taste and flavour.—5th, *Fermenting the worts.*—When the

liquid has been cooled down to 55°—60° F., it is conveyed to the fermenting tun, where it is mixed with the yeast (q. v.), and the process of fermentation proceeds. The tun or vat is formed of strong wooden staves, and is either circular or square. The latter form has recently been introduced, and appears to be preferred by some brewers. The yeast is added in varying quantity, according to the strength of the worts, but the more common amount is one gallon to every 100 gallons of the worts. Very soon after the yeast is mixed with the worts, the whole contents of the tun begin to pass into a state of commotion, much gas is evolved, and this, tending to escape, causes a *frothing* on the surface of the liquid termed the *rocks*, from the irregular mountainous appearance of the masses of froth piled on each other. The colour of the froth at this period indicates the quality of the beer. Thus, if the froth appears of a yellowish-white or yellow tint, the operation is going on satisfactorily; but if the colour darkens to a brownish-yellow or a light brown, it is considered a bad sign, and the beer is spoiled as a first-class beverage. The chemical changes which occur during the process of fermentation (q. v.) are due to the action of the particles of yeast on the sugar or saccharine matter. This action proceeds most satisfactorily at a temperature of 72° F., and care is taken in the brewing of the finer varieties of beer, such as India pale ale and bitter-beer, that the temperature never exceeds 72° F. The grape-sugar which is present in the worts as they are introduced into the fermenting tun, is composed of carbon, hydrogen, and oxygen in the proportion C_{12}, H_{14}, O_{14}; and when the yeast acts upon it, a greater or less proportion of it is converted into alcohol, carbonic acid, and water. Thus, one atom of sugar, $C_{12}H_{14}O_{14}$, is converted into 2 atoms of alcohol ($C_4H_6O_2$) $= C_8H_{12}O_4$; 4 atoms of carbonic acid (CO_2) $= C_4O_8$; and 2 atoms of water (HO) $= H_2O_2$; which, when added together, give the atom of sugar, $C_{12}H_{14}O_{14}$. The carbonic acid tending to escape, causes the frothing or rocks, and the alcohol and water are left in the fermenting tun. During the progress of the fermentation, a considerable amount of new yeast is formed, which gets entangled in the froth; and when the operation slackens, and the frothy head begins to fall, the upper yeast is skimmed off. This process of the conversion of the sugar of the worts into alcohol or spirit, is termed attenuation (Lat. *tenuis*, thin); and the degree to which the change is carried depends on the kind of B., and the market it is to be sent to. In sweet ale or B., the attenuation is not allowed to proceed far, and much sugar is left in the beer. Bitter-B., however, is attenuated to a greater degree, and consequently there is less saccharine matter left in it; while in India pale ale, and other beers intended to be sent great distances, the attenuation must be carried on much further, else the liquor would not be preserved during its transit to many parts of the globe. 6th, *Clearing* and *storing*.—The B., when properly fermented, is placed in casks like hogsheads, called *rounds*, where the remaining traces of fermentation proceed, and the B. ceases to appear thick or cloudy, and becomes clear; when it is pumped up into store-casks of great size, or at once placed in the casks in which it is sent into market. During the storing of the B., an extra quantity of hops is often added, to increase the bitterness and pungency.

The principal constituents of the various kinds of B. are water, alcohol, sugar, gum, gluten, and the bitter extractive matter of the hop. The amount of alcohol varies: in small-B., it is only about 1 per cent.; in ale, the stronger kinds of B., and porter for home consumption, 5 to 7 per cent.; in East India pale ale, 10 per cent. In B. intended to be forwarded to California from Britain, the attenuation is carried so far, that there is more than 10 per cent. of alcohol, and the B. is then called *dry*.

B. is adulterated in many ways. Burned sugar (caramel) is added to give colour; cocculus indicus, to supply an intoxicating agent which will give an appearance of strength to the B.; quassia, to impart bitterness in place of hops; grains of paradise and Cayenne pepper, to communicate pungency; coriander and caraway seeds, to yield flavour; liquorice, treacle, and honey, to supply colour and consistence. To stale-beer there is sometimes added green vitriol (sulphate of iron), or alum and common salt, which, when agitated with the B., communicate a fine cauliflower head. It is unnecessary to state that such admixtures are never made in any extensive brewing establishment with respectable connections.

For the home-brewing of B., many recipes have been published, and one of the best is that given by Mr Donovan in the *Cabinet Cyclopædia*. The apparatus he suggests is of the roughest description, and comparatively inexpensive. A porter-barrel forms the mash-tun; the upper end being taken out, perforated with a gimlet, and lowered into the barrel to near the bottom, where it is supported about a couple of inches from the true bottom, and constitutes the false bottom through which the liquid drains from the bruised malt. A hole is made in the side of the barrel, near the bottom, and between the true and false bottoms, which can be plugged up with a spigot when not required to let the liquor run off. A second porter-barrel will be useful as an underback and fermenting tun. An ordinary household boiler, or a large common tin-plate one, will answer the purpose of boiling the worts. The mash-tun is first well scalded with hot water, and then is supplied with 15 gallons of boiling water and 5 gallons of cold water at 60° F., 2½ bushels of first-class bruised pale malt are shaken in, and well stirred through the water, the top of the barrel being in greater part closed with a thick cloth. In an hour or so, the liquid which is in the tun will be clear when allowed to run out at the spigot-hole; and immediately after it ceases to run, about 20 gallons of nearly boiling water are run over the half-exhausted malt, and this carries off all the soluble matters, yielding altogether about 23 gallons of sweet-worts. These are placed in the copper, 3¼ lb. of the best mild hops are added, and boiled for 20 minutes. The liquor is then strained through a fine sieve into the fermenting tun; and when it has cooled down to below a blood-heat (96° F.), a quart of yeast is added, and the fermentation allowed to proceed. When the frothy head begins to droop, the upper yeast is skimmed off, the liquor put in a cask, bunged up, and allowed to clear for a fortnight, when it will be ready for use.

The foregoing remarks on the manufacture of B. apply to all the varieties of B., ale, and porter (q. v.) brewed and used in Britain. The liquor may differ in strength, from difference in the quantity of water, or in colour, from the malt being more or less charred in the kiln-drying. There are, however, many other varieties of beer. In South America, the Indians prepared and drank a B. obtained from Indian corn, and called *chica* or maize B., long before the Spanish conquest. The process followed in making chica is similar to that of B.-brewing in Britain. The maize is moistened with water, allowed partially to germinate, and dried in the sun. The maize malt so prepared is bruised, treated with warm water, and set aside till the fermentation is over. The chica or maize B. has a yellow colour, and a pleasant acid taste. In the valleys of the Sierra, the maize malt is chewed

between the teeth of the Indians and their households, and the chewed morsel incorporated with the saliva is put in jars with hot water, when the fermentation proceeds more rapidly than before, and a more highly-prized B. is obtained. The chica is also made from barley, rice, pease, manioc, pine-apples, and grapes. The Crim Tatars prepare a B. from millet-seed, called *bouza* or millet-beer. The same seed is used in Sikkim, on the southern slopes of the Lower Himalaya, and yields B. there called *murwa*. The Arabians, Abyssinians, and many African tribes, employ *teff*, or the seeds of *Poa Abyssinica*, and millet-seed, as sources of beer. The Russians prepare a B. from rye called *quass* or *rye-beer*. The Tatars ferment milk into *koumiss* or milk-beer. The Arabians use the milk to yield their *leben*, and the Turks to produce their *yaourt*. In the north of Scotland, the Orkneys, and some parts of Ireland, buttermilk, or *sour-milk*, is allowed to stand till fermentation begins, and an intoxicating liquor results. The South-sea islanders prepare a B. from the root of *Macropiper methysticum*, or *the intoxicating long pepper*, which is called Ava (q. v.).

The successful brewing of B. depends much on the kind of water employed. The water which is found most suitable contains much common salt, sulphate of lime, and carbonate of lime, in a state of solution. The waters employed in the most extensive breweries contain at least 60 grains of earthy salts dissolved in each imperial gallon. Great care must be taken to select water which not only has the proper amount of saline ingredients, but at the same time is free from organic matter either of animal or vegetable origin. Water containing such is liable to the decomposition and putrefaction of its constituents, and by contamination, causes the B. prepared by means of it to be more liable to go wrong in the brewing, and to possess ultimately an unpleasant taste.

The employment of B., especially of that variety known as Bitter B., has recently rapidly advanced in public estimation as a beverage and article of diet. Bitter-B. acts as a tonic and slight stimulant, and in many cases it is recommended by medical men to convalescents in place of wine. Some statistics regarding the consumption of the different kinds of B., and other kindred beverages, will be found under FERMENTED AND DISTILLED LIQUORS.

BEER ACTS, the 11 Geo. IV. and 1 William IV. c. 64, the 4 and 5 William IV. c. 85, and the 3 and 4 Vict. c. 61, amended by the Wine and Beer-house Acts, 32 and 33 Vict. c. 27, 33 and 34 Vict. c. 29, and the Intoxicating Liquor Acts, 35 and 36 Vict. c. 94, 37 and 38 Vict. c. 49. By the earlier of these acts (all relating to England), every householder assessed to the poor rates in any parish or place (and not being a sheriff's officer, or officer employed to execute judicial process), could, without any licence from the magistrates, apply for and obtain an Excise licence, to enable him to sell beer and cider, by retail, at some house situate within such parish or place, and specified in such licence. But in order to obtain such licence, the applicant must produce an overseer's certificate that he was the real resident, holder, and occupier of such house, and rated to the poor-rate in a certain amount; and must enter into a bond with one sufficient surety, in the penal sum of £20, or two sufficient sureties in the penal sum of £10 each, for the payment of such penalties as he may incur under the acts; and if he is also desirous for permission that the liquor should be drunk *on the premises*, he must, moreover, annually deposit with the commissioners of Excise (now the Board of Inland Revenue), or other person authorised to grant the licence, a certificate 'of good character,' signed by six rated inhabitants of the parish, of whom none shall be maltsters, common brewers, or licensed publicans, or owners of licensed public-houses. These requirements were easily evaded as regards the evidence of good character, and in 1869 the new practice was introduced by the Wine and Beer-house Act, 32 and 33 Vict. c. 27, of not only requiring the house to be of a certain valuation, but the applicant to go first to the justices of his division or borough for a certificate, which thus enabled some inquiry to be made into the respectability of the persons keeping beer-houses. This certificate of justices, sometimes also called a justices' licence, is indispensable before getting an Excise licence. It is, moreover, required that every person obtaining a licence shall paint conspicuously over the door of his premises, in such form and manner as the acts specify, his Christian name and surname at full length, and the words 'licensed to sell beer (or cider) by retail,' with the addition of 'to be drunk on the premises,' or 'not to be drunk on the premises,' as the case may be. Penalties are also imposed on every retailer of beer or cider who shall transgress, or allow to be transgressed, any of the numerous and stringent provisions of the Licensing Acts 1872-4. The licence to sell beer is confined to that particular privilege; and persons, under cover of it, attempting to sell wines or spirits, are not only liable in a heavy penalty, but may be deprived of their beer licence. On the other hand, a licence to sell wines and spirits is quite distinct; but all Excise licenses to retail liquors must be preceded by a justice's certificate.

The Wine and Beer-house Acts of 1869 and 1870 still mainly govern the qualifications of those who sell beer by retail, and a similar law is applied to those who sell wine and liqueurs by retail in refreshment houses. The law was, however, deemed imperfect as regards the offences which the keepers of licensed houses are prone to commit, and it required the Intoxicating Liquors Licensing Act of 1872, c. 94, and of 1874, c. 49, to create more uniformity as well as stringency in the requirements. During Sundays, all licensed houses require to be shut except between 12½ or 1 P.M. and 2½ or 3 P.M., and between 6 P.M. and 10 or 11 P.M., the justices having a slight power to vary these hours. A fixed time of opening and closing is also prescribed for week-days. When a keeper of the house is convicted of an offence, it is usually indorsed on his licence, and after three indorsements he forfeits the licence; and, in some cases, even the landlord's power to relet the house for the sale of liquors is suspended for some years, according to the nature of the offences. Though the houses are closed for part of Sundays, yet travellers and lodgers are exempted in most cases, and can be supplied as usual with liquors. Some of the penalties have been admitted to be too severe, and require modification.

The place where beer is exclusively sold is called a *beer-house*, differing in this respect from an *ale-house*, which means a place where other liquors as well as beer are retailed. The term *public-house* applies to the second most frequently.

The sale of beers or ales in Scotland is regulated by the act 25 and 26 Vict. c. 35, amending the act 9 Geo. IV. c. 58, and the 16 and 17 Vict. c. 67, commonly called the 'Forbes Mackenzie Act.' Justices and magistrates meet twice a year to grant certificates. By the form of licence thereby prescribed, no liquors of any kind can be sold on Sunday in any inn, hotel, shop, or any public-house, except to lodgers and travellers. In the English acts, the words '*bond-fide* travellers' are used, which mean the same thing, and they are held to include persons travelling two or three miles for business or

pleasure. Many of the penalties of the act 25 and 26 Vict. c. 35 exceeded those of the English acts, but the English act of 1872 far outstripped in stringency (except as regards Sunday) the Scotch acts.*

BEER, J. MEYER. See MEYERBEER.

BEERBHOO'M, or BIRBHOO'M, a district in the presidency of Bengal, with an area of 1344 square miles, and a pop. (1871) of 695,921. It extends between N. lat. 23° 32′ and 24° 40′, and between E. long. 86° 25′ and 88° 30′. Though part of B. is within 80 miles from Calcutta, yet little is known concerning it. The inhabitants are represented as generally a rude race, and there appear to be hardly any places worthy of the name of towns.

BEER-MONEY was a peculiar payment to non-commissioned officers and soldiers in the English army. It was established in the year 1800, at the suggestion of the Duke of York, and consisted of one penny per day for troops when on home-service, as a substitute for an issue of beer and spirits. It continued as an addition to the daily pay until 1873, when, the stoppages for rations having been abolished, the opportunity was taken to consolidate Beer-money and pay proper.

BEE'RSHEBA, or BIR-ES-SEBA ('well of the oath,' or 'well of the seven'), so called because here Abraham entered into an alliance with Abimelech, king of Gerar, which he ratified with an oath and a gift of seven ewe lambs. B. was situated on the southern border of Palestine, about 52 miles south-west from Jerusalem, and formed the limit in that direction of the Israelitish dominion. It was one of the most ancient as well as one of the most interesting places in sacred record. While Abraham resided at this place, he received the command to sacrifice Isaac, whose residence it also was. Esau was robbed of his birthright and blessing here, and here Jacob sacrificed to God before departing into Egypt; the sons of Samuel were made judges here, and it was from hence that Elijah was forced to flee into the desert from Jezebel's wrath. After the captivity, B. was occupied for some time by the Jews, and in the 4th c. A.D., it was a Roman garrison. Afterwards, the Crusaders are said to have fortified it, and to have regarded it as a place of importance. Two circular wells of fine pure water—the largest being 44 feet deep to the surface of the water, and 12½ feet in diameter—and a heap of ruins about half a mile long and a quarter broad, remain to mark the place where B. once was.

BEE'SHA, a genus of grasses with the habit and most of the characters of bamboos, but remarkable for the fleshy pericarp which encloses the seed, forming a sort of berry. The species are few, natives of the East Indies.

BEES-WAX is principally obtained from the ordinary bee-hive, where it is elaborated by the workers. See BEE. For some time, it was matter of dispute whether the bees really manufactured the wax from other ingredients in their food, or if they performed the simple task of carrying the wax ready made from the plant to the hive. It appears now to be definitely settled, that while, in ordinary circumstances, bees may derive part of the wax from plants, yet, when they are fed entirely upon pure sugar, they continue to elaborate wax, and to build up the walls and partitions of the honey-comb. The wax procured from British hives is considered the purest and best, but the smallness of the amount necessitates the importation of comparatively large quantities from North America, Brazil, Singapore, Ceylon, Gambia, and Mogadore. British B. is naturally of a yellow colour, whilst that procured from foreign countries is darker in tint; and in the case of the wax from Brazil, which is yielded by a species of black bee living under ground, the colour is a dark mahogany, and the material is soft and tenacious. In the separation of the honey from the wax, the honey-comb is subjected to pressure, which squeezes out most of the honey; the residual comb is then treated with water, and heated, with constant stirring, till the wax melts, when the whole is passed through hair-bags. The wax is received in a vessel of cold water, where it is at the same time washed, and cooled down till it solidifies, as a thick cake, on the surface of the water. For many purposes, it is necessary to bleach the wax, and the common method is to obtain it in thin sheets or ribbons, by melting it under water, and pouring it upon horizontal wooden cylinders, which are kept revolving half immersed in water in a perforated vessel. The sheets or ribbons of wax so obtained are laid out upon a field with a southern aspect, and being repeatedly watered, are subjected to the joint action of the sun's rays, the ozone of the air, and moisture. In a short time, the wax loses its yellow tint, and becomes white. Attempts have been made to perform the bleaching more expeditiously by employing chlorine, bleaching-powder, and other chemical agents. The only process which appears not to injure the wax is to melt it, and for every pound add two ounces of pulverised nitrate of soda, and one ounce oil of vitriol, diluted previously with eight ounces of water. While the latter is gradually poured in, heat is applied, and the whole mixture swells up, necessitating the employment of a capacious vessel. On cooling, the wax gathers on the surface, and being repeatedly treated with hot water, to wash away impurities, is finally allowed to solidify in a cake.

Purified B. has a density of 960 to 966, and is therefore lighter than water, which is taken as 1000. In thin slices, it is translucent, and is tasteless, odourless, and colourless. At 32° F., it is hard, brittle, and solid. When heated to 85°—90° F., it softens, and can then be kneaded between the fingers like moist dough or putty, and at 145° F. it fuses, and becomes a true liquid. It is insoluble in water, and is partly soluble in boiling alcohol, and partly not. The alcoholic solution, which takes up about 80 to 90 per cent. of the wax, contains principally a substance called *cerine*, which separates in crystals as the solution cools, and *cerolein*, which remains dissolved in the cold alcohol. The matter which resists the solvent action of the alcohol is a substance called *myricin*. B. is largely used in the manufacture of wax-candles and tapers; and though it has recently been very much excluded from the manufacture of ordinary candles, from the readiness with which first-class composite candles can be made indirectly from tallow, yet it is often used as one of the ingredients in composite candles to impart hardness to the manufactured article. The very large candles used in Roman Catholic countries for church-services, are always made of wax alone.

BEET (*Beta*), a genus of plants of the natural order *Chenopodiaceæ* (q. v.), distinguished by a 5-cleft perianth, five stamens inserted on a fleshy ring surrounding the ovary, and the fruit adhering to the calyx, and collected in clusters of two or three. The species are not numerous; they are

* A shebeen is the name given in Scotland to a house or place where liquors are sold without a justice's or Excise certificate. Every person found in such a place, drinking or drinking, may be taken before a justice, or detained in a police-station till this can be done, and he may then be fined ten shillings, or, in default, imprisoned ten days.

mostly bienniala, with smooth, ovate, stalked root-leaves, and tall, leafy, flowering-stems. They are natives of the temperate parts of the Old World. The Common B. (*B. vulgaris*) is a native of the shores of the Mediterranean, but is now in very general cultivation both in fields and gardens, chiefly for the sake of its large succulent and generally carrot-shaped roots, which are used as food both for man and for cattle, and from which also sugar is largely extracted on the continent of Europe. Beet-roots may be substituted for malt, when deprived of the greater part of their juice by pressure. The variety chiefly cultivated in gardens is known as Red B., from the colour of the root, which also more or less appears in the leaves and leaf-stalks. The subvarieties are very numerous. In some, the root is rather turnip-shaped than carrot shaped, and the size and colour also vary much, some being of a deep blood-red, or even almost blackish colour, both externally and internally; and others of a much lighter red, and internally, even white. It forms a favourite pickle, and is also very agreeable as a boiled vegetable when properly dressed. The seed is sown so late in spring, that the plants may not produce flowering stems the first year, which, when it occurs, renders the root fibrous and useless. - Mangold-wurzel (q. v.), so valuable as a field-crop for food of cattle, is, in general, regarded as merely a larger and coarser variety of the common B., in which the red colour is comparatively little exhibited, although some botanists have, on very slender grounds, endeavoured to erect it into a distinct species. The White B. of our gardens (*B. cicla* of some botanists) is now also generally supposed to be a mere variety of the common B., with little or no red in its roots or leaves, and a comparatively slender root. It is cultivated for the sake of its leaves, which are used in the same manner as spinach, and form an excellent substitute for it, especially in the beginning of spring. The leaf-stalks and midribs (*chards*) of the leaves, especially of a variety in which these parts are unusually developed, are also dressed for the table.—Sea-B. (*B. maritima*) grows wild upon the shores of Britain, and differs from the common B. in its perennial root, its partly prostrate stems, and other characters. The leaves are used for food in Ireland, as are also those of *B. Bengalensis* in the East Indies.

BEET-FLY (*Anthomyia Betæ*), an insect which infests crops of mangold wurzel, and other kinds of beet, depositing its eggs on the leaves, the soft parts of which the larvæ devour, causing them to assume a blistered appearance, and when numerous, injuring the health of the plants. It is a two-winged insect (see Diptera), of the great family *Muscidæ*, of which the common house-fly may be regarded as the type, and belongs to a genus of which more than 100 British species are known, the larvæ of some of which are well known as feeding upon the roots of cabbages, turnips, &c. See Cabbage Fly, Turnip-Fly, and Potato-Fly. It is not so large as the common house-fly.

BEETHOVEN, Ludwig van, the unrivalled composer, whose works have made a new epoch in the development of music, was born at Bonn, December 17, 1770, and died in Vienna, March 26, 1827. His father, a tenor-singer in the elector's chapel at Bonn, began to cultivate the genius of his son when only five years of age. He next placed him under the court-organist, Van Eden, and shortly after under the composer Neefe. In his eighth year he created astonishment by his performance on the violin; when only eleven, he played the music in Bach's *Wohltemperirtes Klavier*; and in his thirteenth year he published, at Manheim, a volume of variations on a march, songs, and sonatas. In 1792, he was sent to Vienna by his patron, the Elector of Cologne, to enjoy the instructions of Haydn, who first made him acquainted with the works of Handel. He also studied composition under Albrechtsberger. There he soon attracted notice by his extraordinary ability as an extempore player of fantasias, and also by some compositions, which, however, did not escape the censure of critics. He became so much attached to Vienna, that, after his patron's death in 1801, he determined to remain, and declined an invitation to England. In 1809, when another offer tempted him to leave Vienna, several friends of music, with the Archduke Rudolf at their head, raised a subscription to provide for the composer a pension sufficient to retain him. At Vienna, therefore, he stayed during the remainder of his life, secluded from the world, of which he knew as little as it knew of him; and in later years, still more isolated from society by a defect of hearing, which gradually became confirmed into entire deafness. In this sad inviolable solitude, he produced his new symphonies, his sublime overtures, his quintetts and quartetts, so full of profound conceptions and mysterious revelations of the highest harmonies, and his pianoforte sonatas, which express, sometimes, a peculiar train of feelings, at other times appear to represent his own recluse character. Shut out in a large measure from the ordinary pleasures of life, ignorant of the sweetness of married life, and able to enjoy only in a slender measure social intercourse, he retired for compensation into the world of his own imagination, and brought forth from its deep resources those treasures of harmony which, though at first received with a shy astonishment rather than a cordial admiration, are now ranked among the works of art which cannot die. These new forms and original creations, which display B.'s majestic powers in music, were only gradually developed; in his early productions, he submitted to established forms of composition.

The works of B. may be divided into three classes, or may be assigned to three distinct periods of his intellectual development. All the works of his first period, though important, shew the influence of his teacher Haydn, or of his more highly esteemed model, Mozart. This period of composition may be said to extend to his 16th orchestral work, including, besides several pianoforte sonatas, trios for pianoforte and for stringed instruments. All these early works display the highest cultivation of the forms and principles of art previously established in the Viennese school of music. - The second period of B.'s artistic life, in which his genius was completely self-reliant, extends from the 16th to the 80th work. This was certainly the most productive and brilliant part of his career. To it belong his greatest creations, his magnificent and powerful orchestral works symphonies, overtures, &c. - all of which display the highest qualities of imaginative composition. Besides the great orchestral works, it includes many sonatas for pianoforte, and various compositions of chamber-music—septetts, quintetts, quartetts, trios, serenades, &c. In dramatic composition, B. produced only one opera, but this was *Fidelio*, the first truly German musical work of a dramatic character. This was the result of great study, and, as it is now given, is the reconstruction of an earlier composition. Other dramatic pieces are - the overture, interludes, and melodramatic music in Goethe's *Egmont*, and the instrumental music and choruses in the *Ruins of Athens*. In the third and last period of B.'s career we find those two gigantic works, the *Missa Solemnis in D Minor*, and the ninth symphony (D minor) with chorus. These works transcend

all common laws and forms, and belong to the highest sphere of art. Their deep mysteries can be apprehended only by those who have deep emotions and profound technical knowledge of music. Other works of this last class approach those just mentioned, though they do not reach the same elevation. But all are alike in passing far beyond the ordinary traditional forms of art. All are pervaded by an impulse as of inspiration. Among these works may be mentioned, the great quartetts for bow-instruments (mostly published after the death of B.), the grand overtures—works 115 and 124—and several sonatas for pianoforte, especially that in B♭ major.

The life of B. has been written by Schlosser (Prag. 1828), Ries, Wegeler, Schindler (Münster, 1845), and Moscheles (2 vols., Lond. 1841).

BEETLE, a name popularly applied to many kinds of coleopterous insects. It is never extended to insects of any other order, and it is sometimes used in works on natural history as a common name for all coleopterous insects; but this makes it to include many kinds to which it is not popularly applied, as fireflies, lady-birds, weevils, cantharides, &c. It is also employed by some authors in a more restricted sense, as a designation of the insects forming the large tribe *Scarabæides;* but the restriction, equally with the extension, is an interference with the popular use of the English word, of which, however, the limits are very uncertain. To frame an article, with strict regard to that popular use, and at the same time to science, would not be easy, nor would it be profitable, as the assemblage of kinds would be not only large, but very miscellaneous. We think it better to refer to the article COLEOPTERA, and to the articles SCARABÆIDÆ, BOMBARDIER BEETLE, STAG BEETLE, BURYING BEETLE, GOLIATH BEETLE, ROSE BEETLE, &c. The name BLACK BEETLE is often given to the COCKROACH (q. v.). See also BLAPS.

BEETLE-STONES, the name given by the lapidaries of Edinburgh to hard nodules of clay ironstone, found abundantly in a low cliff, composed of shale, at Newhaven, or strewed upon the beach in that neighbourhood. They take a beautiful polish, and have been employed to make letter-weights and other ornamental articles. The name was given in consequence of the supposed origin of the fossil which is of most frequent occurrence as the nucleus of the nodules, which, however, is not a fossil beetle, but a coprolite (q. v.). Some of the nodules contain a fossil fish, and some a fossil of vegetable origin.

BEETLING is a finishing mechanical process applied originally to linen shirting, and afterwards to cotton shirting, in imitation of linen, to give the cloth a hard and wiry look, by flattening the yarn irregularly in an angled manner. This is done by the rising and falling of upright wooden stampers, placed close together in a row, with their square butts resting on a roller over which the cloth passes under them, doubled in a particular way so as to give the yarn an angled appearance when struck. The stampers are worked by the rotation of a horizontal shaft, acting with tapets, like the cylinder of a barrel-organ.

Linen weft is likewise beetled, but by hand-hammering, on a large flat stone, with a wooden mallet, to soften the yarn for easiness of working it, or 'getting it on,' in the language of the craft, in weaving. Beetling is likewise a process in flax-dressing, to separate the woody from the flexible fibres of the plant. See FLAX-DRESSING.

BEET-ROOT SUGAR. See SUGAR. The sugar obtained from the beet is similar to cane-sugar, but inferior in sweetening power. Beet-root contains on an average about 10 per cent. of saccharine matter (sugar-cane, 18 per cent.); of the varieties, the white Slesvig beet is the richest. To obtain the sugar, the roots, after being washed, are first rasped down by machines, so as to tear up the cells. The pulp is then put into bags, and the juice is squeezed out by presses. The juice is next treated with lime or sulphuric acid, to clarify it, and also filtered till no deposit is formed; after which it is boiled in large boilers to concentrate it. When it has attained a certain density (25° Beaumé), it is poured through flannel, and is now a dark-coloured sirup, which, in order to yield pure sugar, must be deprived of its colouring-matter and mucilage. This is effected by filtering it through animal charcoal or bone-black. The filtered juice is now treated with lime-water beat up with a little white of egg to a lather, till it is slightly alkaline, and is then further concentrated by boiling in copper pans, care being taken to stir and scum it all the while. When sufficiently concentrated, it is put into vessels, and allowed to stand several days in a warm room to crystallise; the uncrystallised part, or molasses, is then drained off, and what remains is raw sugar. This is still further refined by again dissolving and treating it with albumen and blood. In separating the crystallised from the uncrystallised part, centrifugal machines are now much used. Another improvement is the vacuum-pan, which allows the juice to be boiled down without burning. The molasses drained off from beet-root sugar has a disagreeable taste, and cannot be used for sweetening, like cane molasses.

About the middle of the 18th c., Margraf, an apothecary in Berlin, drew attention to the sugar contained in beet-root; but Achard, the Prussian chemist, was the first who was tolerably successful in extracting it. Still, as only 2 or 3 per cent. of sugar was obtained, the product did not pay the cost, until Napoleon's continental system raised the price of sugar, and gave rise to improved methods of manufacturing it. Even after the fall of Napoleon, protective duties kept alive this manufacture in France; and when numerous improvements of method had raised the percentage of sugar realised to about 5 lb. from 100 lb. of beet, it took a fresh start (about 1825) in France and Belgium, was revived in Germany, and spread even to Russia. The falling off of the customs' duties on the import of colonial sugar obliged the German governments to impose a small duty on beet-sugar, which checked the manufacture for a time; but owing to the protective measures of the Zollverein, it is now more flourishing than ever, and large quantities are annually imported from the continent of Europe, and are used by our refiners mixed with cane sugar, without which it is not successful, for producing the best qualities of refined or loaf-sugar. From France, Belgium, Holland, and Germany, in 1871, about 1500 tons were imported.

BEFFA'NA, a corruption of *Epiphania* (Epiphany), is the name given in Italy to a singular custom prevailing on Three Kings' Day (see BEAN-KING'S FESTIVAL), or Twelfth Night. According to tradition, the B. was an old woman who, being busy cleaning the house when the three wise men of the East passed by on their way to offer their treasures to the infant Saviour, excused herself for not going out to see them on the ground that she would have an opportunity of doing so when they returned. They, however, went home by another way; and the B., not knowing this, has ever since been watching for their return. She is supposed to take a great interest in children, who on Twelfth Night are put earlier to bed, and a stocking of each is hung before the fire. Shortly, the cry '*Ecco la B.*' is raised; and the children, who have not gone to sleep, dart out of bed, and seize their stockings, in which each finds a

present bearing some proportion in value to his conduct during the year. If any one has been conspicuously ill behaved, he finds his stocking full of ashes—the method the B. takes of expressing her disapprobation. It was also customary in Italy, on Twelfth Night, to carry an effigy called the B. in procession through the streets amid great rejoicings; but this, which was probably the relic of the celebration of a middle-age 'mystery,' has fallen greatly into disuse. The word is also used to awe naughty children.

BE'FFROI, or BELFRY, was the name of a tower used in the military sieges of ancient and medieval times. When a town was to be besieged, a movable tower, as high as the walls, was brought near it; and this tower was the beffroi. Its use is more than once spoken of by Cæsar in his account of his campaigns in Gaul. Froissart describes, with his usual spirit, a B. employed at the siege of the castle of Breteuil in 1356. At the siege of Jerusalem by the Crusaders, a B. was carried in pieces, put together just beyond bow-shot, and then pushed

Beffroi, or Breaching Tower.—From Grose's *Military Antiquities*.

on wheels to a proper position. The object of such towers was to cover the approach of troops. Sometimes they were pushed on by pressure, sometimes by capstans and ropes. The highest were on six or eight wheels, and had as many as twelve or fifteen stories or stages; but it was usual to limit the height to three or four stages. They were often covered with raw hides, to protect them from the flames of boiling grease and oil directed against them by the besieged; and there was a hinged drawbridge at the top, to let down upon the parapet of the wall, to aid in landing. The lower stage frequently had a ram (see BATTERING RAM); while the others were crowded with archers, arbalesters, and slingers; or there were bowmen on all the stages except the top, which had a storming or boarding party. During the wars under Charles I., the royalists made a B. to aid in the besieging of a town or castle in Herefordshire; it was higher than the defence-works, and was provided with loopholes, a bridge, &c.; but the Roundheads captured it before it could be applied to use. Ducange thinks that the name of belfry (q. v.) given to a bell-tower, was derived from the warlike machine called the beffroi or belfry.

BEG, or **BEY,** a Turkish title, rather vague in its import, and commonly given to superior military officers, ship-captains, and distinguished foreigners. More strictly, it applies to the governor of a small district, who bears a horse-tail as a sign of his rank. The governor of Tunis has this title.—'Beglerbeg,' or, more correctly, Beilerbegi ('lord of lords'), is the title given to the governor of a province who bears three horse-tails as his badge of honour, and has authority over several begs, agas, &c. This superior title belongs to the governors of Rumelia, Anatolia, and Syria.

BEGAS, KARL, court-painter to the king of Prussia, professor and member of the Academy of Art in Berlin, was born there in 1794. He had been destined for the law, but early manifested a love for

art, and while at Bonn, received his first lessons in painting from Philippart. In 1811, he proceeded to Paris, and there spent eighteen months in the studio of the celebrated Gros. In 1815, Frederick-William III., on the occasion of his visit to Paris, bought a large original painting by B., 'Job surrounded by his Friends,' and gave him two commissions for different churches in Berlin. This led to his moving thither in 1818, and to his subsequently residing in Italy at the king's expense. On his return to Berlin in 1825, he painted a great many biblical subjects for churches, as well as other pictures. He died 23d November 1854. There are frescoes of colossal size by him in the new church of Saerow, near Potsdam. He is especially distinguished for the animation and individuality of his portraits, and has painted for the king a gallery of celebrated authors and artists, including Humboldt, Schelling, &c. Several of his *genre* paintings have been rendered familiar by repeated engravings; and his works, in general, are eminent for expression, rich colouring, and a peculiarly clear chiaro oscuro.

BE'GGAR, a person who solicits charitable aid from the public at large. The word is supposed to have some connection with the fraternity known as Beghards. See BEGUIN. The actual begging or solicitation of temporal aid became, however, so conspicuous a feature among these mendicant orders, that the term originally applied to their sacred duties seems at a very early period to have acquired its modern vulgar acceptation. There is no class of men who have had their lot and condition so varied by ethnical and social conditions as beggars. In a civilised industrious country, the B., to have any chance of relief, must manage to get it believed, whether it be true or false, that he is on the verge of want, and requires the solicited alms to keep him from starvation. Among oriental nations, on the other hand, beggars have often been a potent class, who may be rather considered as endowed with the privilege of taxing their fellow-creatures, than as objects of compassion. It has sometimes been supposed that a residue of this feeling of superiority characterises the mental physiology even of the mendicant of civilisation, and that, abject as he seems, he considers himself to some extent a privileged person, entitled to support from his fellows, without being amenable to the slavish drudgery by which the working-classes live. In Europe, during the middle ages, those doctrines of Christianity which are intended to teach us to abjure selfishness and worldly-mindedness, were exaggerated into a profession of total abstraction from worldly cares and pursuits. Hence arose the large body of religionists who, as hermits or members of the mendicant orders, lived on the contributions of others. In later times, the mendicant orders became the proudest and the richest of the clergy; but while the chiefs lived in affluence, the practices of the lower adherents fostered throughout Europe a system of mendicancy very inimical to civilisation and industrial progress. In Great Britain its evil results have been long felt, in the inveterate establishment of practices naturally out of harmony with the independent, industrious character of the British people. Ever since the Reformation, the British laws have had a death-struggle with the B.; but neither by the kindness of a liberal poor-law, nor by the severity of a merciless criminal code, have they been able to suppress him. When a country provides, as Britain does, that no one shall be permitted to starve, it would naturally be expected that the springs of miscellaneous charity would be dried. But it is not so, and it is indeed often plausibly urged, that entirely to supersede all acts of kindly generosity between man and man, through rigid legal provisions, must lower the standard of human character, by depriving it of all opportunity for the exercise of the generous emotions. It is clear that, in the light of political economy, promiscuous charity is the most costly and most corrupting way of administering relief to indigence. No one will maintain that the idle B. on the street deserves such a luxurious table as the industrious mechanic cannot afford to himself. But, at the same time, no one who drops a coin in a beggar's hat can say how many others may be deposited there during the day, and whether the B. is merely drawing a wretched pittance, or deriving a good income. Begging being a trade, it is not always those who are the poorest, but those who are the most expert, who will practise it to the best results. The great object is to seize on and appropriate any characteristic calculated, whether permanently or temporarily, to excite compassion. Hence periods of general distress are often the harvest of the B., and his trade rises and falls in an inverse ratio with that of the working community. Times of prosperity are not favourable to him, because he is then told that there is plenty of work for him. But when workmen are dismissed in thousands, and their families turned on the road to seek alms, the professional beggars, by their superior skill and experience, will be sure to draw the prizes in the distribution. Many surprising statements have been made of the large incomes made by skilful professional beggars, especially in London. The most remarkable anecdotes on the subject will be found in Grose's *Olio*, whence they have often been repeated. Attempts have been made, but with questionable success, to set forth an average statement of the earnings in different departments of the B. trade. A good deal of information of this kind will be found in the *Report of the Constabulary Force Commission of* 1839 (see p. 60, et seq.). It does not appear, however, that this trade is, like others, dependent on the law of supply and demand. The B. generally is so constitutionally, whether from hereditary or other physical causes. He has a loathing, even to horror, of steady systematic labour, and he will rather submit to all the hardships and privations of the wanderer's lot, than endure the dreaded evil.

BEGGARS, THE LAW OF ENGLAND RELATING TO, is regulated by the 5 Geo. IV. c. 83 (amended in regard to other points by the 1 and 2 Vict. c. 38). By the third section of the 5 Geo. IV. it is enacted that every person wandering abroad, or placing him or herself in any public place, street, highway, court, or passage, to beg or gather alms, or causing or procuring, or encouraging any child or children so to do, shall be deemed *an idle and disorderly person:* and it shall be lawful for any justice of the peace to commit such offender to the house of correction, there to be kept for any time not exceeding one calendar month. And by section 4, it is further provided that any person so convicted, and offending in the same way again, shall be deemed *a rogue and a vagabond*, and may be punished by being committed to the house of correction for three months, with hard labour; and by the same section, every person wandering abroad and endeavouring, by the exposure of wounds or deformities, to obtain or gather alms, and every person going about as a gatherer or collector of alms, or endeavouring to procure charitable contributions of any nature or kind under any false or fraudulent pretence, shall be deemed a *rogue and vagabond*, and be punishable as before mentioned. By section 15, however, of the same act, the visiting justices of any county jail, house of correction, or other prison, may grant certificates to persons

discharged, to receive alms on their route to their places of settlement; but if such persons shall act in a manner contrary to the directions or provisions of their certificates, or shall loiter upon their route, or shall deviate therefrom, they shall be deemed rogues and vagabonds, and punished accordingly. Other later statutes, however, enable justices to give aid to all prisoners on being discharged from prison, and supersede this doubtful license to beg on their way home. Many prisoners' aid societies are established in different parts of the country, and if their rules are good, they receive a certificate from the visiting justices of jails. When the time arrives for the discharge of a prisoner, the justices have power, out of the moneys under their control, to order a payment of £2, either to the prisoner, or the treasurer of the aid society, for his benefit; and they may also pay his railway fare, so that by this means he can always reach his home without begging.

The attempt or purpose to obtain money or alms by means of shows or entertainments on the streets of London, is also an offence under the Metropolitan Police Act, 2 and 3 Vict. c. 47, s. 54 (No. 14), and punishable by a fine of forty shillings.

In the Scotch law, there are many severe statutes of the Scotch Parliament against beggars and vagabonds, all of which, along with the proclamations of the Scotch Privy Council on the same subject, are renewed and ratified by the act 1698, c. 21, which forms the existing Scotch law in regard to beggars. The Scotch Poor-law Amendment Act, 8 and 9 Vict. c. 83, contains no provision on the subject. Anciently, in Scotland, legal permission to beg was given to certain sick and infirm poor persons, and in the reign of James V., a system of *tokens* for the same purpose was established. See Burn's *Justice of the Peace*, vol. vi.; Charnock's *Police Guide*, Dunlop's *Parochial Law of Scotland*, Lorimer's *Hand-book of the Scotch Law*, and the works and authorities referred to in these publications.

BEGGAR-MY-NEIGHBOUR, a game at cards usually played by two persons, between whom the cards are divided. Holding their cards with the backs upwards, the players lay down a card alternately, until an honour is played, which is paid for by the adversary – four cards for an ace, three for a king, two for a queen, and one for a knave; such payment being made, the winner lifts the trick. If, however, an honour should be laid down during the payment, then the opposite party must pay for that in the same way; and so on, till a payment is made without an honour. The game is played chiefly by children.

BEGHA'RMI, or BAGI'RMI, a country in Central Africa, bounded on the N. by Lake Tsad; on the W. by the Shari, or Great River, which divides it from the kingdom of Bornou; and on the E. by the Waday kingdom. It extends southward to about lat. 10° N. Its greatest length is about 240 miles, and its breadth 150. The whole of B. Proper is flat, with a slight inclination towards the north—its general elevation being about 1000 feet above the level of the sea. The outlying provinces in the south-east are slightly mountainous. B. has three considerable rivers flowing through and along its borders the Bénuwé, Logon, and Shari; the last of which, augmented by the Logon, is upwards of 600 yards across at Mole. There is, in general, however, the utmost scarcity of water in the country, and the inhabitants guard their wells with jealous care. The soil is partly composed of sand, and partly of lime, and produces the grain and fruit common to countries of Central Africa. Worms and ants are very destructive to the crops. The ants appear to be a perfect pest. Dr Barth describes them as eating through his matting and carpeting, and he had the utmost difficulty in preserving his goods from entire destruction by them. The total population is about a million and a half. From the numerous deserted villages with which the traveller constantly meets, the population would appear to have been much greater at one time. Mohammedanism has been introduced among them, but many are still pagans, and all are grossly superstitious. The only industrial arts are weaving and dyeing. Physically, they are a fine race of people, superior to the tribes around them, the women being especially handsome. The men are subject to a peculiar disease in the little toe, called 'mukárdam.' It seems to be caused by a worm, which eats the toe away. One in ten of the male population are said to have lost their little toes through this cause. The sultan is absolute in his own dominions, and several smaller states are tributary to him; and he, in his turn, is tributary to the more powerful ruler of Bornou. The fighting-force of the kingdom is about 13,000 men. Masena (q. v.), the capital, has a circumference of about 7 miles.—Barth's *Travels in Central Africa*.

BE'GKOS, or BEI'KOS, a large village of Anatolia, on the Bosphorus, 8 miles north-north-east of Scutari, said to be the locality of the contest between Pollux and Amycus, in which the latter was killed. See ARGONAUTS. At the commencement of the Crimean war, the Allied fleets anchored in B. Bay, prior to their entering the Black Sea in January 1854.

BE'GLERBEG. See BEG.

BEGONIA'CEÆ, a natural order of exogenous plants, the place of which in the system is doubtful, but is supposed by Lindley to be near *Cucurbitaceæ* (q. v.). The B. are herbaceous or suffruticose plants, with alternate leaves, which are oblique at the base, and have large dry stipules. The flowers are in cymes, unisexual, the perianth coloured, with four unequal divisions in the male flowers, and five or eight in the female; the stamens are numerous; the fruit is membranous, winged, 3-celled, bursting by slits at the base, the seeds minute.—The order contains about 160 known species, all of which have pink flowers. They are almost all tropical plants, and some of them are often to be seen in British hot-houses; but a small species of *Begonia* ascends the Himalaya to at least 11,500 feet, often growing on the trunks of trees. The leaves of the *Begonias* have a reddish tinge. The leaves and young stems are succulent and acid, and those of *B. Malabarica*, *B. tuberosa*, and other species, are used as pot-herbs, or in tarts. The juicy stalks of a large species found in Sikkim, at an elevation of five or six thousand feet, are mentioned by Dr Hooker as employed to make a pleasant acid sauce. This, and the small Himalayan species already mentioned, would probably succeed in the climate of Britain. The roots of some are used in their native countries as astringents, and some of the Mexican species are used as drastic purgatives.

BEG-SHE'HR, a fresh-water lake of Asia Minor, Karamania, 44 miles south-west of Koniyeh, presumed to be the ancient *Caralitis*. It is about 20 miles long, and from 5 to 10 miles broad. It contains many islands, and discharges itself by a river of the same name into Lake Soglah. On its east and north shores are the towns of Begshehr and Kereli, the old *Caralio*, which issued imperial coins, and which is also supposed to have occupied the site of Pamphylia.

BEGTA'SHI, a religious order in the Ottoman empire, which had its origin in the 14th c. The name is believed to be derived from that of a

celebrated dervise, Hadji Begtash, to whom also the order appears to owe its institution. The members use secret signs and pass-words as means of recognition, in the same way as is done by the masonic orders, some of them indeed appearing to be identical with those of freemasonry. Although numbering many thousands of influential persons in its ranks, the society does not appear to exercise any material influence in the religion or politics of Turkey.

BE'GUINES, BEGUI'NÆ, or BEGU'TTÆ, the name of the earliest of all lay societies of women united for pious purposes. The reason of their origin is not quite certain, but it is usually attributed—in part, at least—to the disproportion in the numbers of men and women which was occasioned by the Crusades. These wars had robbed Christendom of thousands of its most vigorous sons, and left multitudes of widows and maidens, to whom life had henceforth something of a solemn and sorrowful aspect, and who therefore betook themselves, in earnest and affectionate piety, to the charities and duties of religion. The origin of the word is doubtful. The popular tradition of Brabant since the 17th c., that a St Begga, daughter of Pepin, and sister of St Gertrude, founded, in 696, the first sisterhood of B. at Namur, has no historical basis. Hallmann has also shewn that the supposed oldest document of the B. (1065), giving an account of their establishment at Vilvorde, near Brussels, is unauthentic. The most probable account is, that a priest named Lambert le Bègue, or Le Bèghe, i. e., the Stammerer, about the year 1180, founded, in Liege, a society of pious women, who were called by his name. The B. were not restricted by vows, nor did they follow the rules of any order, but were united under a *supérieure* for the exercise of piety and benevolence, and lived generally in separate small cottages, which, collectively, formed the *Beginagium*, or '*vineyard*,' as it was scripturally termed. Their establishments were often enriched by liberal donations. A church, a hospital, and a house of reception or common entertainment, generally belonged to every community of Beguines. The sisters were distinguished from the rest of the laity only by their diligence and devotedness, piety, modesty, and zeal for the purity of youthful education. Societies of B. flourished greatly during the 12th and 13th centuries, when they spread themselves over France and Germany. Among the most important were those in Hamburg, Lübeck, Regensburg, Magdeburg, Leipsic, Goslar, Rochlitz, and Görlitz. As the pietists of the middle ages, the B. were often subjected to persecution by the mendicant orders of friars; but, on account of their practical usefulness, were sheltered by the pope and councils as well as by secular authorities. In the 13th and 14th centuries, the B. became united with the persecuted spiritualists among the Franciscans (*Fratricelles*), and with the sect of the 'Brethren and Sisters of the Free Spirit.' Hence arose certain heresies, which, of course, occasioned interference on the part of the Inquisition; and on account of certain immoralities, a synod held at Fritzlar required that all candidates must be forty years old before they could enter a society of Beguines. These sisterhoods maintained their position in Germany and the Netherlands longer than in other countries. In Holland, they existed at the close of the 18th c.; and in the present day we find here and there so-called *Beguinen-häuser* (Beguin-houses) in Germany; but they are now nothing more than almshouses for poor spinsters. At Ghent, there is still a celebrated institution of B., numbering as many as 600 sisters, besides 200 *bezitsters*, or occasional inmates. Their houses form a kind of distinct little town, called the Béguinage, which, though environed by a wall, is open to the visits of strangers. Living here a life of retirement and piety, the B., in their simple dark dresses, go out as nurses to the hospital, and perform other acts of kindness among the poor. As above stated, they are under no monastic vow, but having attached themselves to the sisterhood, it is their boast that none is known to have quitted it. There are houses of B. also at Antwerp, Mechlin, and Bruges; and in 1854, one was established in France, at Castelnaudry, in the department of Aude.

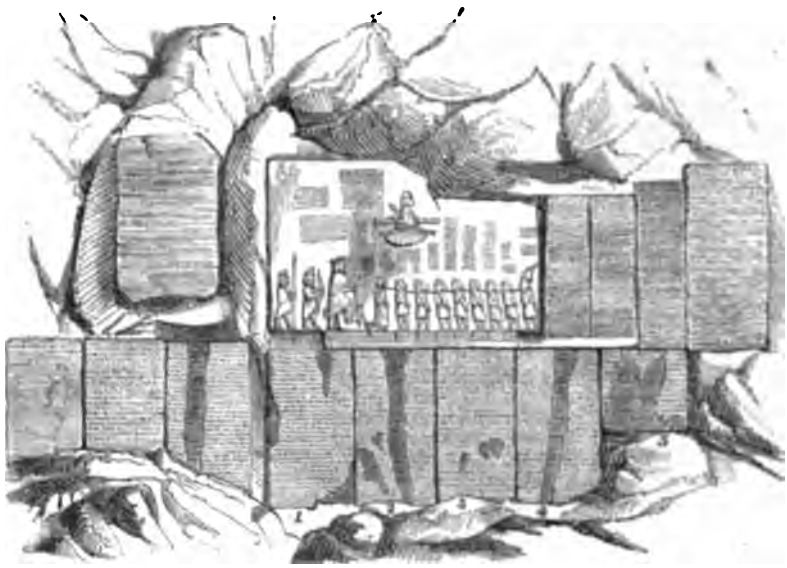
BEGHARDS (Ger. *begehren*, to seek with importunity). Societies of laymen styling themselves *B.*, first appeared in Germany, the Netherlands, and the south of France in the beginning of the 13th c., and were known in Italy as *Bianchi* and *Bocasoti*; but they never obtained the reputation enjoyed by the Beguine sisterhood. Towards the end of the 13th c., they were commonly stigmatised as *bons garçons*, *boni pueri*, 'ministers' men,' 'bedesmen,' 'pietists,' 'vagabonds'—contemptuous titles, which expressed the low estimation in which they were held. On account of heretics of all sorts retreating into these half-spiritual communities, they were subjected to severe persecutions after 1307, and were gradually dispersed, or joined the orders of Dominicans and Franciscans. In the Netherlands, where they had preserved a better character than elsewhere, they maintained their ground longer, and were protected by Pope Innocent IV. (1245), in Brussels by Cardinal Hugo (1254), and in Liege by Pope Urban IV. (1261); but their communities disappeared in the 14th c. —See Mosheim, *De Beghardis et Beguinabus* (Lesp. 1790), and Hallmann's *Geschichte des Ursprungs der Belg. Beghinen* (History of the Origin of Beguines in Belgium), Berlin, 1843.

BEHAIM, MARTIN, a famous cosmographer, descended from a Bohemian family which settled in Nuremberg after the middle of the 13th c., and still flourishes there. B. was born in Nuremberg in 1430 (or, more probably, in 1436). He early entered into mercantile life, and went to Venice (1457), and to Mechlin, Antwerp, and Vienna (1477—1479), in pursuit of trade. In 1480, he was induced to go to Portugal, where he soon acquired a reputation as a skilful maker of maps. From 1484 to 1485, he accompanied the Portuguese navigator, Diego Cam, in a voyage of discovery along the west coast of Africa, and sailed as far as the mouth of the Zaire or Congo river, in lat. 22° S., which was 19½° further than had ever been previously reached. In 1486, B. sailed to Fayal, one of the Azore islands, where a Flemish colony had settled. Here he married the daughter of Jobst von Küster, governor of the colony. In 1490, he left Fayal, and returned to his native city, Nuremberg, where he resided from 1491 to 1493. During this stay, he constructed a large globe, principally from the writings of Ptolemy, Pliny, Strabo, Marco Polo, and Sir John Mandeville. It is still preserved by the family of B. in Nuremberg, and is a valuable record of the progress of discovery, though it indicates that B.'s geographical knowledge did not at that period extend beyond Japan on the east, and the Cape Verd Islands on the west. After travelling through Flanders and France, B. again resided in Fayal from 1494 to 1506, and then removed to Lisbon, where he died, July 29, 1509. The services rendered by B. to geographical discovery and the science of navigation were considerable, though, according to the latest investigations, there is no support for the theory that B. was the discoverer of America, or even that Columbus and Magelhaen were indebted to B. for guidance with regard to their discoveries. B. left

no works behind him except his maps and charts.—Murr's *Diplomatische Geschichte des Ritters von B.* (Nürn. 1778; 2d Aufl., 1801); and A. von Humboldt's *Examen Critique de l'Histoire de la Géographie du Nouveau Continent*, vol. i. (Par. 1836).

BEHEA'DING. See CAPITAL PUNISHMENT.

BEHISTU'N, or **BISUTU'N** (Lat. *Bagistanus*; Persian, *Baghistan*, Place of Gardens), a ruined town of the Persian province of Irak-Ajemi, 21 miles east of Kirmanshah, lat. 34° 18′ N., long. 47° 30′ E. B. is chiefly celebrated for a remarkable mountain, which on one side rises almost perpendicularly to the height of 1700 feet, and which was in ancient times sacred to Jupiter or to Ormuzd. According to Diodorus, Semiramis, on her march from Babylon to Ecbatana, in Media Magna, encamped near this rock, and having cut away and polished the lower part of it, had her own likeness and those of a hundred of her guards engraved on it. She further, according to the same historian, caused the following inscription in Assyrian letters to be cut in the rock: 'Semiramis having piled up one upon the other the trapping of the beasts of burden which accompanied her, ascended by these means from the plain to the top of the rock.' No trace of these inscriptions is now to be found, and Sir Henry Rawlinson accounts for their absence by the supposition that they were destroyed 'by Khusraú Parvíz when he was preparing to form of this long scarped surface the back wall of his palace.' Diodorus also mentions that Alexander the Great, on his way to Ecbatana from Susa, visited Behistun. But the rock is especially interesting for its cuneiform inscriptions (q. v.), which within recent years have been successfully deciphered by Sir H. Rawlinson. The principal inscription of B., executed by the command of Darius, is on the north extremity of the rock, at an elevation of 300 feet from the ground, where it could not have been engraved without the aid of scaffolding, and can now only be reached by the adventurous antiquary at considerable risk to his life. The labour of polishing the face of the rock, so as to fit it to receive the inscriptions, must have been very great. In places where the stone was defective, pieces were fitted in and fastened with molten lead with such extreme nicety, that only a careful scrutiny can detect the artifice. 'But the real wonder of the work,' says Sir H. Rawlinson, 'consists in the inscriptions. For extent, for beauty of execution, for uniformity and correctness, they are perhaps unequalled in the world. After



Rock Inscriptions at Behistun.

the engraving of the rock had been accomplished, a coating of silicious varnish had been laid on, to give a clearness of outline to each individual letter, and to protect the surface against the action of the elements. This varnish is of infinitely greater hardness than the limestone rock beneath it.' Washed down in some places by the rain of twenty-three centuries, it lies in consistent flakes like thin layers of lava on the foot-ledge; in others, where time has honey-combed the rock beneath, it adheres to the broken surface, still shewing with sufficient distinctness the forms of the characters. The inscriptions—which are in the three forms of cuneiform writing, Persian, Babylonian, and Median—set forth the hereditary right of Darius to the throne of Persia, tracing his genealogy, through eight generations, up to Achæmenes; they then enumerate the provinces of his empire, and recount his triumphs over the various rebels who rose against him during the first four years of his reign. The monarch himself is represented on the tablet with a bow in hand, and his foot upon the prostrate figure of a man, while nine rebels, chained together by the neck, stand humbly before him; behind him are two of his own warriors, and above him, another figure [see cut]. The Persian inscriptions which Sir H. Rawlinson has translated are contained in the five main columns numbered in cut 1, 2, 3, 4, 5. The first column contains 19 paragraphs, and 96 lines. Each paragraph after the first, which commences, 'I am Darius the Great King,' begins with, 'Says Darius the King.' The second column has the same number of lines in 16 paragraphs; the third, 92 lines and 14 paragraphs; the fourth has also 92 lines and 18 paragraphs; and the fifth, which appears to be a supplementary column, 35 lines. With the exception

of the first paragraph on the first column, all begin with, 'Says Darius the King.' The second, fourth, and fifth columns are much injured. Sir H. Rawlinson fixes the epoch of the sculpture at 516—515 B.C. See *Journal of Asiatic Society*, vol. x.

BEHME, JACOB. See BÖHME.

BEHN, APHARA, or APHRA, a licentious poetess and novelist of the reign of Charles II., the date of whose birth is unknown, was the daughter of Mr Johnson, a gentleman who, through his aristocratic connections, obtained the appointment of governor of Surinam. He died on his passage out, but the daughter pursued her journey, and resided at Surinam for some considerable time. Here she made the acquaintance of the celebrated slave Oronoko, who afterwards became the subject of one of her novels, and of a tragedy by Southern. Returning to England, she married Mr Behn, a merchant of Dutch extraction, was presented at court, where her personal appearance and vivacious freedom of manners pleased the 'Merry Monarch,' who deputed her to watch events in Flanders. She accordingly went to Antwerp, where she succeeded in discovering the intention of the Dutch to sail up the Thames and Medway, and communicated the secret to the English court; which, however, took no notice of the information, a slight which caused the fair agent to throw up state politics in disgust. On her return to England, she became intimate with all the profligate wits as well as the more staid scholars and poets of the time, and devoted herself to literature. Her numerous plays, poems, tales, letters, &c., are disfigured alike by general impurity of tone and indecency of language; and, in point of intellectual ability, none of her works appear deserving of the high praise lavished on them by Dryden, Cotton, Southern, and others. She died in 1689.

BE'HRING, VITUS, the discoverer of the strait called after his name, was a native of Denmark, and entered as captain the newly formed navy of Peter the Great. From the ability and daring he had displayed in the wars with Sweden, he was appointed to conduct an expedition of discovery in the Sea of Kamtchatka. Sailing, in 1728, from a port on the east of Kamtchatka, he followed the coast northward until he believed, from the westward trending of the land, that he had reached the north-east point of Asia. It is now, however, believed that the cape which B. rounded was to the south of the real East Cape (in lat. 66°), and that he never actually reached the strait to which he has given his name. After some years spent in explorations on the coasts of Kamtchatka, Okhotsk, and the north of Siberia, he sailed in 1741 from Okhotsk towards the American continent, and sighting land about 58½° N. lat., he followed the coast northward for some distance; but sickness and storms obliged him to return, and being wrecked on the desert island of Awatska, since called Behring's Island, he died there, 8th December 1741. The previous year, he had founded the present settlement of Petropaulovski, in the Bay of Awatska.

BE'HRING'S STRAIT separates Asia from America, and connects the Pacific with the Arctic Ocean. The proof that the two continents were not connected was given by the voyage of a Cossack named Deschnew, who, in 1648, sailed from a harbour in Siberia, in the Polar Ocean, into the Sea of Kamtchatka. But the whole voyage was long regarded by Europeans as a fable, until Behring's (q. v.) expedition in 1728. The strait has since been explored by Cook and Beechy. The narrowest part is near 66° lat., between East Cape in Asia, and Cape Prince of Wales in America. The distance between the two capes, in a direction from north-west to south-east, is nearly 50 miles; about midway are three uninhabited islands. The greatest depth, some 30 fathoms, is towards the middle, and the water is shallower towards the American coast than the Asiatic. A very old Japanese map in the British Museum shows the leading features of this strait very accurately. —BEHRING'S SEA, a part of the North Pacific Ocean, commonly known as the Sea of Kamtchatka, bounded west by Kamtchatka, east by Alaska, south by the Aleutian Islands, and north by Behring's Strait. There are several islands in this sea, and fogs prevail constantly; but owing to the shallowness of the strait, there are no icebergs of magnitude to be met with.—BEHRING'S ISLAND, the most westerly of the Aleutian Islands in lat. 55° 22′ N., long. 166° E. It has an area of 30 square miles, and is noteworthy as the place where Behring, the discoverer, was wrecked and died in 1741.

BEILA'N, a pass and town in the northern extremity of Syria, on the east shore of the Gulf of Iscanderoon. The pass of B. runs from south-west to north-east, between the mountain-ranges of Rhosus and Amanus, and is the common route from Cilicia into Syria. It is one of the two Amanum passes, supposed to be the lower one, mentioned by Cicero as capable of easy defence on account of their narrowness. There seems to be no doubt that, in the war between Darius and Alexander, the B. Pass was an important consideration to both commanders, but historians and geographers appear to be at variance as to the precise advantage taken of it in the struggle. The town of B. is situated near the summit-level of the pass, at an elevation of 1584 feet above the Mediterranean Sea. It has a population of about 5000, many of whom are wealthy, and is much esteemed for its salubrity and fine water, which is supplied by numerous aqueducts. Between the north-western foot of the pass and the sea, are caves and springs, supposed to be the site of the ancient Myriandrus. B. was the scene of a battle between the Egyptians and Turks in 1832, when the latter were defeated.

BE'IRA, a Portuguese province, bounded N. by the provinces of Minho and Tras-os-Montes; S. by Estremadura and Alemtejo; E. by Spain; and W. by the Atlantic Ocean. It has an area of about 8576 square miles, and a pop. (1871) of 1,294,292. The surface is mountainous, and the soil on the plains sandy, and generally far from fertile. The mountain-slopes afford good pasturage for sheep and cattle. The products are corn, wine, oil, flax, and various kinds of fruit, and considerable attention is paid to the rearing of bees. Sea-salt is obtained at the coast. The river Douro waters the whole of its northern, and the Tagus, a portion of its southern, boundary. The Mondego and Vouga flow through its centre. Iron, coal, and marble are wrought in small quantity. There is little done in manufactures. The inhabitants are an industrious race of people. In 1835, the province was divided into Upper and Lower Beira, the former having Viseu and the latter Castel Branco for its capital.

BEIRAM, or BAIRAM, a Mohammedan fe[illegible] somewhat analogous to Easter. It commen[illegible] diately after the fast of Ramadan, or which corresponds to Lent. Bei[illegible] one o[illegible] two feasts the Moslems have in [illegible], it forward to with great intens[illegible] enhanced by the previous absti[illegible] is announced at Constantinople b[illegible] artillery, the beating of drums, [illegible] trumpets. Properly, it should terminate

but the Moslems in the capital think it no offence to their abstemious prophet to carry the festivities over two days; while in other parts of Turkey and Persia, they are often protracted a week or more. Dances, music, processions, &c., in which the women are permitted greater indulgence than usual, form prominent features of the feast; and at this time the different orders of the empire pay homage to the sultan. Seventy days after, the Moslems celebrate their only other feast ('the festival of the sacrifices'), called the *lesser* B., which is the day appointed by the Mecca pilgrims for slaying the victims, and was instituted in commemoration of the offering up of Isaac by Abraham. The lesser B. usually lasts three days, but it is not celebrated with anything like the pomp of the other. During the continuance of each of the festivals, only one religious service takes place. The Mohammedan year being the lunar one of 354 days, in the course of thirty-three years the festivals run through all the seasons.

BEIT is an Arabic word, signifying house, abode, or place, the equivalent of which in Hebrew is *Beth*. Thus, in the former language, we have *Beit-al-Haram*, 'the house of the sanctuary,' or 'the sacred house;' and in the latter, *Beth-el*, 'house of God;' *Beth-any*, 'place of dates;' *Beth-abara*, 'place of fords,' &c.

BEIT-EL-FAKIH (House of the Saint), a town of Tehama, on the Red Sea. Being the frontier town of the Egyptian government, it has a considerable trade in coffee, wax, gum, &c., which articles are exchanged for Indian piece goods and British shawls. It has a population of about 8000, and a citadel of some strength. The houses are built partly of mud and partly of brick, and roofed with branches of the date-tree. It is described by travellers as the hottest town in Tehama.

BEITU'LLAH (Arab., House of God), the spacious building or temple at Mecca, which contains the Kaaba. See MECCA and KAABA.

BEJA (the *Pax Julia* of the ancients), a town in the province of Alemtejo, Portugal, 36 miles south-south-west of Evora, with a population of 5500. It is fortified, its walls being flanked by 40 towers, has a castle and a cathedral, and manufactories of leather and earthenwares.

BEJAN, or BAJAN, the name of the first or 'freshman' class in some at least of the Scotch, and of old in many continental universities. The word is believed to be derived from the French *bec-jaune*, or yellow neb, a term used to designate a nestling or unfledged bird. The levying of *bejaunia*, or payments for 'first-footing' by students on entering college, was forbidden by the statutes of the university of Orleans in 1365, and of the university of Toulouse in 1401. The election of an *Abbas Bejaunorum*, or 'Abbot of the Greenhorns,' was prohibited by the statutes of the university of Paris in 1493. In the university of Vienna, the *bejan* was called *beanus*, a word of the same meaning, and no doubt of the same origin.

BEJAPU'R, a deserted city in the presidency of Bombay, lat. 16° 50' N., and long. 75° 48' E. It is situated to the south-east of Bombay, Poonah, and Satara, at the respective distances of 245, 170, and 130 miles, being on an affluent of the Kistna or Krishna, which flows into the Bay of Bengal, and nearly touching the west border of the Nizam's territories. B. was for centuries the flourishing capital of a powerful kingdom, falling therewith under various dynasties in succession, Hindu and Musulman, till, in 1686, it was captured by Aurungzebe. Thus stripped of its independence, B. speedily sank into the shadow of a mighty name, passing, during the early part of the 18th c., into the hands of the Mahrattas. On the overthrow of the Peishwa in 1818, it was assigned by the British to the dependent Rajah of Satara; being resumed, however, by the donors on the extinction of the reigning family in 1848. Now that a gradual decay has done its worst, B., as its own mausoleum, presents a contrast perhaps unequalled in the world. Lofty walls of hewn stone, still entire, with an imposing background of cupolas and minarets, enclose the silent and desolate fragments of a city which is said to have contained 100,000 dwellings, and to have been divided into quarters that measured their circuit by leagues. With the exception of an ancient temple, the sole relic of aboriginal domination, the ruins are of Mohammedan origin, such as beautiful mosques, colossal tombs, and a fort of more than 6 miles in circuit, with an inner citadel. In addition to the architectural remains, one of the wonders of the place is, perhaps, the largest piece of brass ordnance in existence, cast at Ahmednuggur, where the mould may still be seen. Latterly, all these monuments of the instability of human grandeur have been carefully preserved, both the Rajah of Satara and the British government having done everything to prevent further decay and dilapidation. Pop. (1872) 13,245.

BEKAA, the Cœle-Syria of the ancients, the 'Plain of Lebanon' of the Old Testament, and El Bekaa (the Valley) of the natives of Syria, is enclosed between the parallel ranges of Lebanon and Anti-Lebanon, which mountains it divides, and extends about 90 miles from north to south, its greatest width being about 12 miles. It is the most rich and beautiful plain in Syria; but although the soil is good, and water abundant from the numerous mountain-springs, a very small portion of it is cultivated. It is very much frequented by the Arabs who bring down their young horses in the spring-time to graze on the plain.

BEKE, CHARLES THEOPHILUS, Ph.D., &c., a modern English traveller, was born in London, October 10, 1800; received a commercial education; afterwards studied law in Lincoln's Inn, and devoted a great part of his attention to ancient history, philology, and ethnography. The results of these studies first appeared in his work, *Origines Biblicæ*, or researches in primeval history, vol. i. (Lond. 1834). His historical and geographical studies of the East led B. to consider the great importance of Abyssinia for intercourse with Central Africa; but his proposals to undertake an exploring journey were declined by the government and by several learned societies. Supported only by private individuals, he joined in Abyssinia the party led by Major Harris, and distinguished himself by the exploration of Godshem and the countries lying to the south, previously almost unknown to Europe. The results of these researches appeared partly in several journals, and in *Abyssinia, a Statement of Facts*, &c. (2d ed., Lond. 1846). Having returned to Europe, he excited the attention of geographers by his publications: the *Essay on the Nile and its Tributaries* (Lond. 1847); *On the Sources of the Nile* (1849); and by his *Mémoire Justificatif en Réhabilitation des Pères Paez et Lobo* (Paris 1848). In 1861, Dr and Mrs B. made a journey to Harran; and undertook in 1865 a fruitless mission to Abyssinia, to obtain the release of the captives. At the commencement of 1874, Dr B. started for the region at the head of the Red Sea, where he claimed (though his views are disputed) to have discovered Mount Sinai, east of the Gulf of Akabah, and not west as generally supposed. He died in July of the same year, being engaged at the time on an account of his journey to Sinai. He had enjoyed a civil list pension since 1870.

BEKES, or BEKESVAR, a town of Hungary, capital of the county of the same name, and situated at the confluence of the Black and White Körös. Pop. 22,550, who do a trade in cattle, corn, and honey.

BEKKER, IMMANUEL, a German philologist, distinguished by his recensions of the texts of Greek and Roman classics, was born in Berlin, 1785; studied in Halle, 1803—1807, and was the most eminent pupil of F. A. Wolf. Afterwards, he was engaged at Paris on the *Corpus Inscriptionum Græcarum*. The results of his researches in the libraries of Italy (1817—1819) appear in his *Anecdota Græca* (3 vols., Berlin, 1814—1821), and his numerous recensions of texts derived solely from MSS., and independently of printed editions. The writers included in these recensions are Plato, the Attic orators, Aristotle, Sextus Empiricus, Thucydides, Theognis, Aristophanes, &c. He became professor at Berlin in 1810, and died in 1871.

BEL AND THE DRAGON, an apocryphal book of the Old Testament. It does not seem to have been accepted as inspired by the Jewish Church, nor is there any proof that a Hebrew or Chaldee version of the story ever existed. Jerome considered it a 'fable,' an opinion in which most modern readers will coincide. It is, nevertheless, read for edification both in the Roman Catholic and Anglo-Catholic churches: in the former, on Ash Wednesday; in the latter, on the 23d of November. According to Jahn, the aim of the writer was 'to warn against the sin of idolatry some of his brethren who had embraced Egyptian superstitions.'

BELA, the name of four Hungarian kings of the family of Arpad.—B. I. (1061—1063) energetically suppressed the last attempt to restore heathenism, and by the introduction of a fixed standard of measures, weights, and coinage, virtually founded the commerce of Hungary. He was also the first to introduce the representative system into the diet, by appointing, in lieu of the collective nobility, two nobles only from each of the different counties.—B. II., surnamed 'the Blind,' 1131—1141, was entirely under the guidance of his bloodthirsty spouse, Helena, and after her decease, drank himself to death.—B. III., 1174—1196. Educated in Constantinople, he introduced Byzantine customs and culture into his own country, which was certainly favourable to its social development, though, on the other hand, his evident devotion to the Greek emperor Emmanuel threatened its political independence.—B. IV., 1235—1270, son of that Andreas from whom the nobles extorted the 'Golden Bull,' Hungary's Magna Charta. His chief aim was to humble the nobility, and restore the royal power to its former proportions; and he thus roused a spirit of universal discontent, which led to a party among the nobles calling in the Austrian duke, Frederick II., to their aid; but, in the year 1236, he was conquered by B., and forced to pay tribute. Before long, however, the king had to seek a refuge with his discomfited foe; for the Mongols, who invaded Hungary in 1241, defeated him on the Sajo, and put him to flight. It was only after robbing him of all the treasure he had managed to save, and extorting from him three of his counties, that Frederick II. granted the royal fugitive a shelter in Austria, where he remained till the Mongols, having heard of the death of their khan, left the country they had devastated. B. now made it his especial care, by rebuilding the destroyed villages, and inviting new settlers thither, to do away with the tokens of that terrible invasion; and he so far succeeded as to be able, in 1246, to repay Frederick's inhospitality by defeating him at Vienna, and to repulse a second attempt at Mongolian invasion. He died in 1270, his last years having been embittered by an attempt at rebellion on the part of his son Stephen.

BELAYING, one of the many modes of fastening ropes on shipboard. It is effected by winding a rope, generally a part of the running rigging, round a piece of wood called a cleat or a kevel, or else round a belaying-pin, which is an ashen staff from twelve to sixteen inches in length.

BELBEY'S (ancient *Bubastis Agria*), a town of 5000 inhabitants, situated on the east arm of the Nile, Lower Egypt, and 28 miles north-north-east of Cairo. It is enclosed by earthen ramparts, has numerous mosques, and is one of the stations on the route from Cairo to Suez, and from Egypt to Syria.

BELCHER, SIR EDWARD, a distinguished English naval officer, born in 1799, entered the navy in 1812 as a first-class volunteer, was soon made a midshipman, and in 1816 took part in the bombardment of Algiers. In 1825, B. was appointed assistant-surveyor to the expedition about to explore Behring's Strait under Captain Beechey; in 1829, he was raised to the rank of commander. 1836 saw him in command of the *Sulphur*, commissioned to explore the western coasts of America and the Indies. He was absent six years, in which time he had sailed round the world. During this voyage he rendered important services in the Canton river to Lord Gough, whose successes over the Chinese were greatly due to B.'s soundings and reconnaissances pushed into the interior. On his return, he published a narrative of the voyage; and in 1843, in consideration of his services, he was made a post-captain, and knighted. After being employed on surveying service in the East Indies, he was, in 1852, appointed to the command of the expedition sent out by government to search for Sir John Franklin. B. has published *The Last of the Arctic Voyages* (Lond. 1855); *Narrative of a Voyage to the East Indies in* 1843—1845; and *Horace Edward Brenton*, a novel (1856). In 1861 he became rear-admiral, in 1866 vice-admiral, and in 1867 K.C.B. He retired in 1866.

BELCHI'TÉ, a town of Spain, in the province of Saragossa, about 22 miles south-south-east of the city of that name, celebrated as the place where, in June 18, 1809, the French, under Suchet, completely routed the Spanish under General Blake, capturing all their guns, 10 in number, with a loss of only 40 men.

BELE'M, a town of Portugal, on the right bank of the Tagus, 2 miles south-west of Lisbon, of which it may be said to form a fashionable suburb. It has an iron foundry, a custom-house, and quarantine establishment, a tower defending the entrance of the river. It is historically interesting as the place from whence Vasco da Gama set sail on his voyage of oriental discovery. It was taken in November 1807 by the French, the royal family of Portugal embarking from its quay for Brazil as they entered. In 1833 it was occupied by Dom Pedro's troops.

BELE'M, or PARA', a city of Brazil, on the right bank of the Para, the most southerly arm of the estuary of the Amazon. See PARA.

BE'LEMNITES (Gr. *belemnon*, a dart or arrow), an interesting genus of fossil cephalopodous *Mollusca*, the type of a family called *Belemnitidæ*, to the whole of which the name B. is very generally extended, closely allied to the *Sepiadæ*, or Cuttle (q. v.) family. No recent species of B. is known: fossil species are very numerous, and are found in all the oolitic and cretaceous strata, from the lowest lias to the upper chalk, some of which are filled with myriads of their

remains. These remains are generally those of the shell alone, which is now known to have been an internal shell, entirely included within the body of the animal, like that of the cuttle. The shell, as

Belemnites pistiliformis.

seen in the most perfect specimens, is double, consisting of a conical chambered portion (the *phragmocone*), inserted into a longer, solid, somewhat conical or tapering, and pointed sheath. The space between the phragmocone and sheath is occupied either with radiating fibres or conical layers. The chambers of the shell are connected by a tube (*siphuncle*), so that the animal probably had the power of ascending and descending rapidly in the water. Its arms are known, from some singularly perfect specimens, to have been furnished with horny hooks; and these it probably fixed upon a fish, and descended with its prey to the bottom, like the hooked calamaries (q. v.) of the present seas. Remains of an ink-bag, like that of the cuttle, have been found in the last and largest chambers of the B.; but remains of this chamber, which must have contained all the viscera of the animal, are very rarely preserved, the shell having been very thin at this part. The part most commonly found, and generally known by the name of belemnite, is the solid *mucro*, or point into which the sheath was prolonged behind the chambered shell. These have received such popular names as Arrowheads, Petrified Fingers, Spectre-candles, Picks, Thunder-stones, &c., from their form, or from the notions entertained of their nature and origin. B. appear to have been of very different sizes; in some of the largest, the mere *mucro* is 10 inches long, and the entire animal, with its arms outstretched, must have been several feet in length.

BELFA'ST, the chief town of the county of Antrim and province of Ulster in Ireland. This great seaport stands at the embouchure of the Lagan, at the head of Belfast Lough, 12 miles from the Irish Sea, 101 north of Dublin, 36 north-east of Armagh, 130 south-west of Glasgow, and 150 north-west of Liverpool. The site is chiefly on an alluvial deposit not more than 6 feet above the sea-level, and reclaimed from the marshes of the Lagan. On the land-side, it is picturesquely bounded by the ridges of Divis (1567 feet high), and Cave Hill (1185 feet). The general aspect of B. is indicative of life and prosperity, exhibiting all the trade and manufacture of Glasgow and Manchester, with far less of their smoke and dirt. Many of the streets, especially in the White Linen Hall quarter, are well built and spacious. The mercantile quarter lies chiefly near the extensive and well-built quays. The manufactories are mostly on the rising-ground on the north and west of the town. Numerous villas sprinkle the northern shores of the bay, as well as the elevated suburb of Malone to the south. The chief public buildings are Queen's College, a beautiful structure in the Tudor style, opened in 1849, with a revenue of £7000 from the consolidated fund; Royal Academical Institution, incorporated in 1810, affiliated to the London University, and comprising an elementary and collegiate department, and a school of design; Museum, Linen Hall, Commercial and Corn Exchanges, churches, and banks. The fine Botanic Gardens of the Natural History Society occupy 17 acres. B. is the chief seat of the trade and manufactures of Ireland, and is second only to Dublin as an Irish port. The staple manufactures are linen and cotton. The linen manufacture dates from 1637. Cotton-spinning by machinery dates from 1777, and linen from 1806. The other chief branches of industry are linen and cotton weaving, bleaching, dyeing, calico-printing, and iron founding. There are many flour and oil mills, chemical works, breweries, alabaster and barilla mills, saw-mills, ship-building, rope, and sail-cloth yards. The iron ship-building yard on Queen's Island employs upwards of 2000 hands. The inland trade is carried on by the Lagan, by the Ulster Canal, and by three railways. The harbour is undergoing very extensive improvements, which, when completed, will make B. one of the first-class ports of the United Kingdom. Before the recent improvements there were only 2 tidal docks; between 1866 and 1872, 5 new docks and a tidal basin, with about 25 acres of water area, have been opened. On these a sum of £279,968 has been expended, making the total assets of the commissioners charged with the improvements amount to £823,655. The imports of B. were, in 1866, valued at £12,417,000; the exports about £11,915,000. In 1872, 7999 vessels, of an aggregate tonnage of 1,266,364 tons, entered the port; and 3373, of 748,809 tons, cleared. The most important branch of commerce is the Channel trade. Pop. (1821) 37,000; (1851) 103,000; (1871) 174,394. B. is governed by a corporation of 10 aldermen—one being mayor—and 30 councillors. It returns 2 members to parliament. B. was destroyed by Edward Bruce in the 14th c., but became an important town since 1604, receiving a charter in 1611. In the great civil war, the inhabitants at first joined the parliament, but afterwards became royalists.

BELFORT, or BEFORT, a town of France, till 1870 in the department of Haut-Rhin. It now gives its name to a small territory (234 sq. m.) (*Territoire de Belfort*), consisting of those portions of Haut-Rhin which, seized by Germans during the war of 1870—1871, were restored to France by the preliminaries of peace arranged at Versailles 26th February 1871. The strategical importance of B. was recognised by France on its cession by Austria in 1648, and it was fortified by Vauban. At the outbreak of the war between France and Germany in 1870, B. was a fortress of the first rank; and as such maintained, from 3d December 1870 till 16th February 1871, a gallant defence against the German troops. It then capitulated, the defenders being permitted to march out with all the honours of war. B. was also besieged by the allies in 1814. B. has a brisk trade. Pop. (1872) 7910.

BELFRY (Fr. *beffroi*), a word of doubtful origin; a bell-tower, or turret, usually forming part of a church, but sometimes detached from it—as at Evesham and Berkeley, in England, and still more frequently in Italy. See CAMPANILE. Where a church was built in a deep glen, the belfry was perched on a neighbouring height, as at St Feve and elsewhere in Cornwall, and at Ardclach and Aldbar in Scotland. At this last place, the bell was hung upon a tree, as was common enough in Scotland at the close of the 17th c. Where the B. consists of a mere turret, it is often called a *bell-gable* or *bell-cote*, and is always placed on the west end of the church; a smaller one being sometimes placed at the east end, which is for the sanctus bell, for which reason it is placed over the altar. Municipal belfries are more common on the continent than in this country. When the burghs began to rise into importance after the 12th c., they asserted their right to have bells to call the burghers together for

council or for action. Thus detached belfries arose in the heart of towns. At a later date, they often became part of the *maison de ville*, or town-house, as

Belfry or Bell-gable, Idbury, Oxfordshire.

at Glasgow and Aberdeen, in this country; at St Quentin and Douai, in France; and at Brussels, in Belgium.

BE'LGÆ, the name given by Cæsar to the warlike tribes which in his time occupied that one of the great divisions of Gallia which embraced part of the basin of the Seine, the basin of the Somme, of the Scheldt, of the Maas, and of the Moselle, which itself belongs to the basin of the Rhine. Their country was level, containing no mountains of any height, except the Vosges in the south. The name seems to have originally designated several powerful tribes inhabiting the basin of the Seine, and to have been afterwards used by Cæsar as a general appellation for all the peoples north of that river. These B. were, in all probability, chiefly of Celtic origin, but within their territories were to be found both pure and mixed Germans.

When South Britain was invaded by Cæsar, he found that B. from the opposite shores of Gaul had preceded him, and were settled in Kent and Sussex, having driven the aborigines into the interior. The B. in Britain resisted for nearly a century the Roman power, but were finally forced to yield to it. Cæsar regarded them as German, but they rather seem to have belonged to the Celtic portion of the Gallic Belgæ. Certainly, none of the names of their three chief towns are Germanic. Aquæ Solis (Bath) is Latin; Ischalis and Venta (Ilchester and Winchester), British.

BELGAU'M, the chief city of a district of the same name in the presidency of Bombay, situated to the east of the dividing ridge of the West Ghauts, at a height of about 2500 feet above the sea. Its lat. is 15° 50′ N., and long. 74° 36′ E., its distance to the north-west of Dharwar being 42 miles. B. possesses a fort, which, in 1818, was taken from the Peishwa by the British. Under its new masters, the place has made considerable progress. It has a superior institution for the education of native youths, which is supported at once by the neighbouring princes, the British government, and private individuals. The average annual rainfall at B. is about 36 inches. In 1848, the citizens spontaneously subscribed a considerable sum for the complete reconstruction of their roads and lanes—a liberality which, besides drawing forth a supplementary grant of public money, roused the emulation of adjacent towns and villages. B. is one of the principal military stations of the presidency, and as such it was, in 1857, the scene of plotting, if not of mutiny, in common with Kolapore, Poonah, Satara, &c. Area of B. district, 4591 sq. m.; pop. (1872) 842,503; pop. of town, 21,455.

BELGIOJO'SO, a town of Lombardy, North Italy, pleasantly situated in a fruitful plain between the Po and the Olona, 9 miles east of Pavia. It has a fine aqueduct and castle, in which Francis I. spent a night previous to the disastrous battle of Pavia, which he was made prisoner. The Austrian general Gyulai made B. his head-quarters after his defeat at Magenta, June 4—5, 1859. Pop. 4000.
